Encyclopaedia
of the
**SOCIAL
SCIENCES**

Encyclopaedia of the Social Sciences

MORBIDITY is necessarily a vague term because its incidence and nature are largely determined by subjective experiences. Even when objectively observed and recorded, morbidity must be regarded as relative. A morbid condition may occur often, its frequency depending not only upon its nature, its causes and the susceptibility of the person affected but also upon its duration in relation to the length of the period under consideration. Morbidity is ordinarily defined as an illness or as a case of sickness or, in a narrower sense, as an attack of a specific communicable disease. Records of the incidence of attacks of illness due to disease, of acute attacks of a disease, whether accompanied by illness or not, and of the prevalence of chronic or other illness constitute the statistics of morbidity. By common usage morbidity statistics do not include data relating to the prevalence of physical and mental impairments that are not manifested in a state of illness.

Because of the indefiniteness of morbidity as a statistical unit and the absence of any demand for the registration of precisely defined sickness, there exist no homogeneous collections of statistics of morbidity comparable in size to those of mortality or natality. There is now available a considerable mass of morbidity records compiled for specific purposes and relating to selected population groups, but they are heterogeneous and cannot be combined into a single set of comparable tables.

The completeness of a record of illness is determined by the severity and nature of the illness, by the length of the period for which the informant is asked to report, by the subjectivity of the record and by the particular definition of illness used. An adult will usually remember an illness due to typhoid fever incident upon himself or his family if it occurred within the preceding 10 or 20 years; but few will recall a brief illness due to a common cold unless it occurred within a short time before the date of inquiry. Minor illness is observed and remembered with greater completeness when incident upon the informant himself than when incident upon others, even upon others in the same family.

Thus the annual incidence of illness of respiratory nature in families reported upon biweekly was about two attacks per person, whereas in families reported upon at intervals of 6 to 8 weeks it was only about 0.7 attacks per person. The annual illness rate for women reporting upon themselves was found to be 70 percent higher for respiratory conditions, 130 percent higher for nervous conditions and 8 percent higher for digestive disorders than the rates for women reported upon by others in the same household. In families in which the informants were adult males the rates of respiratory attacks were higher for the adult males than for the adult females, whereas all objective observations point to a higher rate among women than among men. Malingering undoubtedly affects the accuracy of statistics based upon records of disability or absence. Even when it is not an important factor, as in the case of two industrial establishments studied by Brundage, it has been found that "if wages are lost entirely when the worker is absent on account of sickness the record usually shows a much lower rate of absences of relatively short duration than when full wages are paid during sickness." Records of communicable diseases are incomplete, because they are reported only by attending physicians; cases not attended by physicians are rarely reported; and the physician frequently fails to report cases that are not malignant.

In spite of the difficulty of reducing illness to precise statistical unity it is measurable in fairly exact terms of specified duration, degree of disability, symptoms, causes and consequences. From the point of view of diagnosis illness is obviously of greater value for statistical purposes than is death, since the ill person is still subject to observations, from which more information can be elicited than through autopsies. Statistics of illness afford an indication of vitality that is not less significant and is more illuminating than that obtained through mortality statistics. They portray the condition of public health far more subtly than do death rates and reveal the prevalence and incidence of disease upon a people in a manner that is as useful to the student of

society as is clinical observation of the patient to the physician.

Although many varieties of morbidity records exist, they may be classified into five general groups: reports of communicable diseases; hospital and clinic records; insurance, industrial and school records; surveys of the prevalence of illness; and records of the incidences of illness in a population continuously or frequently observed.

In a strict sense reports of communicable diseases are not morbidity data, since illness is not necessarily involved. Theoretically they are collected for a specific purpose; namely, the notification of those diseases for which reasonably effective methods of administrative control have been devised. But their usefulness for epidemiological studies is limited, as the reports of most diseases are extremely incomplete and their incompleteness varies according to age. For purposes of notification of certain diseases considerable advances in morbidity reports have been made in most countries. In all the states of the United States records of smallpox, typhoid, diphtheria, scarlet fever and the most malignant diseases—plague, yellow fever, anthrax, typhus—are reasonably complete for cases attended by physicians. Reports are usually made by physicians to local health officers, who in turn report to state departments of health. Some neighboring states have reciprocal notifications. Summaries from larger towns and cities are sent weekly, and summaries from states monthly, in the United States Public Health Service, which rapidly distributes mimeographed general summaries, later published in the weekly *Public Health Reports*; this information is later used in the preparation of annual summaries and periodic special reports issued by the service. Although for many years international interchange of disease notifications has taken place through the International Health Bureau at Paris, of which the United States is a member, the diplomatic procedure is cumbersome and as a result the interchange is too slow to be of value. When the Health Organisation of the League of Nations was formed, rapid and direct interchange of reports of typhus, plague, cholera and smallpox was effected for Russia and countries on its western border. At first, independently of the International Health Bureau at Paris, various countries made statistical notifications to the League until over 50 nations cooperated. In 1921 the League established the Service of Epidemiological Intelligence, which has been pub-

lishing the *Weekly Epidemiological Report* (since 1924), the *Monthly Epidemiological Report* (since 1924) and the *Annual Epidemiological Report* (since 1922). In 1925 an eastern bureau of the League's epidemiological service was founded at Singapore. Since then this service has been greatly developed and reports are promptly received and transmitted. A working arrangement with the International Health Bureau has been effected.

Statistics of morbidity derived from hospital and clinic records are of little value in determining the prevalence or incidence of illness in a population, either in terms of a gross rate or of any specific disease. Properly made—as they rarely are—such records are valuable data for clinical studies, and they may grow in value as the tendency to hospitalization increases and as clinicians become trained in analytical methods.

The outstanding examples of insurance and industrial establishment records are the sickness experience of European social insurance systems and the records of absences on account of illness of workers in industrial establishments in the United States. The ratios, first developed in German insurance statistical practise, now generally employed in sickness insurance statistics are the following: (1) cases of sickness per 1000 life-years exposed, i.e. the ordinary morbidity rate; (2) cases of sickness per sick person; (3) sick persons per 1000 life-years exposed; (4) days of sickness per 1000 life-years exposed; (5) days of sickness per sick person; (6) days of sickness per sick case; (7) days of sickness per member-day. English actuaries, using the 1893-97 experience of the Manchester Unity of Odd-fellows, computed annual morbidity rates in weeks for different benefit periods for persons of different ages. Although the concept of illness in such records is more than usually specific because of technical and arbitrary definitions imposed for administrative reasons, the content, the meaning and the validity of the data afforded by them are subject to important qualifications. The records cover only persons well enough to be employed. In some cases only disabling illnesses are included, and in others illnesses of short duration are excluded by reason of regulations as to the waiting period or the period of disabling illness that must elapse before the patient begins to draw sick benefits. The annual rate of disabling illness among male industrial workers with a waiting period of one week was found by Brundage to be 104 per 1000, whereas the rate for males in a large public service com-

pany without any waiting period was 1044 per 1000. Data derived from insurance and industrial records and combined with proper care may yield a representative picture of the incidence of disabling illness among insured persons.

Recent compilations of morbidity tables by the International Labor Office are of interest. The annual morbidity rates in days for males in all occupations are shown for a few ages according to the five tables listed in Table I. In spite of the fact that these figures are based on sickness experience under different administrative practises the rates are strikingly close. The German Krankenkasse statistics, particu-

larly those of the Leipsic sick fund, yielded valuable data according to sex, occupation and cause. More recent are valuable contributions from American sick benefit societies, of which Table II from Brundage is an example.

School illness records have not been adopted generally as yet, although several localities have adopted the recommendations of the American Public Health Association that such records be kept. Favorable consideration is being accorded the suggestion made by Collins and illustrated by Downes, that records of illness involving absence from school, if kept with some degree of specificity as to the nature of the illness, could be used profitably to complement the findings of the usually unsatisfactory physical examinations as a method of referring certain children for diagnosis and treatment.

Illness surveys have been made, notably by the Metropolitan Life Insurance Company in the United States, to ascertain by means of a simple house to house canvass the prevalence of illness at a given date in sample populations. The results indicate that about 2 percent of the population, including persons of all ages, at home or at work, are ill. The incidence of illness within a given period is not revealed by this method and, when the results are analyzed by cause, the proportion of cases that are of long duration and of chronic type is much higher than would be shown by records of incidence.

The method of obtaining records of the incidence of illness in a population continuously or frequently observed was first employed on a considerable scale in 1916 in the Goldberger-

TABLE I

ANNUAL MORBIDITY RATE IN DAYS FOR MALES,
ALL OCCUPATIONS*

AGE	KINKOLIN'S TABLE	MOSER'S TABLE	JANSE'S TABLE	AUSTRIAN TABLE	ENGLISH ACTUARIES' TABLE
20	5.78	5.39	4.50	8.4	5.70
30	5.48	5.41	5.16	7.9	5.66
40	6.70	7.24	6.84	9.2	7.08
50	9.43	9.82	8.70	11.5	9.77
60	13.69	16.12	15.34	16.2	15.25
70	19.46	22.59	25.80	23.2	

* Kinkolin's data are based on the experience of 919 Swiss insurance funds operating in 1880. Moser's data are based on the experience of the Bernese Cantonal Sickness Insurance Fund, with an approximate membership of 11,000, covering 350,341 days of sickness. Janse's data are based on the observations made from 1888 to 1897 by the Amsterdam General Sickness Fund. The data for the Austrian table are based on the observations made from 1906 to 1910 for the Austrian compulsory insurance funds, covering an annual average membership of 2,000,000 insured persons and a total of about 95,000,000 days of sickness. The data for the English actuaries' table is a variant of the table constructed by Watson on the basis of the Independent Order of Oddfellows, Manchester Unity, from 1893 to 1897, covering nearly 3,000,000 years "exposed to the risk," and nearly 24,000,000 days of benefit.

Sydenstricker study of pellagra in several textile communities of South Carolina. The initial attempt to record on any considerable scale all illnesses continuously in a typical population was made by Sydenstricker in Hagerstown, Maryland, from 1921 to 1924. The same methods, with some elaborations, have been used in several subsequent morbidity and epidemiological studies. The most recent and extensive study which employed the Hagerstown method was that conducted from 1928 to 1931 by the Committee on the Costs of Medical Care in cooperation with the United States Public Health Service and state and local health departments. This study covered about 9000 white families observed for 12 consecutive months in 130 localities in 17 states and the District of Columbia with a total of nearly 39,000 person-years of life. The families surveyed lived in rural, urban and metropolitan areas, represented all income classes and included native and foreign born persons. An annual illness rate of 850 per 1000 persons was found. Illnesses that caused loss of time from work, school or other occupation amounted to 516 per 1000 persons and those which entailed confinement to bed for 1 or more days were 434 per 1000 persons. The principal causes of illness are summarized in Table III. Children between the ages of 1 and 10 and persons over 65 years of age living in

rural areas were found to be ill less often than such persons living in large cities, but the morbidity rate of all other ages was higher in the country than in the city, as Table IV shows.

TABLE IV

ANNUAL ILLNESS RATE PER 1000 WHITE POPULATION IN RURAL AREAS AND IN LARGE CITIES, UNITED STATES, 1928-31.

AGE	CITIES OF 100,000 OR MORE	TOWNS OF LESS THAN 5000 AND RURAL AREAS

The Hagerstown studies of the incidence of illness included inquiry into the extent to which such factors as sex, age, economic status, housing and sanitary conditions were related to cause or kind of illness. It was found that illness was most frequent and the proportion of persons suffering frequent illnesses was greatest in early childhood, lowest in the age period from 15 to

TABLE V

AVERAGE ANNUAL NUMBER OF DAYS OF DISABLING SICKNESS PER PERSON IN FAMILIES CLASSIFIED ACCORDING TO INCOME, 24 COTTON MILL VILLAGES OF SOUTH CAROLINA, 1917

WEEKLY FAMILY INCOME PER ADULT MALE UNIT	ALL AGES ADJUSTED*	UNDER 5	5-14	15-24	25-44	45 AND OVER
Under \$4.50	12.7	10.1	4.5	10.6	12.6	25.2

* Adjusted to the age distribution of the total population of the United States, 1910.

Source: Wiehl, Dorothy G., and Sydenstricker, Edgar, "Disabling Sickness in Cotton Mill Communities of South Carolina in 1917" in United States, Public Health Service, *Public Health Reports*, vol. xxxix (1924) 1426-27.

24 years and increased gradually as age advanced. Respiratory diseases were the principal causes of illness throughout life. The chief causes of illness other than respiratory in childhood were communicable and digestive diseases and conditions affecting the skin, eyes and ears; as age advanced after 25 years the chief causes were nervous and circulatory impairments, including those of the heart, diseases of the kidneys and annexa and of the digestive organs and certain diseases such as cancer and arthritis.

Emmet, using the 1912-16 experience of a large American sick benefit fund, found that disabling sickness was more frequent but not longer in duration among unskilled laborers than among skilled workers or persons in professional, trade and clerical occupation. Wiehl and Sydenstricker recorded the disabling sickness during 1917 in 24 cotton mill villages in South Carolina among several thousand white persons classified according to family income as in Table v. Although the entire population was poor, it was shown that the sickness rates for each age group rose sharply when family income reached a very low level. The Hagerstown studies furnished differential morbidity data according to economic status for a more typical general population, and showed that the illness rate among persons classified as poor and very poor was 25 percent higher than that in the group classified as well to do and comfortable. The excess in the illness rate among persons in the poorer families, however, occurred only among adults over 35 years of age. The principal diseases which caused these higher illness rates among the poor were respiratory diseases, including influenza and grippé, rheumatism and nervous diseases.

MORE, HANNAH (1745-1833), English religious writer and philanthropist. An early example of the sturdy, conservative British spinster who was to demonstrate in increasing numbers through the nineteenth century her ability to make her way without benefit of matrimony, Miss More in her twenties gained freedom to write through a financial settlement she was induced to accept in lieu of matrimony from a middle aged suitor after he had repeatedly postponed their wedding. She wintered in London for many years in the household of Garrick, the actor, who wrote the prologue and epilogue of her tragedy *Percy*, successfully performed at Covent Garden in 1777. Attractive, vivacious, witty, she became a correspondent of Horace Walpole, a valued friend of Dr. Johnson and his circle and a participant in the gatherings of the Blue Stocking ladies, eulogized in her poem *Bas bleu*. Her early interest in society, however, was diverted into more serious channels through the influence of William Wilberforce, the anti-slavery agitator, and John Newton, the London preacher. Removing with her sisters in 1785 to the home, Cowslip Green, which she had purchased near Bristol, Hannah More became actively interested in the spiritual and social welfare of the neighboring villages. Against the opposition of clergy, gentry and farmers she organized Sunday and week day schools to teach the villagers the Bible and "such coarse works as may fit them for servants," although even her interest in education did not go so far as to permit instruction in writing. Her horror at the violence of the French Revolution and the doctrines of Tom Paine was reflected in a series of enormously popular tracts, the first of which, *Village Politics*, was written in 1792. These sketches, later collected in three volumes as *Cheap Repository Tracts*, held up to the poor the virtues of contentment, frugality, sobriety and reverence for God, the gentry and the British constitution. Miss More's most popular book, *Coelebs in Search of a Wife* (1809), only nominally a novel, brought her £2000 in the first year of its English publication and ran through thirty American editions. Despite continuously frail health she lived to the age of eighty-eight, devoting her last years almost entirely to religious and philanthropic activities.

MORE, SIR THOMAS (1477/78-1535), English humanist and statesman. In spite of his skepticism regarding the compatibility of philosopher and prince More was persuaded to enter the service of Henry VIII and during his loyal and eminently successful career as ambassador and lawyer preserved a discreet silence in the face of a royal policy which in the main he soon came to disapprove. When the issue between king and pope became so closely drawn that silence was no longer considered an adequate pledge of loyalty, More as lord chancellor refused to renounce the head of the Catholic church and was therefore executed by royal order. In addition to being a political realist and a devoted Catholic More was a warm hearted humanist, an intimate friend of the most distinguished classical scholars of the Renaissance and an almost fanatical devotee of Greek literature and culture. He had moreover a wealth of native humor and fantasy which made it difficult for even his closest friends to single out the serious from the jocular in his flowing conversation.

More's *Utopia* (Louvain 1516; tr. by R. Robynson, London 1551) affords an insight, however deflected, into the manifold compartments of his still inquiring mind. Although his traditionalism prevented him from discerning the real significance of the cataclysmic economic transformation taking place around him, his deep humanitarianism revolted at the popular misery brought on by the enclosure movement and at the rapacity and indifference of the new plutocracy abetted by the older nobility and the royal court. Yet he was realist enough, perhaps as a result of an earlier outburst of indignation which had brought him a sharp rebuke from Henry VII, to recognize the untimeliness of an outright remonstrance. In his search for a less hazardous medium More was guided by his instincts as a humanist and by his own zest for fanciful contrivance. He shared the widespread interest of an age of discovery in remote lands and peoples, and in reading the accounts of Vespucci's recent voyages he allowed his troubled fancy to roam until it came to rest among an unknown people below the equator, who, not surprisingly, bore unmistakable resemblances to the Greeks. Modestly, not to say craftily, disguising his own self-

questionings in the picturesque garb of a Portuguese explorer "skilled in babbling" (i.e. Hythlodaye), the trusted emissary of the king set out with a less harassed mind to think through the social and philosophical issues beneath which his jocular spirits were tending to become depressed.

The enduring influence of the *Utopia* has inevitably tended to dim not a few of the values that constituted its chief charm in the eyes of the humanist circles among which it first circulated: the vigorous Latin style devoid of Ciceronian affectations; the erudite marshaling of patristic and classical sources with a view to harmonizing natural and revealed religion; the resonant echoes of Epicurean and stoic axioms; the Platonic vestments in which the author had bedecked his own humanitarian idealism; the touch of Lucian in the satiric wit turned against the more venial shortcomings of contemporary society; and above all, perhaps, the half serious, half fantastic conceits in which the beloved "Morus" had indulged his talents for the plausibly absurd. To the less amateurish utopians of later ages More has loomed increasingly large as a pioneer social reformer, if not the evangelist of a new communist order who turned the full fury of his eloquent wrath against the unscrupulous domestic and foreign policies of ruthless princes; the corrupting worship of gold; the grievous inequalities of fortune and position; the cruelty of a social system that exterminated the desperate masses by a barbaric penal code instead of alleviating the conditions which forced them to crime; the greediness of privileged orders within the church; the bewildering proliferation of legal enactments and the invocation of precedent rather than justice; military aggrandizement with its progeny of bestialized mercenaries, slaughter and helpless, maimed veterans swelling the ranks of the indigent. Others, fastening upon More's own skepticism, as expressed at one particular point very early in the *Utopia*, regarding Hythlodaye's castigation of private wealth as the prime scourge of the commonwealth, have pointed out that Hythlodaye and More are two distinct characters—and with some justification therefore have been able to pass over the former's repeated and increasingly eloquent renewal of his basic thesis and the latter's final equivocal evasion of the most crucial issue raised during the one-sided dialogue. Another school of critics, drawn mainly from the German academic world, has thrown its emphasis on scattered passages of the *Utopia*

which describe the commercial and credit relations obtaining between the inhabitants of the island and their neighbors and the utopian practise of colonizing surplus population in the unoccupied regions of adjacent countries. On the basis of such incidental fragments they have sought, with some logic and little intuition, to transform into a crafty forerunner of British colonial imperialism an essentially reactionary idealist who, beneath his enthusiasm for the new currents of humanism, strove to perpetuate the paternalistic spirit of the rapidly disintegrating mediaeval world.

MOREL, EDMUND DENÉ (1873-1924), English publicist and statesman. The son of an English Quakeress and a French official, Edmond Morel-de-Ville, Morel was born in Paris and educated in England. After serving a clerkship in an English firm with west African connections he began in 1893 his career as a journalist, reformer and authority on west African affairs. From 1901 to 1913 he fought a continuous battle for the reform of conditions in the Belgian Congo. During this period he edited (1903-15) the *African Mail* and published *Red Rubber* and innumerable articles and pamphlets which thoroughly exposed the enslaved condition of the Congo natives. He mobilized distinguished individuals, governments and public opinion on three continents against the immense vested interests headed by the Belgian sovereign Leopold II, until in 1913 the slavery system was replaced by more usual methods of colonial administration.

Morel next undertook a propaganda campaign for "open diplomacy" and published a startling exposure of the "economic imperialism" of the great powers in Morocco. On the outbreak of the World War Morel and several Liberal and Labour leaders, who felt that after proper military measures had been taken it would be well to propagandize for parliamentary control of foreign affairs and open diplomacy, founded the Union of Democratic Control. In 1917 Morel served six months in prison on a charge of sending pamphlets to Romain Rolland. In 1919 he founded *Foreign Affairs*, the organ of the union, which had considerable influence in popularizing the idea of a League of Nations. After having joined the Independent Labour party Morel was elected to Parliament in 1922, having spectacularly defeated Winston Churchill, and was again returned in the "Zinoviev Letter" election of 1924.

Manchester 1919); *Morocco in Diplomacy* (London 1912), republished as *Ten Years of Secret Diplomacy* (London 1915); *Truth and the War* (London 1916); *The Poison That Destroys* (London 1922); *The Secret History of a Great Betrayal* (London 1923).

Consult: Cocks, F. Seymour, *E. D. Morel: The Man and His Work* (London 1920); *The Public Presentation to Mr. E. D. Morel* (London 1911); Brentano, Lujo, *Der Weltkrieg und E. D. Morel* (Munich 1921); Swanwick, H. M., *Builders of Peace* (London 1924).

MORELLET, ABBÉ ANDRÉ (1727-1819), French economist and miscellaneous writer. Morellet, a churchman by formal affiliations and a *philosophe* by predilection, formed a permanent friendship with Turgot while studying at the Sorbonne and subsequently became a disciple of Gournay. He entered the circle of the *encyclopédistes*, collaborating in their venture, and as a frequent guest at the salon of Madame Geoffrin mingled with the luminaries of the Enlightenment, to whom he was recommended by a talent incisive rather than original and a caustic pen particularly relished by Voltaire. In his economic writings, which were devoted chiefly to the cause of liberating commerce and industry, he upheld Gournay's ideas, including the reservations with regard to physiocratic doctrines, with more fidelity than any other member of Gournay's group. His *Réflexions sur les avantages de la libre fabrication et de l'usage des toiles peintes en France* (Paris 1758), elaborating an economic shibboleth of the time, was followed by *Fragment d'une lettre sur la police des grains* (Paris 1764), in

which he defended unrestricted internal trade in grains and showed an inclination toward free exportation as well. Galiani's attack upon free trade evoked Morellet's *Réfutation d'un écrit intitulé . . . Dialogues sur le commerce des blés*, printed in 1770 but withheld from publication by the government until Turgot's assumption of the ministry, when it was issued to combat the ideas of Necker. In his *Mémoire . . . de la Compagnie des Indes* (2 vols., Paris 1769) Morellet assaulted the monopolistic privileges of the Compagnie Française des Indes and was rewarded with the suspension of that company's charter from 1769 to 1785. A friend of Lord Shelburne, he participated in the negotiation of the Franco-American commercial treaty of 1786. His *Prospectus d'un nouveau dictionnaire de commerce* (Paris 1769) announced a comprehensive work upon which he labored for many years but which, like his translation of Adam Smith's *Wealth of Nations*, never reached the public; the material which he collected was, however, later utilized by J. Peuchet for his *Dictionnaire universel de géographie commerciale* (5 vols., Paris 1800). After 1789 Morellet became a violent opponent of the revolutionary laws, thus dramatically emphasizing the gap between the Enlightenment and the French Revolution. He survived, however, to become a member of the Corps Législatif under Napoleon and to produce, among other works, his *Mémoires sur le XVIII^e siècle et sur la Révolution*, published posthumously (2 vols., ed. by P. E. Lecomtey, Paris 1821; 2nd ed. 1823).

MORELLEY, eighteenth century French *philosophe*. Nothing is known of Morelley's life, and his works have been frequently attributed to Diderot, Toussaint and others. His *Basiliade* (2 vols., Paris 1753) is a long philosophic poem of no great literary merit, and its ideas are better stated in his principal prose work, *Le code de la nature*, which was published in 1755, during the period when it was becoming fashionable to believe that society ought to be ordered according to principles easily discernible in nature. Whereas the physiocrats held that nature was correctly obeyed by a system of laissez faire and

Rousseau in the *Discours sur l'origine . . . de l'inégalité parmi les hommes* bewailed the loss of primitive egalitarianism, Morelly argued that the code of nature was completely communistic. Starting out from the proposition that moral evil, the essence of which was avarice, could be explained by social conditions Morelly portrayed and advocated an ideal communistic society in which it would be "impossible to be depraved." In this utopia no private property except that necessary for individual daily wants was permitted and every citizen was a public servant fed by the state and working for it according to an elaborate code, which prescribed down to the smallest detail the behavior of the entire population. Morelly described minutely the organization of the nation into families, tribes and garden cities; the architecture and layout of the cities; the conditions of work, education and marriage; the government by a hierarchy of councils composed of *patresfamilias* over fifty years old; and the precise punishment suitable for various forms of social disobedience. The sacred laws were to be engraved in the market place and learned by heart; the abiding principle of the society would be "reason wills, the law commands." In many respects Morelly's system anticipates the rationalistic utopianism of Fourier.

MORGAN FAMILY, American financiers. The Morgan family has been prominently identified with the industrial and financial development of the United States since the middle of the nineteenth century. It began its rise to power in the period when commercial capitalism was growing into industrial capitalism and the new country was commencing to import foreign capital on a large scale. As a result of these changes many merchants became investment bankers; among these was George Peabody (1795-1869), who established in London a banking firm which specialized in foreign exchange and the sale of American securities. In 1853 Junius Spencer Morgan (1813-90), who had

also been a merchant, became a partner in Peabody and Company; eleven years later Peabody retired and Junius Morgan remained in complete control, changing the name of the house to J. S. Morgan and Company.

As the American representative of his father's firm John Pierpont Morgan (1837-1913) engaged in a brokerage and banking business in New York City during the Civil War. After the war foreign capital again poured into the United States and the Morgans floated profitably many of the American issues. His power now greatly augmented, J. Pierpont Morgan in 1871 combined forces with the Drexels, who had important foreign connections. The London firm was made a branch of the newly formed Drexel, Morgan and Company, with branches in Paris and Philadelphia.

The first real test of Morgan's strength came in 1873 in the contest over the handling of the federal government loan of \$300,000,000; here he scored a partial victory over Jay Cooke (and his allies, the Rothschilds); and when a few months later Cooke was overwhelmed by the panic, Morgan's position was supreme in the field of American investment banking. Although he continued to deal extensively in foreign exchange and the sale of American securities abroad, Morgan devoted his attention more and more to domestic investment banking operations. He began also to work out and apply the technique of banking control of industry, a development made possible by its growing capital requirements, its increasingly concentrated character and the separation of ownership from management because of the multiplication of stockholders. Concentration of industrial control was paralleled by centralization of financial control; these two tendencies rapidly became apparent in the railroad field and it was here that the extending Morgan influence was first felt. The imposition of financial control was facilitated by the wholesale railroad bankruptcies of the late 1880's and early 1890's which were produced by speculative expansion, financial exploitation, disastrous competition and depression. Morgan and his partners reorganized the most important bankrupt railroads and these roads remained under the Morgan sway through voting trusts, interlocking directorates and the community of interest of dominant stockholders. By 1900 J. P. Morgan and Company (the firm name since 1895) controlled 29,446 miles of railroads and wielded considerable influence over 37,737 miles more. While

the building up of systems modified competition and restored the prosperity of the railroads, the process neither eliminated financial exploitation nor prevented such disastrous struggles for power as that between Morgan and Harriman for the control of the Northern Pacific Railroad.

At the same time the technique of financial control was being developed in the field of industry. In 1892 Morgan promoted the General Electric Company, a monopolist combination capitalized at \$50,000,000, in which two members of the firm served as directors and three as trustees. Morgan was extremely active in the combination movement which swept American industry after 1898 and assured the triumph of trustified capitalism; thus within a few years he succeeded in promoting three steel combinations whose aggregate capitalization was \$250,000,000. In 1901 came the organization of the United States Steel Corporation, whose various plants were responsible for more than one half of the heavy and finished steel output of the country. Although the tangible assets were valued at \$682,000,000, the corporation was capitalized at \$1,400,000,000. As syndicate managers J. P. Morgan and Company received \$12,500,000 in addition to their share of the syndicate profits of \$50,000,000; actually the promoters of this supertrust were given more than \$150,000,000 in United States Steel stock, if previous underwriting commissions of the constituent companies are included. Other large promotions followed, among them the International Mercantile Marine Company, an attempt at combination in the transatlantic shipping field, but this unwieldy and unprofitable enterprise crashed into bankruptcy in 1915. From 1899 to 1913 the Morgans engaged also in the flotation of foreign securities in the American market and challenged the supremacy of European imperialist interests in China.

Underlying Morgan's investment operations, promotions and financial domination over corporate industry was control of the resources of commercial banks, trust companies and insurance companies—a fusion of industrial and banking capital. The so-called Pujo investigation of 1912-13, conducted by a subcommittee of the House Committee on Banking and Currency, showed that Morgan and his partners held seventy-two directorships in financial and other corporations whose capitalization or resources totaled more than \$10,000,000,000; it was brought out moreover that the officers and

directors of four banks closely allied with the House of Morgan held directorships in other corporations with capitalization or resources of \$8,000,000,000. Other investment banking houses (and commercial banks which engaged in investment banking operations) pursued the Morgan policy: one hundred and eighty individuals representing eighteen banking institutions, the Morgan group included, held seven hundred and forty-six directorships in corporations with aggregate capitalization or resources of \$25,325,000,000.

Within this system of financial centralization Morgan wielded the power of dictatorship. He opposed bitterly Theodore Roosevelt's program of regulation, and his resentment of interference extended to strikes and unionism. "Men owning property," he said, "should do what they like with it." In the panic of 1907 he was the supreme financial arbiter. But this dictatorship was not inherent in the system and was largely the result of the transition from old institutions to new. After Morgan's death the whole technique of financial control was institutionalized under the rule of an oligarchy, with the result that John Pierpont Morgan, Jr. (1867-), for example, has never possessed the absolute powers of his father.

During the first two years of the World War the Morgan firm acted as the American bankers and purchasing agents for several of the Allied Powers. After the war the export of American capital developed on a large scale. In the years 1919-32 the House of Morgan alone floated \$2,232,000,000 of foreign government and corporate securities; in addition it was responsible for the sale of almost \$4,000,000,000 worth of domestic securities. It also engaged actively in the merger movement of 1923-29, among its promotions being the United Corporation, a holding company which controlled 22 percent of the nation's electric light and power and gas output. In 1929 the members and directors of the House of Morgan and the banks allied with it held directorships in corporations with net assets of approximately \$52,000,000,000, a sum equal to nearly one sixth of the total corporate assets of the country. This did not represent direct rule as much as the institutionalized concentration of dominant financial capitalist interests.

The rise and development of the Morgan power is historically significant in that it typifies the decay of laissez faire capitalism and the growth of monopolistic capitalism, with its

accompaniments of financial control of industry, the export of capital and imperialism.

(1913).

MORGAN, LEWIS HENRY (1818-81), American anthropologist. Morgan, a lawyer by profession, had become interested in his youth in the Seneca Iroquois who lived near his home in Aurora, New York. He defended them successfully in litigation against a company which sought by fraud to deprive the Indians of their land and as a reward was formally adopted into the Seneca tribe. His studies of their customs and social organization were, however, confined to brief visits to the Seneca reservation.

When Morgan published his *League of the Ho-dé-no-sau-nee or Iroquois* (Rochester 1851, rev. ed. New York 1922) he believed that the unilateral system of tracing relationship was unique among them; in 1862, however, when he was supervising a railroad in Michigan in which he was financially involved, he observed a similar system among the Ojibwa. This led him to infer that such kinship systems were once universal and were a clue to the solution of the question of the ethnical unity of the human race. It was in an attempt to prove these hypotheses that Morgan undertook his comprehensive collection of the kinship systems of the world, *Systems of Consanguinity and Affinity of the Human Family* (Washington 1870). Although the book did not establish Morgan's original premises, it put forward the important principle that kinship terms have sociological significance, a judgment denied by McLennan and which has been the basis of sharp controversy among anthropologists, with recent evidence substantiating Morgan.

In his preeminent work, *Ancient Society* (New York 1877), Morgan formulated his popular social evolutionary scheme which conceived of culture as having developed in a comparable manner the world over through successive stages of savagery, barbarism and civilization. On the basis of his interpretation of kinship terms as survivals of previous marriage forms he con-

tended that marriage had evolved from promiscuity through a series of progressive stages to monogamy; he recognized, however, that promiscuity, that is, the absence of any marriage regulations, was not to be found among existing peoples. Under the influence of Bachofen he maintained that descent through the maternal line universally preceded descent through the paternal line, the former passing to the latter when property increased and paternity was no longer doubtful. In discussing the development of government he contrasted as did Maine the kinship groupings of primitive societies with the territorial political affiliations characteristic of civilization. His hypothesis that primitive political life was invariably democratic led him to criticize vigorously the exaggerated accounts of the Mexican analysts.

Morgan ranks as the outstanding American anthropologist of his period. His influence upon subsequent anthropology was profound: his theories determined the character of the important researches of Bandelier and Powell in America, of Fison and Howitt in Australia, of Sternberg and other European anthropologists. Although at first subject to acrimonious criticism in England, his views on kinship later influenced Rivers and Frazer. Marx and Engels endorsed his work as supporting the materialist interpretation of history, with the result that he is universally known in socialist and communist circles. Recent anthropology has modified basically those of Morgan's theories which postulate unilateral evolution.

BERNHARD J. STERN

Consult: Stern, Bernhard J., *Lewis Henry Morgan, Social Evolutionist* (Chicago 1931), with complete bibliography of Morgan's works.

MORLEY, JOHN (1838-1923), English journalist, man of letters and statesman. During his early period as a journalist Morley was a radical, a rationalist and a republican. After his entry into politics his radicalism toned down into liberalism, his militant rationalism ceased to be noticeable and his republican sympathies were forgotten. He began his public life as a journalist under G. H. Lewes and from 1867 to 1882 he edited the *Fortnightly Review*, in which paper he published drafts of many of his best known books, including *On Compromise* (London 1874), *Rousseau* (2 vols., 1873), *Diderot and the Encyclopaedists* (2 vols., 1878) and *Voltaire* (1872) as well as the shorter studies of eighteenth century France which afterwards appeared in his *Critical Miscellanies* (4 vols., 1886-

1908). For three years (1880-83) he edited the *Pall Mall Gazette*, strongly supporting the radical element in Gladstone's government. His political outlook was clearly expressed in his *Life of Cobden* (2 vols., 1881), of the same period.

In 1883 he entered Parliament and in 1886 became secretary of state for Ireland. During his long parliamentary career he remained a staunch advocate of home rule and supported Gladstone's Home Rule Bill which split the Liberal party. At the death of Mr. Gladstone when the choice of Liberal leader lay between Lord Rosebery and Sir William Harcourt, his weight was thrown on to the side of Lord Rosebery. From 1898-1902 he was largely occupied in writing his authoritative *Life of Gladstone* (3 vols., 1903). He held office in Liberal governments preceding the World War and as lord president of the Council played a prominent part in coercing the House of Lords and procuring the passage of the Parliament Act. As secretary of state for India he was an autocratic administrator, but did what he could to "rally moderates" by a reform policy. He regarded the World War as "a heartbreaking set-back to human progress" and resigned from the cabinet with John Burns.

Morley was at his best when bringing his historical philosophy to the service of current controversies. His view of the forces making for progress and of the relationship between economic and psychological factors in history is most clearly presented in his review article on Taine's *Ancien régime* (reprinted in his *Miscellanies*). He was a consistent champion of rationalism and his opposition to clerical influence was based on his hatred of all obstacles to free thought and scientific progress. Thus his *Voltaire* and other eighteenth century studies were all "dated"—they were written in the atmosphere of the nineteenth century conflict between science and religion. In dealing, particularly in the two volumes on Diderot, with the battle of the *encyclopédistes* against eighteenth century authoritarianism he was inspired by the Darwinian battle against religious orthodoxy. He had an admirable prose style and could hit hard in controversy; in *Vauvenargues* and other essays he also showed an unusual capacity to appreciate points of view which were not his own. His limitations were clearly revealed in his treatment of Rousseau, whose eccentricities he apologizes for rather than explains. But the "advanced" writing of fifty years ago necessarily seems censorious and priggish today. He is a constantly

didactic writer: neither a philosopher nor a scholar as the Germans would use those words, but rather a *philosophe*, an enthusiastic disciple of human progress, better with his pen than in action and better when dealing with broad principles than in detailed analysis or constructive suggestion.

KINGSLEY MARTIN

Works: Works, 15 vols. (London 1921).

MORMONISM. The religious philosophy of the Latter Day Saints, more popularly known as Mormons, owes its origin to the supposed divine visions, manifestations and pronouncements of Joseph Smith, who in 1830 published the *Book of Mormon*, a supposed new Word of God. Regarded by his followers as a prophet divinely commissioned to reestablish the church of Christ, Smith officially organized the Church of Jesus Christ of Latter Day Saints at Fayette, Seneca County, New York, on April 6, 1830. At the head of the elaborate church hierarchy stood the president and his two counselors, known collectively as the First Presidency. As its first president, Smith was designated "a Seer, a Translator, a Prophet, an Apostle and an Elder in the Church." This authority was transmitted to his successors. Closely associated with the First Presidency but not in the direct line of power is the position of the presiding patriarch, a high priest, who has the power of pronouncing blessings. The holder of this office descends in direct succession from Joseph Smith. Next after the First Presidency in authority is the Quorum of the Twelve Apostles, which constitutes a traveling high council. This body advises lesser councils and acts as the supreme court of the church. In the event of the death or disability of the president the Quorum of the Twelve succeeds to the supreme authority of the presidency. There are two orders of priesthood: the Aaronic, composed of priests, teachers and deacons, who administer to temporal needs; and the Melchisedek, composed of elders, seventies and high priests, who are interested primarily in spiritual activities. The church is divided and subdivided into stakes under a local presidency

and high council, into wards under bishops and, in areas where the membership is small, into missions. At present there are 104 stakes, 1039 wards and 30 missions. One of the outstanding features in the organization is the emphasis upon service by all members holding the priesthood. Both men and women act as missionaries, donating their time and paying their own expenses.

The Mormons recognize as sources of doctrine the Bible, the *Book of Mormon* and divine revelations through appointed prophets such as Joseph Smith and the presidents of the church. They accept the Trinity and believe that God and Jesus are immortalized, glorified, resurrected Beings, with bodies, parts and passions. They believe that God's declared purpose is to bring to pass man's immortality, which is assured through the death and resurrection of Jesus. They hold the doctrine of eternal progression, which proclaims the power of man to continue to grow in wisdom and learning throughout eternity, reaching thereby a state of perfection approaching the divine. The initiatory rite of baptism may be performed by proxy for the dead. Marriage, with the ecclesiastical ceremony of sealing and performed only in a Mormon temple by ordained officials, is for eternity.

Enthusiastic missionaries carried the new gospel to neighboring states, to adjacent Indian tribes and even to Europe, and converts were rapidly won. When hostility developed, Smith by revelation directed that the headquarters be removed to Kirtland, Ohio, where a communistic organization headed by Sidney Rigdon became the nucleus of the first Mormon community west of New York. Rigdon became interested in the teachings of Robert Owen, who had founded colonies in Ohio, and undoubtedly carried over into Mormonism many features of the reformer's communistic doctrine. At any rate the most significant feature of the church in Ohio was the United Order, a communistic scheme quite similar in practice to Owenism. Each member of the church consecrated his properties to it and was then given "stewardships" over whatever he had consecrated—a farm, workshop, store or factory. Thereafter he was expected to manage the property in the interest of the whole community, gains reverting to a common fund out of which he derived a sufficient support for himself and his dependents. The panic of 1837 caught the Ohio Saints on the crest of wild speculation and they lost heavily. A general store, a sawmill, a tannery and a printing press lost money and the expenditure of \$40,000 for

the erection of a temple drained the treasury. Like many other banks, the Kirtland Safety Society Bank, a Mormon institution, closed its doors. Dissension arose, and many apostatized. To escape rising prejudices and to enable the disaffected to retrieve their fortunes in an undeveloped country which offered new opportunities the prophet led the Saints to the promised "Land of Zion" in Jackson county, Missouri, where in 1832 a small pioneer group of Mormons had settled.

The Missourians found little fault with the Mormons as individuals but were opposed to the sect as a whole. The literal preaching of such notions as that "all Israel" would be gathered in Zion on the American continent, the founding of the communistic system and the later pronouncement of the doctrine of polygamy precipitated a hostile spirit toward Mormons among "the Gentiles." The Missourians also accused the Mormons, who were radical New England abolitionists, of corrupting their slaves and attempting to break down their economic system. Fearful lest the Mormons gain political control of the country by settling in large numbers, the citizens of Jackson county began to express enmity in mob violence in the spring of 1832: church leaders were tarred and feathered, property was destroyed and Independence, the Mormon capital, virtually besieged. In October, 1833, 1500 Saints fled, chiefly to Clay county. There, and later in Caldwell county, these harrowing experiences were repeated until finally after the frightful Haun's Mill massacre of October 30, 1838, the governor compelled the Mormons to leave the state.

They moved northward into Illinois where, as in Missouri, they were at first welcomed enthusiastically. On the eastern bank of the Mississippi they built Nauvoo, the City Beautiful. Within a year and a half more than two thousand houses were erected, sawmills, foundries and factories were established and a temple begun. Within five years Nauvoo, with a population of approximately 15,000, was the largest city in Illinois. But difficulties soon arose. The leaders of the Whigs and the Democrats, who were about equally divided, each solicited Mormon support. The Saints played one party against the other in return for concessions, as a result eventually losing the confidence and support of both. In 1840 the Mormons won from a Whig legislature a municipal charter that made Nauvoo practically independent of the state government and gave the mayor, Joseph Smith,

almost unlimited civil and judicial power. The charter authorized the incorporation of the Nauvoo Legion, a military organization officered exclusively by Mormons and entirely independent of the state militia. Jealousy of such special favors was soon transformed into popular hatred, and mob violence again broke out. The prophet Joseph Smith, arrested on the charge of abrogating the right of liberty of the press, was slain by a mob on June 27, 1844. In January, 1845, the legislature repealed the Nauvoo charter. This action, followed by the discharge of Smith's assassins, encouraged the mob. The crimes of the whole country were laid to the Mormons. In September, 1845, the Mormon leaders accepted the manifesto of a commission representing the residents of nine counties and agreed to leave Illinois. Nauvoo was evacuated September 17, 1846, and the Mormons moved westward, entering Utah on July 24, 1847, under the leadership of Brigham Young.

From the beginning, agriculture was the foundation of Mormon life in Utah. Young discouraged mining, because according to his theory of socio-democratic development, which aimed at economic independence, agriculture should come first, manufacturing second and more adventurous pursuits later. To make the arid Utah soil productive, the first scientific irrigation system in America was introduced. Its success depended upon the cooperation of all members of the group, and individualistic activity was out of the question. Lands, canals and streams become communal property. Small farms and intensive cultivation were the products of this economic system.

There was organized the Perpetual Emigration Company, of which every Latter Day Saint was a supporting member, and which paid the expenses of Mormon immigrants to Utah and helped to provide employment for them on arrival. From 1849 to 1883 it assisted more than 70,000 converts to settle in Utah. To provide homes, Young planned missions or colonies in the fertile valleys of Utah, Arizona, Colorado, Nevada and Idaho. Each was headed by a bishop in full charge of economic and religious interests, who directed the surveying, plotting and distribution of land and was the lawgiver and adjudicator of all disputes. Land was distributed to individuals according to the size of the family. Material sufferings ended when the rush across the plains which followed the discovery of gold in California enabled the Saints to sell surplus produce at high prices and to purchase supplies

for almost nothing. Before the close of 1848 the Mormon population in Utah numbered 5000. During the early 1850's, hundreds joined the sect; by 1853 Salt Lake City had nearly 12,000 inhabitants and Salt Lake valley about 30,000.

Government in Utah from 1847 to March, 1849, was a pure theocracy, church and state being completely fused. As the civic problems of the new territory became more complex this form proved inelastic. The rapid influx of Gentiles established an influential minority not amenable to an ecclesiastical organization with which it could not affiliate. Recognizing this problem, the Saints organized the Provisional State of Deseret in March, 1849. Its petition for statehood was denied by the Congress of the United States, which in 1850 authorized the establishment of the territory of Utah.

Now began a half century of conflict between the Saints and the United States government. Arising from causes similar to those behind the trouble in Missouri and Illinois, this conflict expressed itself politically in the Saints' dissatisfaction with territorial tutelage which denied them the right of choosing their own civil magistrates. Gentile appointees of the federal government felt that Young as governor used his ecclesiastical influence as president of the church to encroach upon their prerogatives. These officials were considered intruders in a community conscious of its ability to govern itself. Many were men of mediocre attainments and all were likely to have little sympathy with those whose religion they despised and whom they considered fanatic and disloyal to the federal government. United States Judges Brocchus and Drummond and Indian Agent Day quit the territory and filed with the federal government incriminatory charges against what they termed the "despotism" of Young. President Buchanan in 1857, on the grounds that a state of rebellion existed, appointed Alfred Cumming to replace Young as governor and sent 2500 men to Utah. The Mormons deserted Salt Lake City and prepared to migrate southward, but on June 26, soon after the troops had passed through the vacated capital, a peace commission arrived with a signed proclamation of pardon.

On no other issue was the conflict more sharply drawn than on that of polygamy, a practise encouraged by the church because it represented a direct revelation to Smith, because it was sanctioned as a practise in Old Testament times and because, it was argued, the patriarchal family relationship was necessary as a means of

acquiring the highest attainable degree of salvation. From 1852 to 1882 polygamy was permitted to run its course, the United States government finding it difficult to control because of the inadequacy of laws and the impossibility of enforcing them. In 1879 the Supreme Court of the United States decided that no such article of faith could claim protection under the constitution; and in 1882 Congress passed the Edmunds Act, which punished polygamy by disfranchisement, imprisonment and by declaring illegitimate children born of such marriages. Fully 1200 Mormons were disfranchised. The Edmunds-Tucker Act of 1887 dissolved the corporation of the Church of Jesus Christ of Latter Day Saints; and in May, 1890, the Supreme Court of the United States (*United States v. the Mormon Church*) upheld this decree on the ground that the Mormon Church was an organized rebellion. In September, 1890, President Wilford Woodruff issued a manifesto warning the Saints against contracting any marriage forbidden by the law of the land. Then on January 4, 1893, in response to a declaration by the authorities of the church pledging the membership to faithful obedience to the laws against polygamy, President Harrison issued a general pardon to all liable to the penalties of the Edmunds and Edmunds-Tucker acts, on condition that they had not violated their provisions since November 1, 1890, and would not violate them in the future. The escheated property of the church was restored in March, 1896, but the reincorporation of the church was forbidden. The enabling act authorizing the admission of Utah to the union in 1896 stipulated that the constitution of the new state prohibit the practise of polygamy.

Church revenue, which is derived mainly from tithing, free will offerings and the income from property holdings (stores, sugar factories, salt works and the like), is used to promote colonization, maintain denominational schools, support traveling missionaries, assist in erecting temples and tabernacles and pay ecclesiastical salaries. The law of tithing, instituted by revelation immediately after the discontinuance of the United Order in 1838, defines a full tithe as 10 percent of the total income of each church member. Collection is not coercive. Many Gentiles and Mormons oppose the church's business activity as obstructive to fair competition. The completion of the first transcontinental railroad in 1869 stimulated cooperative industry and interested the church in business undertakings.

The hitherto prevalent domestic system of manufacture gave way as the railroad brought into the valley larger machinery which could be used to advantage in cooperative manufacturing institutions. Even when it was found profitable to patronize eastern industry, cooperative mercantile institutions purchased and distributed the goods. Cooperative institutions not only protected the people from eastern speculative price fluctuations but also assured church control in business and trade and the perpetuation of independent community life. In several small towns a very highly organized communistic society was developed; in others only a few industries were communally controlled. In 1869 the Zion's Co-operative Mercantile Institution was established in Salt Lake City, with branches in smaller communities. At first the purchase of stock was limited to Mormon tithe payers, nearly every one of whom, especially in smaller localities, owned stock. These institutions lowered prices generally and operated at a profit. For a few years the "co-op" held a complete monopoly of mercantile business in small communities, but the rapid influx of Gentiles and the growing complexity of industrial life forced many branches out of business. The parent institution soon admitted Gentile stockholders, who own today about 30 percent of the total stock. The church is no longer the largest stockholder. Between 1880 and 1890 Mormon cooperative activities declined noticeably.

Of recent years many of the earlier peculiarities of Mormonism which characterized its pioneering stage have been swept away. Since 1885 little or no effort has been made to establish communal societies; since 1890 polygamy has been disallowed; since 1910 there has been no serious attempt to organize politically against the Mormons as a group. As the barriers of isolation have broken down, the earlier spirit of group consciousness has subsided noticeably. As a result of these changes, a more tolerant attitude toward the sect is replacing the earlier feeling of hostility and prejudice. In 1932 the church had 688,435 members, representing a gain of 7596 converts in 1931. It had 2854 missionaries in the field and a budget of about \$4,000,000, of which \$751,200 went for the church school system and a slightly larger sum for missionary work.

MOROCCO QUESTION. Through economic and political pressure during the course of centuries Spain, France and Great Britain accumulated in Morocco various special rights of a

capitulatory nature. By the convention of 1880 signed at Madrid these were pooled and to avert future clashes ten more or less "disinterested" nations were permitted to share them. Great Britain and Germany, in 1880 interested largely as backers of Spain and France respectively, became commercially interested in Morocco on their own account. Endless trouble arose over the rights of protection and tax exemption which article 2 of the Madrid convention enabled foreigners to confer upon native Moroccan protégés. Morocco's contact with industrial Europe made it ever less manageable by its antiquated government, which went increasingly into debt to foreigners in order to pay for wars, rebellions and royal luxuries. By 1900 the Madrid settlement seemed on the verge of dying from congenital weaknesses. Most signatories were indifferent; the rest were anxious to gain the upper hand through financial control.

Informal Franco-Spanish "conversations" reached the stage of a tentative partition scheme in 1902. Touat and Colomb-Bechar on the Algerian border were taken by French troops in 1903. An Anglo-French treaty of 1904 with some secret clauses gave a free hand to France in Morocco and to England in Egypt, and France now reached a secret agreement with Spain. In two speeches at Tangier in 1905 the German emperor defended Moroccan rights as set forth in the Madrid convention and by implication the rights of all signatories. Germany's stand delayed Franco-Spanish penetration for more than a year and led to the conference of Algeciras in 1906, whose act revived the moribund convention with new arrangements and compensations to take care of changes in Morocco's status.

But phrases in the preamble about sovereignty, territorial integrity and economic freedom could not hide the fact that the Moroccan government had been seriously weakened in prestige, funds and forces. Between 1907 and 1911 France conquered nearly 6000 square miles of Moroccan territory including the richest farming district. In 1909 Germany admitted superior French political interests in exchange for a vaguely worded agreement of full economic cooperation. In encouraging the sultan in 1910 to resist a French effort to gain control of the army as well as of finances, Germany claimed that the political concessions of 1909 were naturally within the framework of the Act of Algeciras. A crisis in 1911, when the French entered Fez at the invitation of the penniless and beleaguered sultan, was avoided by France's cession to Germany of

a small piece of Equatorial Africa. Morocco was made a French protectorate in 1912. The mountainous northern zone nominally under the suzerainty of the French controlled sultan went to Spain. Italy's silence was purchased by putting into writing an old promise of a free hand in Tripoli and Cyrenaica.

Although the World War proceeded immediately from other issues, the imperial game for Morocco played a large part in shaping the alliances and sharpening the distrusts which got out of control in 1914. At Versailles Germany was forced to renounce all rights in Morocco. While since the World War Morocco has become relatively less important as a center of imperialist conflict, a new problem, that of native resistance, has become serious. Spain tried to end a succession of wars with the Jebala tribes by subsidizing their chief, Raisuli, in 1921. The Riffs now rose and within four years occupied almost the entire Spanish zone. Abd-el-Krim, Riffian leader, came to blows with France in 1925 over the latter's advance into the grain region between Fez and the Riff. A year of terrific warfare cost France about a billion francs and many thousands of casualties; Spain had already suffered far more. Abd-el-Krim was defeated and banished and the Spanish zone really pacified for the first time.

The government of Tangier has been a problem somewhat apart from that of the rest of Morocco, although the forces involved have been basically the same. The foreign diplomatic corps had come to play an important role in the city administration, and the Act of Algeciras had admitted the rights of thirteen states besides Morocco. In 1923 a settlement was reached by Spain, France and Great Britain. Other signatories of the act, notably Italy and the United States, refused to exchange their rights for so much control by these "interested powers." As a result of conferences held between 1926 and 1928 Spain received further concessions and Italy won full partnership in administration. Tangier is now governed by a legislative assembly comprising seventeen representatives of six powers and nine representatives of the native population, a commission of control made up of the consular officers, and an administrator. The nominal sovereign, the sultan of Morocco, is represented by the mendoub, who has almost absolute control over the native inhabitants. The entire legal structure is such as to place the French Moroccan administration in effective control of the nominally international government. The United States is the one great

power which still refuses to give up consular and economic rights in Morocco and Tangier deriving from the Act of Algeciras. While interest in the protection of citizens has declined in importance, that in commercial privileges has grown rapidly and the American share of the Moroccan foreign trade is about \$3,000,000 a year.

MOROZOV, SAVVA (1862-1905), Russian manufacturer and supporter of the Bolsheviks. In 1885 after graduating from Moscow University Morozov became a member of the board of directors of the largest textile factory in the Moscow region, which had been established at Orekhovo-Zuevo by his grandfather. The great strike of that year in the Morozov factory, one of the first Russian mass strikes and evaluated by

Plekhanov as the opening of a new phase of the labor movement, resulted in the dispatch of troops against eight thousand workers. Under the influence of the strike and subsequent manifestations of workers' unrest Morozov began to adopt radical ideas. By the turn of the century, when he was in control of the factory, he publicly advocated the rights of workers to form trade unions, to strike and in general to enjoy freedom equal to that of employers in the struggle for their interests. He opposed child labor, advocated compulsory education up to the age of fifteen, helped establish a workers' textile school in Moscow, aided in organizing the first workers' cooperative stores among his employees and made frequent addresses attacking the conservatism of landowners, the piracy of bankers and the lack of culture and self-confidence of industrialists. He proclaimed the justice of workers' demands and the inevitability of revolution.

Morozov and Gorky met in 1901, when the former was subsidizing the Moscow Art Theatre, and within two years they were bosom friends; through Gorky, Morozov met Leonid Krassin and other Bolshevik leaders then working "underground." In 1903 Morozov undertook to support the Bolshevik revolutionary activities with a monthly contribution of about \$1000, thus making possible the publication abroad of *Iskra* (The spark), its introduction into Russia, the purchase of arms and the establishment of the short lived legal Bolshevik press of 1905. His home and factory became centers for the concealment of literature, documents and hunted Bolsheviks. Morozov supported the Bolsheviks throughout their struggle against the Mensheviks. Early in 1905 he committed suicide in France, presumably out of fear that his relatives were about to report him to the Russian police. His large insurance policy, naming Gorky's wife as beneficiary, was in reality destined to aid the Bolsheviks.

MORRIS, ROBERT (1734-1806), financier of the American Revolution. A native of Liverpool, England, Morris migrated to America in 1747 and quickly became identified with the mercantile life of Philadelphia. During the early stages of the revolution he pursued the course

of the typical merchant and like other conservative Whigs patriotically furthered measures of defensive warfare, while striving for reconciliation with Great Britain and opposing the radical political and social changes advocated within Pennsylvania by Thomas Paine. As a member of the Continental Congress (1775-78) he was a nominal signer of the Declaration of Independence although he voted against the measure and for months afterward continued to express the conviction that it had been premature. So great was the financial reputation which Morris acquired as a result of his services with various congressional committees dealing with supplies that in 1781 he was appointed superintendent of finance and shortly afterward agent of marine. American finance was then on the verge of complete collapse. For three and a half years Morris strove heroically to save the financial structure by inducing the Congress to charter a national bank and by retrenching expenditures, raising money abroad, prodding the states into complying with congressional requisitions, reforming the currency and appeasing semimutinous troops and profiteering contractors. His aid in financing the Yorktown campaign won him the enduring friendship of General Washington, while Alexander Hamilton expressed the belief that Morris was the only man who could have kept "the money machine a-going" during those years. But his continuance in private business aroused much malicious criticism; he was never able moreover to settle his public accounts satisfactorily.

Morris attended the Constitutional Convention of 1787 but contributed nothing to the debates on the constitution. Declining the secretaryship of the Treasury under Washington he served as senator from Pennsylvania from 1789 to 1795. Here he embraced the full creed of the Federalist party and in particular gave strong support to Hamilton's fiscal policies. Meanwhile Morris was drifting toward bankruptcy in his private business. A pioneer in the China trade, a promoter of manufacturing enterprises, a speculator in public securities and bank stock, he gradually concentrated his capital in land speculation. He dealt in millions of acres in the unsettled areas of New York, Pennsylvania, Virginia, North and South Carolina, Georgia and Kentucky. But his vaulting ambitions overreached themselves. For a whole decade (1787-97), while his affairs became more and more involved, he continued to circulate his notes in larger and larger volume and at greater

and greater discounts. Ultimately he became a wild and desperate bankrupt. For three and a half years (February 16, 1798, to August 26, 1801) Morris was confined in a debtors' prison, and although released under the federal bankrupt act of 1800 he never recovered from the catastrophe.

(New York 1891); Oberholtzer, Ellis Paxson, *Robert Morris: Patriot and Financier* (New York 1903); *The Journal of William Maclay* (New York 1927), with introduction by C. A. Beard; Bullock, Charles J., *Finances of the United States from 1775 to 1789*, University of Wisconsin, Economics, Political Science, and History series, Bulletin, vol. i, no. 2 (Madison 1895) p. 117-273.

MORRIS, WILLIAM (1834-96), English poet, craftsman and social reformer. Morris was trained as an architect and was then for a time a painter but soon found his true fields of activity in literature and the decorative arts. The firm of Morris and Company, founded by him in 1861, led the way in the improvement of decorative design in many fields; and in 1890 he founded the Kelmscott Press, which was the pioneer of the revival of fine printing in England. It was mainly his interest in the arts which caused him to turn from liberalism and become one of the outstanding figures of British socialism in the early days of its revival after the eclipse of the mid-Victorian period, although hatred of Irish coercion also played a part in causing his severance from the Liberal party. As a craftsman he realized that under the existing economic conditions he was able to produce beautiful objects for only a small wealthy minority; and he also came to believe that the divorce between designer and craftsman, which had set in with the coming of capitalism, was fatal to the health of the arts. He took an immense pleasure in his own work and he could not bear to think that for most men work must be mere drudgery. He appealed for the destruction of class divisions and economic inequalities primarily in order to restore the manual arts to what he conceived to be their true position in society and in the lives of men. He disliked the machine age, although he recognized that machines ought to be used—and used more fully—in order to do the rough work of the community. He considered that modern civilization tended to keep up unnecessary needs and thus to impose endless drudgery on the poor; and he be-

lieved that under socialist conditions all the necessary work of society could be accomplished without overstrain or difficulty and most of it with actual pleasure in the doing.

In 1883 Morris joined the Democratic Federation founded by H. M. Hyndman two years earlier, and he took part in bringing it over to a definitely socialist policy. In the following year, however, he was one of those who quarreled with Hyndman, largely from a disbelief in the utility of running candidates for Parliament until the propaganda of socialism was further advanced. The seceders formed the Socialist League under Morris' leadership; but after a few years of active work, during which Morris edited and contributed largely to its organ, the *Commonweal*, the league fell under anarchist control, and Morris resigned in 1890. Thereafter he conducted from his house in Hammersmith the Hammersmith Socialist Society, in effect a discussion group which influenced many of the younger artists and socialists.

Morris in addition to his poems and romances published many writings on socialism. *News from Nowhere* (London 1891) presents his vision of an ideal society to be set up by actual revolution and thereafter to sustain itself practically without government. His socialist views are even more clearly presented in some of his essays and lectures, notably *Hopes and Fears for Art* (London 1882) and *Signs of Change* (London 1888) and in *A Dream of John Ball* (London 1888). He was a poor lecturer but he had an admirable prose style, seen at its best in these propagandist writings. Of his artistic work probably nothing is in itself absolutely in the first rank for all time; but his essential contribution to posterity was his practical working out in many fields of the relation between the arts and life and his steady insistence that it was futile to expect men to be happy unless they could find, as he did, happiness in their work.

MORRISON, JAMES (1790-1857), British politician. Morrison acquired a large fortune as a draper in London; investing much of it in land

throughout England and Scotland, he developed a special interest in transportation problems. In 1830 he entered Parliament as a liberal and voted for the Reform Bill; and except for an interval of three years he remained a member until 1847, devoting particular attention to the problems of railways and canals as related to national development. Morrison was one of the earliest and most persistent advocates of effective public regulation of railways, which he considered virtually monopolies; such regulation, he held, was necessary in order to bring about prompt reduction in rates as costs were reduced and to insure what competition in itself would not bring about, that all parts of the country should receive adequate service without waste of capital. In 1836 he sought to incorporate, in bills for railways and such public works, the condition that dividends be limited or that power be reserved to Parliament to revise and to fix rates at the end of every twenty years. The proposed measure was not accepted. In 1846, after the unfortunate results of railway speculation had become apparent, he obtained the establishment of a committee, which reported that in the interests of the state and investors there should be a board specially appointed to pass upon new railway projects, insure fair charges, prevent needless expenditure of capital and secure coordination of the lines. Partly as a result of the committee's work a board of commissioners was constituted; but because its powers were so poorly defined, this body failed to accomplish the aims which Morrison had set forth.

Morrison's diagnosis of the evils in the existing railway policy was penetrating, but his prescription of remedies was in advance not of the needs but of the dominant opinion in an age when the doctrine of *laissez faire* was in the ascendant. Adoption of his proposals might in some degree have saved England from extravagant speculation, large railway debts and the disordered development of railways, which wrought particular injury to the purely agricultural areas.

C., *English Railways: Their Development and Their Relation to the State* (London 1915); Cohn, Gustav, *Untersuchungen über die englische Eisenbahnpolitik*, 3 vols. (Leipzig 1874-83) vol. i, p. 53-60.

MORRISON, JAMES (1801-35), British labor leader. Morrison was an operative builder by trade. A self-educated leader, he came under the influence of Robert Owen but soon broke with him because he could no longer subscribe to the theory of "class harmony." He was editor of the *Pioneer*, a weekly which was for a time the semi-official organ of the builders' union and later of the Grand National Consolidated Trades Union. At Owen's behest the *Pioneer* was suspended in 1834 and Morrison dismissed. He died the following year of poverty and overwork.

Morrison has been called the originator of the syndicalist conception of class struggle. His activities were concentrated in the period of violent revolt which followed the failure of the Reform Bill of 1832 to give the promised vote to the working class. He fought both Owenism and parliamentarism, favored strikes as the best method in the class struggle and regarded the method of political reform as a means of diverting the working class from the assertion of all its rights. In the formation of the Grand National Consolidated Trades Union he saw the basis for the "House of Trades" which through its strength would give the franchise to the working class and through its influence and scope supplant the existing political system. His hopes proved illusory but his theories were revived in Great Britain with slight modifications by the Syndicalist League under Tom Mann's leadership in 1910 and by James Connolly about the same time in Ireland.

J. T. MURPHY

Consult: Beer, Max, *A History of British Socialism*, 2 vols. (London 1919-20) vol. i, p. 326-47; Postgate, R. W., *The Builders' History* (London 1923) p. 83-84, 105-08.

MORTALITY. This article will consider those aspects of human mortality that are of social significance or that are provided for by administrative machinery forming part of the social organism. The discussion will accordingly cover such topics as the frequency of deaths, that is to say, the death rate in the population; the administrative provisions for registration of deaths; longevity as measured by the mean length of life or, as it is often termed, the expectation of life at birth; the extreme life span; the gains which have been made in the course of past history in the mean length of life and the relation of these facts to the life span; differentiations in mortality according to age, sex, race and other characteristics; the classification of causes of death and the

share which the principal causes contribute to the total death rate. A due appreciation of the various social aspects and implications of death, when considered in connection with fundamental facts regarding births and migration, is basic to the study of the structure as well as the movement of population. The study of mortality is thus a major division of the science of demography.

In all civilized countries the law requires the registration of each death as a condition for the burial of the deceased. Registration is effected by filing with the proper public authority, generally the local registrar, a death certificate so framed as to furnish information concerning the principal characteristics of the deceased and the causes and circumstances of his death. The United States Standard Certificate of Death, for example, calls for the following information: sex, color or race, marital status, age, occupation, nativity, nativity of parents, primary and contributory causes of death. In many countries the law requires the certification of death by the attending physician or by the coroner or equivalent official in case of sudden death without attending physician. The official files of death certificates become the basic material from which modern mortality statistics are constructed.

The earliest mortality statistics published by the United States government, however, were based not upon death certificates but upon facts collected by the enumerators at the decennial census of the year 1850. Thereafter until 1900 the decennial census remained from decade to decade the source of official mortality statistics in the United States. Since 1900 statistics of deaths have been gathered and issued annually by the federal Bureau of the Census on the basis of current death registration. The statistical reports since the beginning of the twentieth century relate to a limited but gradually increasing area of states and cities of the United States in which deaths were satisfactorily registered. This area is called the Death Registration Area. In 1900 it embraced ten states, the District of Columbia and 153 cities of 8000 population and over in other states, covering about 40 percent of the total population of the country. The growth of the registration area of the United States has continued steadily, so that in 1932 it included forty-seven states, the District of Columbia and the larger cities of Texas, the only state for which complete registration of deaths was not available. The registration area of 1932 covered

95 percent of the total population of the United States.

The death rate is the measure of mortality. It is computed by relating the total number of deaths in a given population (excluding stillbirths) during a certain period of time, usually a calendar year, to the average number of people living in that population and during that period. The population for most computations is taken as of July 1; i.e. the middle of the year. The death rate is usually expressed as the number of deaths per 1000 persons in the population. The following is an illustration of how the death rate is obtained. In a given city of 128,142 people as of July 1, 1931, there were 1342 deaths during the entire year. The general death rate is 10.5 per 1000 population for that year, this figure being obtained by dividing the population into the number of deaths and multiplying the quotient by 1000. Although the base most commonly used is 1000 of population, in certain cases, for example in dealing with death rates from specified causes, the rates are often quoted on the basis of 10,000, 100,000 or even 1,000,000 of population.

The variation in the death rate is used as a rough measure of the corresponding variation in the general health conditions of populations at different times and in different places, provided that the several populations are reasonably comparable. We shall presently note how populations differing in certain characteristics are reduced to a more nearly comparable basis. Table 1 presents the death rates per 1000 in recent years in a number of countries where the registration of deaths is carefully administered.

The general death rate of the United States is one of the lowest in the civilized world. It compares favorably with that of England and Wales, where sanitary conditions have been under systematic control for nearly a century. It is somewhat higher than those of the Netherlands, Norway and Denmark, but lower than the rates of Austria, Italy and most other countries of Europe. The best mortality conditions prevail in Australia and New Zealand; the worst are reported in India. In Europe the highest rates are found in Russia and Rumania. But mortality conditions are rapidly improving even in these countries. Unfortunately certain countries where excessively high rates of mortality prevail, such as China, other parts of Asia, large native areas in Africa and other parts of the world, do not have sufficiently reliable registration of deaths to make possible the computation of death rates.

The general death rates, for example, those

Source: Figures for 1881-1925 are from United States, Bureau of the Census, *Mortality Statistics: 1926* (1929) pt. II, p. 34. Figures for 1930 are from Germany, Statistisches Reichsamt, *Statistisches Jahrbuch für das Deutsche Reich*, 1931 (Berlin 1931) p. 13*, 14* and from official sources.

appearing in Table I, are often called "crude" death rates, because they include deaths of non-residents and do not make any allowance for such important factors as the particular composition of the population with regard to age, sex or race. In some localities in more restricted areas the number of deaths is unnaturally swollen by the presence of hospitals and other institutions whose inmates have a mortality differing from the general population. In other places the population may contain a relatively large number of old or very young people or of some particular racial group. These are all factors that have an important influence on the death rate. It is necessary therefore to take note of these facts and to compute a "corrected" death rate, which makes due allowance for the composition of the population and furnishes a truly comparative measure of prevailing mortality conditions. It is usual to limit the correcting process to the effect of persons temporarily removed from their regular domicile and more particularly to the effect of variations in age distribution. The death rate of a community standardized for age composition is the mortality that

would occur in it if its age composition were like that of a selected standard population.

The risk of death varies widely at different ages, as indicated in detail below. Because of these wide variations in the mortality rate it becomes necessary when comparing the observed general death rate of two contrasted populations to reduce them to a common basis as regards age distribution. This is accomplished by determining for each population the age-specific death rate in successive periods of life (usually five-year age periods) and applying these age-specific death rates to an arbitrarily selected "standard population" having a given age distribution. The age-specific death rate for any quinquennium is obtained by dividing the number of deaths within the corresponding five years of age occurring in a given period of time (one calendar year or sometimes a succession of two or more calendar years) by the population comprised within the same age limits. If the basis of computation is more than one calendar year the population which figures as the denominator of the fraction thus formed is the sum of the populations in the successive calendar years under

consideration. For convenience the quotient obtained as described above is then multiplied by 1000 to express the age-specific mortality as a rate per 1000.

The accompanying graph shows the age-specific death rates by sex for the United States in 1930 for certain five-year and ten-year periods of life. The graph presents to the eye better than any mere tabulation can the general course of mortality throughout human life. The curve showing the relation between mortality and age is roughly U shaped. It starts at a high level on the left, indicating the high mortality of about 76 per 1000 among boys and 60 per 1000 among girls in the first year of life. It then descends steeply, showing that this high mortality very quickly abates as the child outgrows infancy. By the time age ten is reached, mortality is at its lowest point; that is to say, less than 2 per 1000 per year. Then follows a rather long stretch of years, adolescence and maturity of life, during which the mortality remains at a relatively low level, increasing only gradually until about the fortieth year of life, when the mortality is in the neighborhood of 6 per 1000. From this point on the increase of mortality with age is a little more accentuated, the second limb of the U shaped curve turns upward and after age sixty the in-

crease of mortality with age is quite rapid, rising from about 25 per 1000 to about 54 per 1000 at age seventy and to well above 100 per 1000 after age seventy-five is reached.

On the basis of the age-specific death rates obtained as indicated above, the standardized death rate for persons of all ages combined is now computed by applying these age-specific death rates to the corresponding age groups of a standard population, summing the total deaths at all ages and dividing by the total standard population. The quotient so obtained is the standardized death rate per head of the population. When this is multiplied by 1000 or other suitable figure, the death rate per 1000 or other selected basis is obtained. The particular standard population employed is fundamentally arbitrary, but the one in common use is that of England and Wales in the year 1901. Separate standards may be employed for males and females except when comparison is to be made between the two sexes themselves. In that case a common standard must be used for both, and the obvious standard to use is that for persons of both sexes combined in England and Wales in 1901. The methods for effecting these various corrections may be found described in detail in any one of the standard textbooks on vital statistics.

The trend of mortality has been continuously downward for a hundred years since death registration was instituted in England in 1836. The marked improvement of sanitation and standards of living and the advances made in therapeutic and preventive medicine which have characterized the last century have been reflected in the falling death rates. There has probably never been a period in the history of man when life was so safe for the average person as at present. It is necessary to point out, however, that the reduction in mortality during the last century has been very definitely concentrated in the first half of life and more particularly at the younger ages. The deaths of infants always constituted a very large part of the total mortality and this condition prevailed until comparatively recently. Today in the United States infant mortality has to an extent been brought under control. The infant mortality rate, that is, the number of deaths of children under one year in any year per 1000 live births registered in the same year, has been brought down to about 62 per 1000, in contrast with rates of 100 and more prevailing at the time when birth registration was first established in the United States in

1915. In some parts of the world, where life is more difficult and where sanitation and public health education have had little effect, infant mortality rates of 200 and even 300 per 1000 live births still prevail. In lesser degree the age-specific death rates have declined throughout the years of childhood, adolescence and early adult life up to the middle ages of life, say age fifty. After this age among males the improvement in mortality in the last decade has been slight if any, although the facts vary somewhat from country to country. In general it may be said that there has been but little improvement after mid life and that at the older ages there is good evidence of actual retrogression among white males in the United States during the last ten years of this very period of improving sanitation and rising standards of life.

The facts set forth above are in line with the observation that there has been virtually no change in the extreme life span of man in spite of all the sanitary improvement that has taken place in recent years. In fact the human life span has changed very little within historical times. There have always been some persons who lived to the age of eighty, ninety or even one hundred years. What has changed greatly is not the ex-

treme age attained by a few but the proportion of persons who have attained higher ages and contrariwise the proportion of persons who have died early in life. The best practical measure of longevity to be used to indicate the changes that have occurred in the past is the "mean after-lifetime," or the "expectation of life," as it is often called. The "mean after-lifetime," or the "expectation of life" at birth, is the average length of life. This is computed for a group of 100,000 persons born at the same time, which is diminished gradually by deaths in accordance with the current rates of mortality at each year of age. The complete picture of the mortality, from birth until all have died, of such a group of 100,000 persons is called a life table. A complete life table comprises columns showing the survivors to each age, the mortality at each age and the corresponding expectation of life. Table II presents a life table computed for the United States (Original Registration States) for the year 1930, reproduced from a paper presented before the American Association for the Advancement of Science, December 26, 1932, by Louis I. Dublin and Alfred J. Lotka of the Metropolitan Life Insurance Company.

A figure often confused with the mean length

of life is the average age at death. In a stationary population, that is, one in which birth rate and death rate just balance and which is not subject to either immigration or emigration, the mean length of life and the average age at death are equal. But otherwise this is not true. For example, in 1922 among males in the United States death registration states the average age at death was 44.1, but the mean length of life was 56.9. Thus it would be greatly misleading to accept the first of these figures as representing the mean length of life.

Some of the salient points in the history of the prolongation of life are set forth in Table III with special emphasis on the United States and England and Wales; the inhabitants of the latter are in a sense the next of kin to those of the former, a fact which makes roughly possible the completion of the very short American data by extending the record back to the earlier part of the nineteenth century. Some of the earliest life tables mentioned in this synopsis are mainly of

historical interest, as at the time of their preparation the technique of life table construction was not fully understood. So, for example, the first life table extant, Edmund Halley's table for Breslau, represents at best a very rough approximation of the truth.

Aside from this broadly synoptic table there are also shown in greater detail in Table IV the figures covering that period in the United States for which reliable death rates and life tables have been constructed by the Bureau of the Census; namely, the years 1901, 1910 and 1920. This table also gives figures for 1930 according to the life tables by Louis I. Dublin and Alfred J. Lotka cited above. The data here refer throughout to the Original Registration States in order to make the figures strictly comparable, even though in choosing this restricted area the benefits available in more recent years from statistics of deaths in a materially enlarged registration area have had to be sacrificed.

The figures presented in Table IV are very in-

TABLE IV

EXPECTATION OF LIFE OF WHITES, 1901-30, UNITED STATES, ORIGINAL REGISTRATION STATES OF 1900

		AT THE AGE OF									
		0	10	20	30	40	50	60	70	80	90
Expectation of life in years

* Figures with a minus sign denote losses.

Sources: Figures for 1901 and 1910 from United States, Bureau of the Census, *United States Life Tables, 1890, 1901, 1910 and 1901-10 (1921)* p. 64-75. Figures for 1920 from United States, Bureau of the Census, *United States Abridged Life Tables, 1910-20 (1923)*, interpolated for decennial ages by the Statistical Bureau of the Metropolitan Life Insurance Company. Figures for 1930 reproduced from "History of Longevity in the United States," paper presented before the American Association for the Advancement of Science, Section K, December 26, 1932, by Louis I. Dublin and Alfred J. Lotka of the Metropolitan Life Insurance Company.

structive. It will be noted that up to and including age twenty white males show a steady increase in the expectation of life throughout the period 1901 to 1930. At ages forty to seventy the year 1930 exhibits a loss over 1920 but a gain or no change as compared with previous years. Among females there are gains, in some cases very slight, at each year of life shown in the table for 1930 as compared with any of the previous years.

The systematic classification of causes of death is a comparatively recent development. As late as 1893 no two countries in the world employed precisely the same forms and methods for the classification of causes of death. This lack of uniformity rendered it impossible to make valid comparisons between statistical data of different countries. At the meeting of the International Statistical Institute held at Chicago in 1893 Dr. Jacques Bertillon, the French demographer, presented a draft of a classification of causes of death for international use. This list was an outgrowth of a previous classification designed by the English demographer Dr. William Farr, who had started work on this project as far back as 1853. Several countries promptly adopted the 1893 draft and an international system of classification thus arose. The United States Census Bureau adopted this International Classification of Causes of Death in 1900; England did so in 1911. Periodic revision of the international list in order to keep it in line with medical progress has been provided for through the so-called International Commission which met in Paris in 1900, 1909, 1920 and 1929. By 1932 thirty-nine countries and dependencies had adopted the international list and published their official reports on causes of death in the rubrics required by this list.

Although much has thus been done toward establishing international mortality statistics on a uniform basis, the task is far from being completed. In one respect particularly the state of affairs is still very unsatisfactory. In a large proportion of cases the death certificate reports more than one cause of death. In such cases there is no uniformity of practise, even within the United States itself, as regards the preference to be given to one or another cause for purposes of classification. Until provision is made for this, serious difficulties will remain in the way of making adequate international comparisons for individual causes of death. The latest classification, that of 1929, embraces two hundred main titles, to each of which is assigned a definite code num-

ber; typhoid fever, for example, is number one and tuberculosis of the respiratory system is number twenty-three. The following are the eighteen large categories set up in this fourth revision of the International List of Causes of Death:

I	Infectious and parasitic diseases
II	Cancers and other tumors
III	Rheumatic diseases, nutritional diseases, diseases of the endocrine glands and other general diseases
IV	Diseases of the blood and blood making organs
V	Chronic poisonings and intoxications
VI	Diseases of the nervous system and of the organs of special sense
VII	Diseases of the circulatory system
VIII	Diseases of the respiratory system
IX	Diseases of the digestive system
X	Diseases of the genito-urinary system
XI	Diseases of pregnancy, childbirth and the puerperal state
XII	Diseases of the skin and cellular tissue
XIII	Diseases of the bones and organs of locomotion
XIV	Congenital malformations
XV	Diseases of early infancy
XVI	Senility
XVII	Violent and accidental deaths
XVIII	Ill defined causes of death

Table v presents for 1929 and 1930 a list of selected causes of death for the United States with the corresponding number of deaths and death rates per 100,000. It will be noted that the most important cause of death is diseases of the heart. Deaths from this cause far outnumber those from any other single cause, being more than double those from cancer, which comes next in order of frequency. Diseases of the heart and cancer are followed as to frequency by chronic nephritis, pneumonia, accidents, tuberculosis, congenital debility and malformations and influenza.

The situation regarding the relative rank in the causes of death has been much changed in the last generation by the progress made in preventive medicine, sanitation and public health administration. The decline in the death rate has been accomplished very largely through preventive measures resulting in the reduction of mortality from such causes as tuberculosis, the communicable diseases of childhood and other diseases, such as typhoid fever and malaria, con-

TABLE V

NUMBER OF DEATHS AND DEATH RATES BY PRINCIPAL CAUSES OF DEATH IN THE UNITED STATES REGISTRATION AREA, 1929 AND 1930

CAUSES OF DEATH	NUMBER OF DEATHS		DEATH RATES PER 100,000 ESTIMATED POPULATION	
	1930	1929	1930	1929
All causes *	1,343,356	1,386,363	1133.1	1191.9
Typhoid and paratyphoid fever	5,698	4,854	4.8	4.2

Excessive heat (burns excepted)	1,487	500	1.3	0.4
Other external causes	56,917	†	48.0	†
All other defined causes	100,655	†	84.9	†
Unknown or ill defined causes	24,864	24,258	21.0	20.9
Supplemental				
Mine and quarry accidents	2,560	2,766	2.2	2.4
Machinery accidents	2,064	2,281	1.7	2.0
Railroad accidents	5,773	6,769	4.9	5.8
Collision with automobile	1,760	1,958	1.5	1.7
Other railroad accidents	4,013	4,811	3.4	4.1
Street car accidents	1,174	1,439	1.0	1.2
Collision with automobile	463	507	0.4	0.4
Other street car accidents	711	932	0.6	0.8
Automobile accidents (excluding collision with railroad trains and street cars)	29,080	27,066	24.5	23.3
Other transportation accidents ††	2,764	†	2.3	†

* Exclusive of stillbirths.

† Includes tabes dorsalis (locomotor ataxia) and general paralysis of the insane.

‡ Not comparable.

*† Includes deaths from this cause where the accident occurred in a mine or quarry, by machinery or in connection with transportation.

†† Includes air, motor cycle and water transportation accidents.

Source: Provisional Summary of the United States, Bureau of the Census, Division of Vital Statistics (newspaper release of June 9, 1932).

veyed by definitely established carriers. The advances in modern antisepsis, aseptic surgery and medical treatment have also contributed their share in diminishing the general death rate; especially notable in this connection are successes achieved in the treatment of diphtheria, pernicious anemia and other diseases. On the other hand, the essentially stationary position of mortality after mid life reflects our failure in the battle against cancer and the degenerative conditions, especially diseases of the heart. It is because of this varying success which medical science has had in dealing with different causes of death that their relative rank varies from epoch to epoch.

In view of what has been said above it must be clear that some degree of further change in the life table and in the relative frequency of the different causes of death may be looked for. It will be a long while before the limit of human

capacity in reducing mortality is reached. Still further declines may be expected in the mortality from tuberculosis and from the infectious diseases, which are fundamentally preventable and which are coming more and more under control. This is especially true of the diseases of childhood. It must be admitted, however, that the bulk of the saving thus possible has already been accomplished.

Unless altogether unforeseen discoveries in the field of medicine should open up entirely new prospects, reasonable expectation must stop at a mean length of life of about seventy years, which, it is believed, may be attained at a period not more distant than about 1970. At that time the population of the United States for want of additions by immigration as in the past and because of the declining birth rate will become stationary; that is, the birth rate and death rate will balance at about the mortality which is con-

sistent with an expectation of life of seventy years, namely, 14 per 1000.

Almost all progressive nations as well as many local units publish annual reports detailing their mortality experiences; for these the official bulletins should be consulted.

MORTGAGE. The history of real property mortgages presents one aspect of the history of money and credit. Demands for money and credit have been met by counterdemands from lenders, of which the most important has been the assurance of prompt repayment. Chiefly in response to this demand, scribes have plied their mortgage forms; while, in behalf of the borrower, courts and legislative authorities have declared against undue forfeitures and have accorded rights of redemption.

Three general "stages" are customarily accounted for in reporting the evolution of the real property mortgage as an accessory of credit transactions. These three stages of evolution, however, do not explain the chronological transition of a transaction of uniform identity. Either the lack of ingenuity or conservatism of scribes in providing new forms for new functions quite universally led them to borrow old forms, especially of sale and conveyance, and revamp them to the purposes of mortgages. This tradition has given a certain hue of historical continuity and cosmopolitanism to the development of real property mortgages.

The first stage in the development of the real property mortgage is typified by the Roman *fiducia*. This mortgage transaction is reported as having consisted of a primary conveyance (*manipatio* or *in jure cessio*) absolute in form of ownership. A separate collateral agreement (*pactum fiduciae*) recited the lender's obligation to reconvey upon satisfaction of the debt. The lender took possession pursuant to the primary conveyance unless he allowed the borrower to retain possession as upon a tenancy at will (*precarium*). Apparently, even early in the history of the *fiducia*, the debtor was accorded a right of restitution of the property upon payment. If the creditor, however, had disposed of the property to a third person, as he could by reason of the primary conveyance, the borrower was accorded a personal action upon the *pactum fiduciae*. The lender's power of foreclosure seems to have been restricted, at least in earlier times, to the retention of the property, especially if the debt were not payable at a stipulated date. Nevertheless, in time the creditor was allowed, when enforcing his personal claim, to have the land sold as upon execution, whereby his obligation of restitution was dissolved and the borrower's redemption rights were extinguished. In later practise a forfeiture clause (*lex commissoria*) was incorporated in the *pactum fiduciae* for the benefit of the lender; but by the time of

Constantine the illegality of this clause was established. Under still later practise a power of sale (*pactum de vendendo*) was incorporated in the *pactum fiduciae* in behalf of the lender. Sale, after notice, was allowed under this power upon default of the debtor. The lender appears to have been accountable to the debtor for any surplus proceeds as well as for rents and profits received while in possession. The *fiducia* appears to have persisted down to and probably after the close of the classical age.

From this account of its form the *fiducia* appears to have been strikingly similar to the Anglo-American land mortgage transaction known as the deed-absolute-in-form mortgage (frequently called an "equitable mortgage") which is in current use in most of the American states. If a deed of primary conveyance is given pursuant to an agreement between the parties that it is for security, it is subject to foreclosure and redemption like other forms of mortgage transactions. Even if the security agreement is oral, these remedies lie, subject to special burdens of proof in redemption cases at least as to the existence of the security agreement. Even against a third person, these remedies lie unless the party is specially protected as a bona fide purchaser or by a recording act.

The earliest stages of Germanic mortgage tradition embraced the proprietary and usufruct gages. The proprietary gage was a primary conveyance of ownership of the land; but, as distinguished from the *fiducia*, it purported to be only a "conditional investiture" of seisin—generally upon condition subsequent—that the conveyance terminate upon payment of the debt. Prerequisite consent of family and of lord of the borrower are supposed from an early date to have affected adversely the use of this type of real property security. The usufruct gage, known as the *ältere Sätzung*, consisting of a primary conveyance of rent and profits of the land, proved more acceptable, appearing in German history around the twelfth century. The later French *engagement*, corresponding to the *ältere Sätzung*, is reported to have been in general usage in France by the Frankish period. In accord with Germanic tradition the documents in both classes of gages were executed with formalities before a public official. The *ältere Sätzung* consisted of a primary conveyance which recited the character of the mortgagee's estate; namely, that it was a seisin as of gage (*ut de vadio*). Thus in neither the Germanic proprietary nor usufruct gages did the mort-

gagee acquire the powers of ownership as was the case with the *fiducia*. While these mortgage transactions contemplated surrender of possession by the borrower, a "hirer's" possession might be arranged with the lender. Originally, under the usufruct gage, unless it was otherwise agreed, the earnings went to the mortgagee, apparently without any accountability. This characterized the particular gage as the dead gage (the *mortgage* in French law). But, at least after its disapproval by the church for usury, a transition to the live gage (the *vif gage* in France) took place, whereby earnings were applied upon the debt, as was true under the Roman *fiducia*. In the absence of forfeiture provisions the gage apparently endured as a perpetual charge upon earnings and was redeemable at the pleasure of the debtor without power in the mortgagee to foreclose the right of redemption. Since only a seisin *ut de vadio* passed to the mortgagee he could not convey more to third parties. In later usage forfeiture provisions were provided for the lender (forfeiture gages) whereby the content of the primary conveyance, whether of land ownership or only of usufruct ownership, might become forfeited to the mortgagee upon non-payment of the debt as therein provided. Apparently special agreement was necessary to require the mortgagee to pay any surplus value to the debtor or to enable the mortgagee to hold the debtor for any deficiency. Provisions for sale upon default in payment of the debt (sale gage) were also incorporated in behalf of the lender for foreclosure purposes. In Germanic practise apparently this power was exercised through a judicial sale and required notice to the debtor.

The second stage in the development of real property mortgages is commonly associated with the *pignus* of Roman law, which appears to have embraced a general category of mortgages of both movables and immovables. As a land security transaction it was distinct from the *fiducia* in that the formal primary conveyance in the case of the latter was not employed. Accordingly, as a matter of document, technical ownership was retained by the debtor. Possession is supposed to have been surrendered to the creditor, but it may be doubted if this was the actual practise in the case of real property.

The Roman hypotheca is universally cited as typifying the third stage in the development of real property mortgages. It was predicated upon non-formality as to a primary conveyance and upon the retention of possession by the borrower. It is popular to glorify the hypotheca for

this combination of informality with debtor possession, even though the Roman system, at least for the greater part of its history, provided neither registration nor other formal method of making public outstanding mortgages. This want of publicity was aggravated by the "general mortgage" of Roman law—a hypotheca of not only presently owned assets but also of future acquisitions, both movable and immovable.

In Anglo-American legal history and, not infrequently, in current American usage the hypotheca, as it was used with respect to specific, presently owned property, has its approximation in executory agreements to mortgage or to give security. When such agreements are in writing, they may be specifically enforced (or foreclosed) as an "equitable lien," except against third parties entitled to protection by reason of recording acts, or as *bona fide* purchasers. The Roman general mortgage suggests the after-acquired property clauses, including income clauses, which are common in American farm and large corporate mortgages.

In Germanic tradition a transition comparable to that from the *fiducia* to the hypotheca was duplicated by the change, probably about the thirteenth century, to the *jüngere Sätzung* from the earlier *ältere Sätzung*. Similarly, in French law the *bond* is observed to have followed the *engagement*. The later transactions did not contemplate surrender of possession by the borrower, and the content of the primary conveyance was significantly changed. The *jüngere Sätzung* was constructed upon a primary conveyance which consisted of an anticipatory or provisional subjection of the property to satisfaction of the debt upon default by the borrower as by levy of execution. This new content of the primary conveyance was an adaptation to security purposes of judicial procedure for execution against lands. Indeed the *jüngere Sätzung* has been called the execution gage. The usufruct gages faded from general usage, and forfeiture gages are said to have been entirely superseded. Formality of execution of the documents before public officials was required, as was recordation. But these requirements largely disappeared from the fourteenth to the sixteenth centuries with the reception of Roman law. The Roman general mortgage was accepted also in German usage and appeared as the general *bond* in French law. Since the seventeenth century, however, the trend of Germanic legislation has been to return the mortgage transaction to the ancient requirements of formality, including official de-

termination of the formal validity (the *Legalität*) of the transaction and recordation. The general hypotheca likewise has been displaced by the principle of specialty. In French law, however, the general *bond* is still retained to a limited extent.

In early England duplicates of the Germanic usufruct gages were also in use. In the twelfth century there appeared the so-called Glanvillian gage, which consisted of a primary conveyance with a condition for reconveyance upon payment written therein. The lender took possession in absence of special agreement with the debtor. Later English history records the Bractonian mortgage, a conveyance for years with provision that the term should become a freehold upon default of the debtor.

The Anglo-American classical, or common law, mortgage was developing along with the Glanvillian and Bractonian transactions; its acceptance was assured at least by the time of Littleton. As a matter of document it departed from the earlier gages and from the Bractonian mortgage, in that the primary conveyance embraced the ownership or title to the land. This conveyance, however, was (and still is in American usage) expressly upon a condition subsequent; namely, that it should be void upon due payment by the borrower. In early English common law forfeiture for prompt payment on the due date is said to have been automatic—at least this was generally feared.

Predicating its action upon traditional conceptions of injustice respecting such forfeitures, the Court of Chancery intervened to allow the mortgagor to redeem his property even after default by payment of principal and accrued interest. By the end of the first quarter of the seventeenth century this relief for mortgagors was regularly assured; that is, without any necessity of proving special hardship. With this new remedy came a new "estate" in land with new market values. Remedies of foreclosure, however, were accorded contemporaneously in Chancery whereby, upon default by the mortgagor, the mortgagee could procure a decree that unless the debt were paid within a time stated the mortgagor should be forever barred and foreclosed of his "equity of redemption." If the debt were not paid within this redemption period, the mortgagee took the land on account of the debt. When the land exceeds the mortgage debt in value the mortgagor is an obvious loser. This procedure, called "strict foreclosure," is still available in several American states. But the

rule has always been maintained by the English Chancery that an equity of redemption can never be forfeited or "clogged." The maxim has been "once a mortgage always a mortgage" until valid foreclosure.

Current summaries of learning upon the "nature" of the "mortgage" in modern American law are wont to make a threefold classification of American states. Certain states are called "title theory" states, that is, they declare that the title to the land passes to the mortgagee upon execution of the mortgage document; some are said to have the "intermediate theory," by which the title does not pass to the mortgagee until default by the mortgagor; while in others the "lien theory" is considered to have triumphed, that is, it is said that the mortgage creates only a lien or encumbrance upon the land and does not involve a transfer of title. The lien theory is supposed to have its precedent in the law of the English Chancery, whereas the title theory is traced to the English common law courts. Perhaps the intermediate theory may be characterized as distinctly American. The statutes and decisions, however, which make up the law of mortgages of the American jurisdictions cannot usually be correspondingly classified. A title theory jurisdiction may well reach the same decision on a given issue as a lien theory or an intermediate theory state. The fundamental theory is followed with fair consistency only with regard to problems involving the respective rights of mortgagor and mortgagee to possession. Probably there is as much uniformity of decision throughout the total jurisdictions upon most cases in mortgages as there is in other fields of American law.

Again, the foregoing classification of jurisdictions ignores the not inconsiderable variety of mortgage forms with varying terms, conditions and purposes. Apart from those already described, there is the statutory "short form," which is a statutory simplification of the common law form, and the deed of trust mortgage, whereby property is conveyed to a trustee to hold and supervise as security for the benefit of note holders or bondholders. This type, while generally used in larger financing, such as of railroads, is likewise used in smaller transactions. Indeed in a few American jurisdictions it is more popular than any other form of mortgage. The "mortgage," therefore, in a factual sense, signalizes only a general category. Identification of the particular mortgage transaction and its terms, conditions and purposes is still

important in determining a question of mortgage law. The purposes of the particular transaction are important, whatever form of document is used and regardless of theory. If, for example, security of "purchase money" is sought, there is a wide variety of legal rules specially applicable; the same is true in the case of mortgages to finance building and construction and in that of refinancing or refunding mortgages.

Again, the borrower and lender as well as the lawyer must not be unmindful that "foreclosure," and "redemption" remedies of mortgages in the several American jurisdictions are only names for generic and varying procedures which are not readily classified. In some jurisdictions a power of attorney incorporated in a mortgage authorizing the mortgagee or trustee to sell the property upon default is invalidated, while in others it is allowed, subject, however, to various requirements of "fairness." The situation is similar in foreclosure by action. In some jurisdictions foreclosure may be by writ of entry or by strict foreclosure. Procedures vary in these states for ascertaining deficiencies and surpluses. If the mortgage so provides, the mortgagee may be restricted to foreclosure of the land, in which case there will be no claim for any deficiency. In some states foreclosure by sale is generally required. The property is sold at judicial sale and the proceeds paid to the mortgagee to apply on the debt. Various "rights to redeem" from such sales are accorded the mortgagor. In some jurisdictions statutes require that foreclosure shall be prosecuted before an action can be maintained for personal judgment against the mortgagor. In others both proceedings may be maintained contemporaneously. In fact in most American states no single method of foreclosure is exclusively available. These variations in remedies bear heavily upon the price of mortgage money, the price of junior mortgage financing and the "values" of "equities of redemption." It is especially insignificant in this connection to determine as a matter of legal doctrine the nature of the mortgage.

In England the real property acts of 1925, involving comprehensive reforms of English real property laws generally, undertook to resolve the duality of estates under mortgages which continued to exist despite the supposed union of law and equity under the Judicature Acts of 1873-75 and to give the mortgagor as well as the mortgagee a legal estate under a mortgage of a legal estate in land. It was enacted that a fee

simple estate might be mortgaged by either one of two alternative methods: the borrower might execute a long term lease upon the land to the mortgagee with condition for its "cesser on redemption," or the borrower might deed a charge upon the land to the mortgagee expressly providing that it was by way of legal mortgage. These transactions are known as "legal mortgages" to distinguish them from a category called "equitable mortgages," which includes, for example, an informal executory agreement to mortgage and a deposit of his title deeds by a borrower with an informal agreement that they shall be held as security. These equitable mortgages, in turn, are distinguishable from another class of equitable mortgages which are mortgages of equitable estates instead of legal estates in land. Mortgages of legal estates less than a fee simple, especially leasehold estates, are also specially regulated in the statutes. In the case of a legal mortgage the mortgagee is apparently entitled to possession upon execution of the mortgage as of old, unless the parties agree otherwise. For foreclosure purposes the legal mortgagee has by statute a legal power of sale, under which, upon default and after notice to the mortgagor and three months delay after the notice, the mortgagee may sell the entire property. The equitable mortgagee must still bring an action to foreclose as under the practice prior to the statute. As is true in most American jurisdictions, the English mortgagor has been liable to an action for a personal judgment. There is, however, some uncertainty as to the English mortgagee's precise position in claiming deficiency by suit on the personal obligation after foreclosure pursuant to power of sale under the new statutes, because under early English decisions such action was held to reopen the foreclosure, allowing the mortgagor to redeem.

The recent legislation in England respecting real property mortgages has in the main effected only radical changes in scrivener's forms; chiefly, it seems, as an attempt to reconcile ancient doctrine and document by adding to the traditional equitable estate of the mortgagor "a" legal estate (of "reversion") and still leaving the mortgagee with "a" legal estate (that of the lease with "cesser on redemption") with a power of foreclosure extending to the total estate of the mortgagor subject to the mortgage. Professor Maitland once characterized the English "classical," or common law, form of mortgage deed as "long *suppressio veri* and *suggestio falsi*." requirements is the giving of a 3000-year lease with

"cesser on redemption" to secure a demand loan?

The German Civil Code formulates certain general classes of mortgage transactions: the ordinary hypotheca, the cautionary hypotheca, land charges and annuity charges. In content they consist of a charge upon the land and may be foreclosed only by judicial execution. They may be proprietary; they are not restricted to merely usufructuary security as was the *jüngere Säkularisation*. They are formed by a "real agreement," (that is, by an agreement of present rather than future security) with official authentication and registration. The debtor retains possession until foreclosure. Functionally the hypothecas are more comprehensive as security transactions than are the land and annuity charges. Upon foreclosure the hypothecary borrower is liable for a deficiency. A cautionary hypotheca is designated as such in the registration and is thereby made distinguishable from the ordinary hypotheca as a matter of document and public record. The cautionary hypothecary obligation is subject to those defenses which the debtor can assert against the debt. In case of the ordinary hypotheca, on the other hand, its registration carries full hypothecary rights to a subsequent "*bona fide* acquirer." *Pro tanto*, in Germanic theory, this legal consequence—the independence of the foreclosure right from the defects in the personal debt—characterizes the ordinary hypotheca as a "real right," upon which great stress has been placed in Germanic tradition. In present American law a similar consequence results where a mortgage is given to secure a negotiable note or bond. The mortgage may be foreclosed by a *bona fide* holder to whom the note has been negotiated as the note may be enforced by him, notwithstanding a defense of the mortgagor against the original payee.

As distinguished from the hypotheca, a land charge involves a "real liability" and a "real right" according to German thought in that the charge is not predicated upon personal liability of the owner of the land. The obligation matures only upon notice, which can be given either by the owner of the land charged or by the creditor. These charges, as rights in, of and to the land, may, when "certificated," circulate and be negotiated even as bearer obligations. An annuity charge is virtually a subclass of land charges. Payments, however, are made from the income of the land at recurring periods. If it is so provided, such a charge may be redeemed after

notice for such sum as is set forth in the registration; but there is no power in the holder of the annuity coupon to force redemption, except when the owner has undertaken to do so by the notice of redemption. Obviously, as financing media, the land and annuity charges contemplate long term investments as distinct from shorter terms of financing.

Under the present French Civil Code, as compared with the German, mortgage transactions assume a lesser complexity of form. The French code recognizes antichresis, under which a creditor is given possession of land to collect the income on account of the secured debt; the creditor is accountable for rents and income received, including at least fair occupation value of the premises, with credit allowed for repairs and expenses of operation, and he is liable also for taxes. A conventional mortgage of land is accomplished by a deed "executed in public form," which must also be registered. The mortgagor is ordinarily entitled to retain possession until foreclosure. The mortgage deed contemplates a charge upon the land, with foreclosure by judicial sale thirty days after a writ of demand for payment has been served upon the mortgagor. The mortgagor is liable for any deficiency upon foreclosure in the absence of special agreement to the contrary. If the mortgaged land has come to a third party, for example, to a purchaser from the mortgagor, the mortgagee must serve summons upon him also. Such party may pay the debt, or he may abandon the estate unless he has assumed the mortgage obligation. There are special proceedings, peculiar to French mortgage law, for "clearance" of the mortgage property available to such a third party. The third party may institute these proceedings either in answer to the mortgagee's writ of demand for payment or independently thereof.

Provisions for junior mortgages and priorities reveal some interesting variations in different legal systems. In American law priority is made to depend upon the date of the delivery of the mortgage subject to the requirement of recordation where third party rights are involved. Under the new English practise, however, a first mortgagee, whether "legal" or "equitable" is, for priority purposes, that one who first acquired the mortgagor's title deeds to the property. Want of recordation is not important to him. Subsequent legal and equitable mortgages, however, rank among themselves according to date of recordation. As a matter of conveyancing a sec-

ond legal mortgage, called a puisne mortgage since it is without title deeds, is created by a lease for a term one day longer than the first mortgage. A peculiarity of German law is the system of "vacant rank" when one of several mortgages is paid and discharged. The discharged security may become the owner's hypotheca or charge. Thus subsequent mortgages do not each advance a rank and are left without a direct benefit from the discharge of the prior mortgage.

MORTGAGE TAX. Under a system of income taxes the taxation of mortgages offers no special problem; the yield derived from mortgages is usually included in the general taxable income. In some countries, as, for instance, in Germany, the income derived from mortgages is subjected to an additional tax in the form of a special levy on capital earnings, on the theory that funded income presents a higher degree of taxable capacity. Under a general property tax, however, the taxation of mortgages meets with a number of difficulties: first, mortgages being a form of intangible wealth they are not always within easy reach of the assessment authorities; secondly, when reached and taxed while other forms of capital escape assessment the tax is discriminatory and is likely to be shifted to the borrower; and, thirdly, the attempt to tax the mortgage to the mortgagee and the underlying property to the mortgagor constitutes double taxation. It is consequently in the United States, where the general property tax still forms the chief constituent of state and local tax systems, that the problem of mortgage taxation has assumed special importance in fiscal practise and literature.

Mortgages have been taxed in the United States by a variety of methods. Under the general property tax in Arkansas, Illinois, Missis-

sippi (if interest rate is over 6 percent), Missouri and West Virginia they are taxable to resident mortgagees at the same rates of taxation as real estate. The impossibility of securing adequate personal declarations as to ownership of mortgages for assessment purposes and the inability to tax non-resident mortgagees have led some states to declare mortgages to be an interest in land, thereby taxing the mortgagee on the value of the mortgage at the situs of the land and the mortgagor on the value of the property minus the mortgage indebtedness. This method of taxation has been employed at one time or another in California, Colorado, Connecticut, Massachusetts, Nebraska, Nevada, New Jersey, Oregon and Wisconsin. A similar result is sought in Arizona, where mortgaged property is taxed to the mortgagor unless the mortgage is listed as personal property by the mortgagee, an event which seldom happens. In California, Connecticut, District of Columbia, Florida, Iowa, Kentucky, Nebraska (out of state mortgages), Pennsylvania, Rhode Island and South Dakota mortgages are included in the low rate taxes, with rates ranging from 2 to 8 mills per \$100, which are applicable to intangible property. In Louisiana, Montana and Maryland only mortgages on out of state property are taxable; they are assessed at 10 percent in Louisiana and at 7 percent in Montana; in Maryland they are taxed at 4.5 mills, but in Frederick county a tax of 8 percent is imposed on gross interest covenanted to be paid annually on mortgages on real estate located in that county. In Ohio mortgages, if paying no interest, are taxed at 2 mills; otherwise on an income basis at 5 percent. Income received from mortgages is taxable under the personal income tax laws in fourteen states and under corporation income taxes in eighteen states. Income from mortgages is also taxed to residents under special taxes on income in New Hampshire, Ohio, Oregon (on out of state mortgages) and Tennessee. In Massachusetts the income tax applies to income from personal property and unrecorded real estate mortgages. In Vermont mortgage income is exempt from the 4 percent income tax unless the rate of interest on the obligation exceeds 5 percent. Finally, income from mortgages is taxed under the federal income tax at the usual tax rates.

The taxation of mortgages to the mortgagee under the general property tax was often assumed to be complete because these instruments usually were recorded in county offices, where the records were easily available to the local

assessor. The negligible amounts of mortgages assessed under this tax indicate the falsity of this assumption. Their non-assessment led to a demand in some states for the adoption of rigorous listing methods. In Michigan in the late 1890's, for example, local registers of deeds were required to compile, for the use of assessors, information as to mortgages recorded. Thus the tax commission was able to increase their assessment from less than \$10,000,000 in 1899 to \$53,484,802 in 1902; assessments then declined to \$39,148,509 in 1911, when the recording tax was adopted. This decline was attributed to the removal of capital from the state, to transfers to more profitable investments and to evasion through non-resident assignments.

The consequences of the taxation of mortgages at "high" rates were seen more clearly when attempts were made to tax them as an interest in land. California followed this plan from 1879 to 1907, and in order to make sure that the tax would not be shifted to the mortgagor agreements relative to the assumption of the tax were made void by constitutional amendment. In Massachusetts and Nebraska a similar tax policy led, in spite of this precaution, to the shifting of the tax to the mortgagor and the insertion of clauses in mortgages under which the burden of the tax was so assumed. The same result occurred in California. A careful investigation of the incidence of the tax by Plehn led him to conclude that California borrowers not only paid the market rate of interest on mortgages but also paid a sum to cover the cost of shifting. In San Francisco the premium to cover the cost of shifting was estimated to be practically $\frac{1}{3}$ percent. Interest rates were found by McCrea to be higher in New York, where mortgages were taxed at high rates, than in Pennsylvania, where they were taxed at 4 mills. Matthews presented statistics tending to show the fall in the rate of interest in Boston following the repeal of the tax in 1881. Seligman concluded from the experience of New York under the general property tax that the interest rate on mortgages was increased about $\frac{1}{2}$ percent, sufficient to constitute a risk premium for getting caught. T. S. Adams investigated the problem in Wisconsin in 1903 and concluded that the size of the tax rate relative to the interest rate was fundamental in determining the incidence of mortgage taxes.

The taxation of both the mortgaged real estate and the mortgage per se as distinct pieces of property was recognized at an early date as

double taxation and led to a demand for the exemption of mortgages from taxation. It was argued that if mortgages were exempt from taxation the lower rates of interest secured thereby not only would benefit the borrower but, according to Ely, would diffuse themselves throughout the community to the benefit of all. According to Adams the exemption of mortgages in Wisconsin in 1903 did not lower interest rates to borrowers. Nor did a fall in interest rates take place in Nebraska when, in the hope of effecting a lower rate of interest and affording relief from double taxation, mortgages were taxed as an interest in land, only the excess above the mortgage being taxable to the landowner. In some instances there was an attempt to avoid the consequences of double taxation by allowing offsets against real estate assessments for all or a portion of the mortgaged debt. These provisions were greatly abused and led to the creation of many fictitious debts. By 1932 mortgages on property situated within the state were exempt from taxation as property in California, Colorado, Louisiana, Maine, Maryland (Frederick county excepted), Montana, Nebraska, Nevada, New Jersey, Oregon, West Virginia and Wyoming; in Colorado, Nebraska and Nevada the exemption applies only if the mortgagor assumes the payment of the tax on the mortgage, and in West Virginia only if the mortgage is on church property. All mortgages regardless of character and location of real estate are exempt from property taxes in Idaho, Massachusetts, Mississippi, New Hampshire, North Dakota, Tennessee, Utah, Vermont, Washington and Wisconsin; in Mississippi and in Vermont the exemption applies only to mortgages carrying an interest rate lower than 6 and 5 percent respectively. In some of these states, as, for example, in North Dakota, the exemption is contingent upon classification of mortgages as not being in competition with national banks. In Connecticut a deduction in assessment of mortgage to the mortgagee is allowed to the extent of the assessed valuation of real estate given as security. In Indiana the mortgagor is allowed an exemption of \$1000 on account of mortgage indebtedness, but no deduction is allowed which exceeds one half of the assessed valuation.

The shifting and avoidance which followed the rigorous assessment of mortgages and their taxation as an interest in land, combined with a mild repugnance against double taxation and an unwillingness completely to forego the taxation of mortgages as property, tended to pro-

mote the development of differential taxation under classification or recording devices. The low rates employed by these tax methods do not avoid but lessen the burden of double taxation under general property methods. It is doubtful if the low rates are shifted except as to recording taxes, but if shifted the burdens are nominal. The low rate taxes can be made effective only by rigorous central administration, but the recording taxes can be administered through local officers with fair success, especially if adequate penalties are provided for failure to register. The registration requirement, however, should be viewed from the fiscal standpoint as a collection device. In any case the low rate is a prerequisite to the successful taxation of this property and, short of complete exemption, the recording tax appears to be the best method of dealing with mortgages. These taxes tend to discriminate against mortgages with shorter maturities and lower interest rates than other mortgages. Methods of avoidance have been developed, but losses due to their use are probably not serious. Such taxes are found in Alabama, Kansas, Michigan, Minnesota, New York, Oklahoma, Tennessee and Virginia. They are in lieu of other property taxes in all these states except Tennessee and Virginia. The rates range from 2 cents per \$100 on mortgages with maturities of less than two years in Oklahoma to 50 cents regardless of maturity in New York. The rates are graduated according to maturities in Minnesota and Oklahoma. Six states share the tax revenues with the localities; two states retain all of the revenue; one state (Kansas) gives all of the revenues to the localities.

MORTMAIN. In the sources and literature of western history the term mortmain (in mediaeval Latin *manus mortua*, in old French *morte meyn*, in German *tote Hand*, in English dead hand) generally refers to corporations, foundations and other legal (as differentiated from natural) persons, both lay and ecclesiastical, as the owners of property, particularly land; and in a special sense "dead hand" means the Roman Catholic church, a vast legal person composed of many lesser ecclesiastical corporations and institutions, and the greatest of all property owners in mediaeval and modern times.

Dead hand, as a designation of the Roman Catholic church, originally came into usage because, by the mediaeval canon law, lands acquired by the church were inalienable. The ecclesiastical doctrine of inalienability evidently developed at an early time, for Pope Symmachus (498-514) declared that even the pope himself could not sell church property. The usual explanation of the term mortmain in connection with the church is that since the latter had in theory a perpetual existence and since moreover it could never legally alienate its lands, the latter were held as by a dead hand. They could never return to the grantor or become the subject matter of gift or sale and hence were forever lost to lay society. This meaning of mortmain was somewhat different from that which applied in the mediaeval "law of the dead," a survival from very primitive times, in which the hand of a dead man was sometimes regarded as capable of transferring property, as, for example, the heriot, the feudal tribute due a lord on a tenant's death.

In modern literature the term mortmain sometimes refers to the state or condition of

lands held by a legal person in perpetual and inalienable tenure. Indeed it generally, although not always, denotes land the possession or ownership of which is vested in any corporation; and thus the stress has been shifted from the owner to the thing owned. Furthermore the term has lost much of its original meaning, so that it frequently connotes land alienated to or for the purposes of a charity, whether or not the charity is incorporated or in a form not involving legal personality, as in the case of a charitable trust in English and American law. Since lands belonging to charities are often held by a unicorporate body of trustees, which may be perpetually continued by the fresh appointment of trustees to fill vacancies, they are thus removed from commerce and partake of the nature of lands held in mortmain. The similarity in results deriving from the two forms of holdings has occasioned much confusion not only in terminology but in legal ideas.

In the early centuries of the Christian era the problems created by mortmain were already complex; and with the passage of time they tended to become ever more involved. The primary cause was the acquisition of an enormous amount of property and especially of land by ecclesiastical corporations. Similar in character was the problem created by the holding of property by lay corporations, but in both mediaeval and modern times it was largely overshadowed by the ecclesiastical dead hand.

On the ecclesiastical side the history of mortmain represents one of the most important aspects of the struggle between church and state, or from the broadest viewpoint, the struggle between the ecclesiastical and the lay elements in society. These opposing elements represent two entirely different principles in regard to property, more especially land, one holding that lands should permanently remain at rest, as a static and immobile mass; the other that land, even though not physically movable from place to place like chattels, should nevertheless possess a dynamic quality in social development. The application of the first doctrine has meant the concentration or consolidation of lands in the dead hand, whereas the application of the second doctrine by lay society has been one of the leading factors in freeing land from its fetters and in transforming it into an energy making for social and economic progress. In the Middle Ages the two forces were represented respectively by the ecclesiastical and feudal hierarchies. Although the marked feudalization

of ecclesiastical institutions meant that they were not completely separate and independent of each other, nevertheless they indicate clearly the general divisions of interest. There was a special antagonism toward the dead hand on the part of the heirs of donors and vendors of property to the church; the towns also were hostile.

The opposition of the territorial lords was due largely to the reduction in the feudal dues to which they were entitled. Their main objection was directed against *frankalmoign* tenure (*libera elemosina*, *franche aumône*, free alms); for alienation of land to be held by this form of tenure, which was essentially alodial, resulted in a permanent loss to the lay lords. But the holding of even military fiefs by ecclesiastical persons meant a loss to the lords of many of the incidents of tenure, such as wardships, reliefs, escheats and forfeitures. Moreover the church was partially successful in establishing the claim that its constantly increasing wealth in land and goods should be completely free from taxation by temporal rulers. The exemption of church lands from taxation not only meant a serious fiscal loss but frequently resulted in an overtaxation of secular society to meet the needs, sometimes acute and pressing, of the several states of Europe. This overtaxation in many instances bore heavily upon the lower classes in society.

The mediaeval church acquired its wealth by either gift or purchase; and perhaps the earliest form of acquisition was through the last will and testament, for throughout the history of the church the clergy, by stressing the doctrine of sin and by teaching that almsgiving is the best atonement, have exercised a subtle and potent influence over countless donors. Soon after the recognition of the Christian church by the Roman state, gifts by will to Christian churches were authorized by Constantine; the Christian emperors in the latter part of the fourth century forbade legacies to churches and clerics under certain conditions; these laws in turn were repealed shortly afterward. Charlemagne's son, Louis the Pious, decreed in 817 that under pain of punishment and restoration of the property no gifts should be made to clerics if the donor's heirs were thereby disinherited. The encroachment of the church upon the rights of heirs early became and long continued to be one of the main causes of secular legislation directed against the dead hand. By the early Middle Ages the primitive law of inheritance, with its severe restraints on alienation, had suf-

ferred modification: economic progress had made a breach by diminishing the rights of heirs. In order to acquire the title to lands subject to the law of inheritance the church had to effect a further encroachment, and accordingly it worked against the law of inheritance and for freedom of disposition; slowly the ancient fetter imposed on land by the rights of the kindred was displaced by the new and far stronger fetter of the dead hand. By gift or purchase the dead hand held in the Middle Ages an ever increasing mass of property throughout Europe, and by this accumulation not only were heirs and feudal lords deprived of their rights but temporal rulers were weakened in their relations with the growing power of the church.

Legislation in regard to mortmain and secularization, both in mediaeval and in modern times, must be studied in the light of the continual struggle between the ecclesiastical and secular forces and the divergent doctrines which they have represented. The main legal remedy adopted by the mediaeval secular communities was the enactment of the laws of mortmain (*leges de non admortizando*, *Amortisationsgesetze*, statutes of mortmain), which have been retained in either their original or revised form by modern states. The rights of the church were of course limited by temporal law in each of the territorial states of Europe. Thus it early became an established principle of secular law that only when the state conferred legal personality on churches, religious houses and other ecclesiastical institutions, could they own property in their own name; hence their property rights were made to rest on the law of the state as opposed to canon law.

Although a comparative study of the mortmain laws along historical lines reveals variations from age to age and among the laws of the several countries, nevertheless in all or nearly all there have been and still are common features based on common legislative ends. Two of their main objects have been either to forbid the acquisition of property by the dead hand or to make it dependent upon the permission of secular authorities. The laws deal with either immovables or movables or with both. In general they forbid the acquisition of immovables without the state's permission, but they usually allow in the case of movables acquisition up to a certain value (*summa pragmatica*) and only require the state's special permission for acquisitions beyond this fixed amount. The regulation of acquisitions by lay juristic persons has been

on the whole a matter of secondary importance to the state.

The policy of the mortmain laws, as in Carolingian days, was partly to protect the rights of heirs; but as the struggle between church and state became more intensive, the issue became rather one of legislation against mortmain versus the loss of an ever increasing volume of the revenues of the temporal authorities, which were needed for warfare and other lay purposes. The struggle accordingly assumed largely the character of an effort on the part of the landed aristocracy and of rulers, who were also feudal overlords, to restore the lands of the church to feudal conditions.

In post-Carolingian times the earliest attempts to correct the evils of mortmain were apparently made in Spain. During the tenth and eleventh centuries gifts to the church were by custom limited to three years, after which the property could be retrieved by the heirs. Spanish ecclesiastical councils of the eleventh century protested, declaring the gifts perpetual. This led in 1102 to the prohibition, under penalty of forfeiture, of all gifts or bequests to churches except to that of Toledo. About 1125 the Cortes of Nájera extended the rule to purchases: no lands subject to royal jurisdiction were to fall into mortmain. From this time down to the middle of the sixteenth century there was much Castilian legislation against the evils of mortmain, but it proved ineffectual. Both the piety of the people, as expressed in gifts to the church, and the ever increasing greed of ecclesiastics tended to abrogate the secular law. In the seventeenth century the decadence of the monarchy was attributed largely to the growing numbers and wealth of the clergy, but efforts to enact statutes of mortmain failed. In 1713, however, Philip V annulled all legacies to ecclesiastical persons by penitents in mortal sickness and in 1737 negotiated a concordat with the Holy See by which lands acquired thereafter should be taxable. But even this agreement was continuously evaded by the church until the period of the French Revolution. In 1763 Charles III ordered that no licenses should be granted for transfers of land into mortmain even for the most pious and necessary purposes. The church, however, continued to increase its holdings and in 1793 Charles IV not only gave fresh instructions to enforce the Concordat of 1737 but in 1795 imposed a tax of 15 percent on all alienations to the church.

In thirteenth century Portugal Affonso II per-

mitted gifts and legacies to the church but allowed purchases of land only by royal license. In the early fifteenth century gifts and legacies to the church had to be sold to laymen within a year and a day, while in 1500 lands purchased under royal license were declared taxable by the king. These laws continued in force despite church opposition.

In other parts of Europe also there was legislation against the dead hand. In the Two Sicilies, about 1238 Frederick II revived an old law prohibiting the alienation of land, by gift or sale, to clerics or clerical corporations. Land devised to such persons had to be sold within a year, under penalty of confiscation, to the heirs or to other laymen. In Venice gifts by will and other donations of land to the church were limited in 1329 to a term of ten years (changed in 1536 to two years), after which the land had to be sold. The application of this law in 1605 to the Venetian territories on the mainland was coupled with the provision that the consent of the council of Pregadi was necessary for every transfer to the church. By the Florentine code of 1415 the gift of land by will was permitted in Tuscany, but all other donations and all sales to the church were prohibited. Although renewed in 1457 the ecclesiastics rendered it ineffectual as they did the Concordat of 1515, which provided that all acquisitions by the church during the preceding fifty years were subject to public burdens.

In the northeastern parts of Germany, where the Saxon law prevailed, the heirs were allowed a period of thirty years and a day in which to reclaim property sold to the church; but in the southern and western regions, the territory of the great prince bishops, the *Schwabenspiegel* was in force and no restrictions were imposed on mortmain; indeed donations were stimulated, and at the beginning of the Reformation about one half of the land in Germany belonged to the church. In the sixteenth century temporal rulers, seeing the folly of this condition, passed laws against mortmain. Maximilian I in 1518 prohibited alienations to religious bodies without the permission of the ruler and diet; where alienations were made in contravention of this law the land could be purchased at a reasonable price by the nearest relative, the sovereign or any layman. Ferdinand I in 1564 renewed the latter provision, while in 1669 Leopold I declared that all such alienations should be void. In Flanders as early as 1293 the transfer of land to the church was prohibited, and in the fif-

teenth century in Brabant the vendor or his heirs had the right to redeem sales to the church. The evasion of these laws led to the issuing of an edict in 1515 whereby all gifts to the church by will or otherwise were declared invalid; all sales were subject to the consent of the prince and the magistrates of the provincial capital. Clerical opposition to the edict and its non-observance caused Charles V to issue a pragmatica in 1538, which stipulated that all parties to a transfer of land must declare on oath that they did not intend to place the land in the dead hand.

In pre-Reformation France and England the effect upon the feudal system of alienation into mortmain, an effect which extended all over Europe, may be studied with special advantage. From the twelfth century the feudal lords in France were seriously perturbed because church tenure had greatly diminished their dues, and they became more and more opposed to ecclesiastical holdings either as fiefs or *aumônes*. The *aumône* was a tenure resulting from the grant of a holding, free of all feudal obligations, to the church. The vassal was supposed to obtain the consent of his immediate suzerain to this grant, and when a fief was thus converted it was said to be amortized, or held in mortmain. The first attack upon mortmain, as found in the *Établissements de saint Louis* and in Beaumanoir, provided that if ecclesiastical corporations did not perform the services due from the fief, they had to sell the land within a year and a day; if not, the lord (suzerain) was entitled to take it. A second principle, embodied in the *Grand coutumier de Normandie*, held that an alienation in mortmain (*donation en franche aumône*) prejudiced only the donor or the lord who gave his consent and that the rights of all the other feudal lords were preserved in respect to it; therefore a forfeiture on the part of the vassal who had alienated in mortmain enabled the overlord to retake the land. Before there could be a true and effective amortization of land, the consent of all overlords, including barons as lords paramount, had to be obtained; for the barons' claim that the right to amortize was baronial was generally recognized in the thirteenth century. Toward the close of that century the king began to assert the right to amortize lands as his prerogative and a century later the royal monopoly of *amortissement* was definitely established.

Meanwhile churches, abbeys and other *gens de mainmorte* adopted methods for acquiring land in the face of the growing hostility of the

feudal lords. In some parts of France the ecclesiastical corporations obtained the right, with the acquiescence of the lords, to designate some man (*un homme vivant, mourant, et confisquant*) to represent the corporation from the point of view of the preservation of feudal rights; hence, upon the commission of delicts by this man or upon his death, the lord could enforce the rights incident to feudal tenure. A more usual method was that whereby the churches and abbeys bought for cash the consent of the overlords to amortization. Once this usage was established the ecclesiastical corporations could keep the fiefs or the *censives*; the payment to the overlords acquired the character of a *taxe de mainmorte*, and amortization became a matter of finance. The *taxe de mainmorte* was at first the subject matter of sharp bargaining, and it had to be paid not only to the immediate suzerain but to all the overlords. Since the tax was not fixed the lords were in general very exacting in their demands. Frequently churches were constrained to pay more than the value of the lands themselves. In order to relieve them there was enacted in 1275 the celebrated ordinance which not only regulated the position in respect of the tax payable for lands already acquired by the church within the king's lands but also served as the basis of all later French ordinances concerning *amortissement* and the scale of *taxes de mainmorte*, which, after the right to amortize had become regal, were extended to the whole realm. During the fourteenth century the fiscal interest predominated and the tax increased, sometimes amounting to spoliation. Under Philip the Fair and his sons there was a certain degree of moderation, but by the reign of Charles VI (1380-1422) the taxes were prohibitive, forcing churches and other *gens de mainmorte* to sell their lands. Introduced in the interests of the church, the legislative *taxe de mainmorte* finally became an instrument directed against it. The heaviness of the tax resulted in frequent evasions, and from the fourteenth to the eighteenth century there were occasional inquests throughout the kingdom designed to follow up alienations and collect the king's tax. During that period both religious houses and mortmain holdings increased, and therefore Louis XIV revived old laws which required special royal licenses for the establishment of new religious houses and made the granting of a license a difficult and formal matter. But even Louis' legislation was not enforced, and in 1749 Chancellor Daguesseau renewed, strengthened and extended

it: many houses which had been founded without royal license, in 1636 or later, were suppressed; special royal letters were required for each separate acquisition of land by a religious corporation and these were to be issued only upon clear proof of the necessity or utility of each transaction. Legacies of land to the church had no validity.

Conditions in England differed from those on the continent by reason of the commanding position of the king and also because all land in the kingdom was brought within the scheme of feudal tenure. Since the king was feudal overlord he, not less than all the other feudal lords, had a direct interest in ecclesiastical encroachments upon feudal rights. At English common law the power to acquire and hold land was incident to a corporation. The numerous alienations into mortmain in the Norman and Angevin periods were therefore fully legal. They were, however, alienations *inter vivos*, for there was no power to devise lands by will until the Statute of Wills (1540) and when the power was granted corporations were expressly excluded from its benefits. The vast increase in the estates of ecclesiastical corporations during the twelfth and thirteenth centuries constituted a danger to secular interests, for the church was not only impairing feudal dues but was also asserting and establishing the doctrine that its courts, and not the king's or feudal courts, should decide all litigation concerning land which had been given to God and the saints by way of alms. The first enactment against alienation into mortmain was contained in the reissue of Magna Carta by Henry III (1217), which provided in effect that gifts of the fee simple to ecclesiastical "corporations aggregate" (a corporation composed of a number of persons) should be a cause of forfeiture to the lord of the fee. Ecclesiastics attempted to evade this enactment by taking long leases. Such evasion, together with the fact that the prohibition did not apply to acquisitions of land by ecclesiastical "corporations sole" (an office occupied by one person at a time, such as that of a bishop), led to Edward I's statute *De viris religiosis* of 1279. This statute, which marked a decided victory for the lay elements of society, put a stop to all gifts, leases or sales of land to ecclesiastical corporations without the license of the alienor's lord. In fact the rule became established that a license must be obtained from all the other mesne lords. Without this license, the immediate lord of the fee or, if he defaulted within a year, the other lords para-

mount could seize the land. If all the others failed to take advantage of their rights, the king himself might take the land by way of forfeiture. Grants without license were good until defeated by such an entry. Lawyers in the time of Henry VI, Edward IV and Henry VIII thought that if a lease were made to a religious house for a hundred years or more it might be held void as infringing the policy of the mortmain laws. The provisions of the statute *De viris religiosis* were extended to lay corporate bodies by a statute of Richard II (15 Rich. II, c. 5).

Edward I's statute of 1279 was a part of his land legislation, which was intended both to encourage freedom of alienation and to preserve for the feudal lands the valuable incidents of tenure. One result was the gradual decay of tenure in frankalmoign, or free alms—an alodial type of tenure by which many ecclesiastical corporations held their lands, and which they maintained should stand outside the secular system of law and be under the jurisdiction of the ecclesiastical courts. Indirectly its decay was a blow to mortmain, for religious persons and bodies were brought more and more into the scheme of tenures devised primarily for lay persons.

The ecclesiastics sought to evade the statute *De viris religiosis* through the "common recovery," a form of conveyance which is said to have originated for the express purpose of vesting lands in the dead hand. The device consisted in the bringing of a fictitious action by an ecclesiastical corporation against the tenant in possession for the recovery of the land in question. The ecclesiastical corporation set up a fictitious title to the land; the tenant, acting in collusion, made no defense and hence judgment was given for the corporation. Accordingly, since the statutes of mortmain did not apply to actions, the religious corporation obtained a good title. By the Statute of Westminster II in 1285, however, common recoveries as a mode of effecting alienation in mortmain were stopped.

The next expedient of the church was the use (*usus*) by which lands were conveyed to feoffees for the use of religious houses or other ecclesiastical corporations. Since lay persons held the legal title, the law could raise no objection although the use gave all the practical benefits of ownership to the ecclesiastical corporation and had the effect of limiting freedom of alienation. In 1391, however, uses of land were declared subject to the Statute of Mortmain (15 Rich. II, c. 5).

The history of mortmain in the municipal communities in the Middle Ages represents an important aspect of the fiscal effect of mortmain. Town authorities early perceived that the exemption of ecclesiastical lands from taxation necessitated local laws which would check the flow of gifts to ecclesiastical persons. A town law of mortmain soon developed in all parts of Europe; in some countries, as in England, it preceded national or state legislation. From the thirteenth century there were many municipal ordinances on the continent which forbade all alienations of land or houses to the church. In some towns the laws prohibited donations of movables beyond a certain amount; elsewhere land acquired by the church had to be alienated within a year or, if it remained in ecclesiastical hands, was subjected to municipal law and taxes; while in still other towns a heavy tax was imposed upon property which passed from the burgesses to the clergy.

Many historical factors in the growth of Europe during the fourteenth and fifteenth centuries were leading either directly or indirectly to the transformation from mediaeval to modern conditions. The growth of monarchical temporal power had been accompanied by marked tendencies in political thought favoring the exaltation of the state at the expense of the church; the policy of the secularization of ecclesiastical property, which had been taught by Wycliffe and others, was an integral part of this body of doctrine. The rise of nationalism, accompanied by the establishment and expansion of colonial empires by the monarchical states of Europe in early modern times, only intensified the general trend. Moreover the needs of secular society in agriculture, industry and commerce had increasingly demanded that at least a large part of the vast and multiplying landed wealth of the church should be taken by the state for distribution among the lay classes of society. The need of bringing ecclesiastical property into commercial use was a most powerful incentive. The opposition to the dead hand was aggravated by the non-observance and evasion of the laws of mortmain, action which had resulted in increased ecclesiastical endowments. In addition many held that only by impoverishment could the church be brought to a more perfect fulfillment of its spiritual and moral role.

In a broad sense the changes wrought during the sixteenth century meant the rise of secular interests and their dominance over the ecclesiastical. In this period there emerged the main

features of modern policy in respect to ecclesiastical property. An integral part of this policy was the secularization of church lands. Nor was the seizure of property held by the dead hand restricted to Protestant states, for Catholic statesmen became convinced that the accumulation of ecclesiastical wealth was inimical to the interests of the body politic and that the secular authorities were therefore entitled to appropriate it. The history of mortmain and of secularization from the time of the Reformation is an aspect of the failure of the Roman Catholic church to maintain its former hold on the religious and secular life of western society. Secularization on some occasions had been applied, however, long before the Reformation set in. The forced leases of church lands to the laity, known as *beneficia* or *precaria*, were in fact a form of secularization.

In north Germany, where the princes broke away from the Roman Catholic church during the Reformation, the spoliation and secularization of ecclesiastical property, often accompanied by violence, took a progressive course. In the Scandinavian north, where Lutheranism had intrenched itself, the process was similar. In Sweden Gustavus Vasa carried through in 1527 measures by which all episcopal, capitular and monastic property which was not absolutely required by the church—and of this the king was the sole judge—was to be handed over to the crown. All tax exempt lands which the church had acquired by gift since 1454 were to revert to the original owners and all taxable land was to be surrendered. Under this legislation the monasteries were deprived of most of their property and many ceased to exist, while the bishops also lost many of their holdings.

The secularization of church property in England began in the later Middle Ages. Edward II dissolved twenty-three preceptories of the Templars. In many ways the wealth of the church was confiscated and used for educational purposes; and officials and courtiers were given pensions from monastic estates. At length came Henry VIII's Reformation Parliament of 1529, one of the acts of which had as its main purpose the promotion of the transfer of ecclesiastical property to laymen and which included a provision that although an abbey might lawfully own estates, it could not lease its farms to spiritual persons. The parliamentary acts dissolving the monasteries formed a part of Henry VIII's church settlement. By the act of 1536 the lesser monasteries were dissolved; the greater monasteries suffered the same fate through the

statute of 1539. Nearly four hundred smaller houses, about two hundred greater houses and two hundred friaries together with their land and chattels were acquired by the king. From them the king endowed a new nobility tied by self-interest to the crown's ecclesiastical policy.

In Ireland the English Reformation statutes were rapidly copied. A general dissolution followed the suppression of certain monasteries in 1537; and the largest part of the land was conveyed, as in England, to private persons and often at nominal prices. In Scotland also church property was secularized.

In the Catholic states even during the Reformation some of the princes were as eager as the Lutherans to seize the property of the religious orders. At Augsburg in 1524 both Catholics and Protestants proposed to secularize all the property of the Catholic church in Germany: out of the revenues ecclesiastics were to be supported during their lifetime, but the remainder of the income was to be used for public purposes, including the support of a standing army. This project failed, however, as did several similar ones later on; and the process of accumulating property in the dead hand within the Catholic regions continued. But the idea of the secularization of church property was gaining ground; the first attack was upon the property of the Society of Jesus, which engaged in widespread trade activities and held extensive colonial possessions free from taxation. In succession Portugal in the year 1759, France in 1764 and Spain in 1767 expelled the society and confiscated its property. While in some cases the funds were used for ecclesiastical purposes, in others the property was incorporated in that of the state.

In France the Pragmatic Sanction of 1438 had been displaced in 1516 by the Concordat of Leo X and Francis I, which remained a state law until the French Revolution. By obtaining through the concordat the right to nominate the holders of the high ecclesiastical offices the king was enabled to dispose of the great fortune of the Gallican church to reward his followers. Since benefices could be held *in commendam*, the transformation of the revenues of the church property into the king's civil list was complete. All actions involving church property were brought in the temporal courts and not in the ecclesiastical, and church property became subject to taxation. Thus, while in Germany and England the desire to obtain such property motivated temporal rulers during the Reformation,

in France the policy of secularization ceased to be an operative force after the Concordat of 1516, which had itself given to the state practically all that it desired or needed.

With the French Revolution the process of confiscation of property held by the dead hand entered upon a new and important phase of its history. Although the church was under the control of the state in France, together with the nobility it occupied a privileged position. Above all else the French in 1789 demanded the abolition of the fiscal privileges of these two groups. While the bourgeoisie were fighting to obtain the sole control of power, they united with the peasants against the privileged orders; and in general freedom and the enfranchisement of land were the aim of the rural classes. In 1789 the National Assembly declared that all ecclesiastical property was at the disposition of the nation and that the clergy were to be supported by salaries; this act was followed by various decrees in 1790, including one by which the religious orders were suppressed and their temporalities absorbed. The lands were sold; and while many peasants obtained small holdings, most of them went to the urban and provincial bourgeoisie.

This attack upon the dead hand was one of the dramatic and far reaching effects of the French Revolution. Revolutionary legislation favored individualism and it was hostile not only to corporate bodies, which it dissolved, but also to endowments, which it abolished. The revolutionists destroyed both "political feudalism" and "corporate feudalism" and established the principle of free alienation. The church suffered from the revolutionary maxim that "the land may not belong to the dead but to the living."

The action of the French revolutionists hastened the process of secularization throughout Europe. In 1803 in the face of Pius VII's indignant protest a German imperial law, supported by Catholic and Protestant statesmen alike, secularized not only nineteen bishoprics, including the religious houses, but also the four princely archbishoprics of Mayence, Trèves, Cologne and Salzburg. This huge seizure meant a loss to the church of territories containing over three million persons and of a revenue of 21,000,000 florins; all this property was to be disposed of by secular rulers for secular as well as for religious purposes.

In Italy it was only after the unification that the secular elements were strong enough to act

effectively. By the laws of 1866 and 1867 the religious houses were abolished and their property secularized; and the enforcement of the law proceeded rapidly. Following the occupation of Rome in 1870, a law of 1873 disposed of the property of the houses suppressed there.

In Portugal in 1833 the convents and the military orders were suppressed and their property confiscated. The process of secularizing church property in Spain, which began in 1808 during the Napoleonic occupation, has been more prolonged and is not yet ended. During this whole period the movement has run parallel with developments in Spanish political history. Secularization carried out by one government has been undone or partly undone by another; and the later victory of anticlerical political elements has restored and carried even further the secularization begun at an earlier time. The measures of 1808-12 were destroyed by the reaction of 1814 but were restored and extended following the revolution of 1820, while in 1823 the purchasers of secularized property were unceremoniously evicted without compensation. Secularization has been the subject matter of concordats between the Holy See and the Spanish state. The general result of the Spanish process is that much ecclesiastical property has been secularized and part of it sold. The republic established in 1931 promises the final secularization of ecclesiastical holdings.

The expansion of Europe in the age of discovery and colonization carried the problems of mortmain to the New World, especially in regions colonized by the Catholic states. In mediæval times the secular authorities in Spain had been opposed to the unlimited acquisition of property by the church; and this became in the sixteenth century the colonial policy of the Spanish government. In 1535 the sale of land to the clergy and churches was forbidden and made subject to forfeiture; this law was included in the *Recopilación de leyes de los reynos de las Indias*, compiled in 1680. The acquisition of land by the religious orders was disallowed in 1570, and from the seventeenth century to the nineteenth there were decrees prohibiting bequests to the church by dying Indian converts. By frequent renewals of legal prohibitions and by other means the government sought to enforce the principle that no real property could legally be held by churches or convents but nevertheless the church continually increased its holdings; and it is estimated that before the revolution of 1810-21 it controlled at least 50

percent of the land in Mexico. Independent Mexico took no action against mortmain until 1856, when a decree was issued secularizing all church property. During a period of civil war in 1859 Juárez continued this policy. Since much land had been secularized under these laws at the time of the French intervention in 1863, the provisional government found it necessary to recognize as valid the title of the purchasers. By the constitution of 1857 religious institutions were forbidden to hold real estate, except for direct purposes of the institution, or to hold mortgages; and the establishment of religious orders was forbidden. By the constitution of 1917 Mexico now prohibits the ownership by the church even of places of worship.

From colonial days Roman Catholicism has been the prevailing religion of Central and South America. Nevertheless, the general tendency in most of the republics has been to follow the policy pursued by Mexico. The temporal authorities have struggled to prevent the further accumulation of property by the church and have ultimately carried out measures of secularization. In some republics, such as Mexico, Guatemala and Honduras, this process has been accompanied by an absolute separation of church and state. In Ecuador and Colombia the Roman Catholic church is stronger, but even in Ecuador ecclesiastical property has been secularized.

In the Philippines from the Spanish conquest and settlement of the islands in the sixteenth century down to their acquisition by the United States an outstanding feature was the control exercised by the friars. Under this regime the religious orders had acquired vast tracts of land despite repeated prohibitions by the Spanish crown. After the cession of the islands by Spain to the United States in 1898 there came a change. By the act of Congress of 1902 which established the civil government of the islands, the purchase of lands belonging to the friars was authorized; and after negotiations with the Vatican the friars' lands were bought for \$7,000,000.

Questions in regard to the acquisition and holding of property by the Roman Catholic church are settled in some modern states by concordats, or treaties with the Holy See. Although a law of mortmain is not a characteristic feature of all modern legal systems it is still important in many states, for there is in general a widespread policy either of preventing the acquisition of immovable property by corporations, whether ecclesiastical or lay, or at least of making such acquisitions subject to the con-

trol of the supreme authority of the state. The chief objects are to keep property in commercial use and to prevent the growth of any power which might threaten the state. In some systems a distinction is drawn, with respect to the holding of land, between business corporations and corporations formed for religious, charitable or similar objects which have no intention of making profits. Some strictly limit the amount of land which can be held by churches; and in certain states the law has distinguished between domestic and foreign corporations. In France the law regulates the acquisition of property by corporations, both lay and ecclesiastical, and taxes their holdings. In Prussia, Baden and Hesse the acquisition of property by any corporation, if it be over a fixed value, requires the consent of the state authorities. There are German states in which the acquisition of personal property by religious bodies is not restricted, while in others gifts and bequests of personal property are limited. Prussia and other German states punish infringements of the mortmain laws (*Amortisationsgesetze*) and make the transactions null and void. A few German states have no mortmain laws, but where they exist they generally apply equally to the Roman Catholic church and the evangelical churches.

Mortmain in England is now governed by the Mortmain and Charitable Uses Act of 1888, which provides that every conveyance of land to a corporation, lay or ecclesiastical, requires either the authority of a statute or a license of the crown, without which it is forfeitable. Its operation is limited, however, since there are many English statutes which grant the requisite authority to corporations, both lay and ecclesiastical. In the great majority of cases there is no need for a license; for example, by the Companies Act of 1929, trading companies incorporated under it have power to hold lands notwithstanding the restrictions contained in the act of 1888. The mortmain restrictions have been expressly removed in respect of conveyances by deed or will to certain classes of corporations, such as the universities and colleges of Oxford and Cambridge.

As in some other countries, the laws of mortmain and of charities in England are both historically and in present day practise separate and distinct parts of the legal system. Whereas the mortmain acts regulate conveyances of property to corporations, the charitable uses acts govern assurances of property to charities. The Mortmain and Charitable Uses Act dealing

with both corporations and charities nevertheless treats them separately. The point at which the two branches of the law meet is where a charitable institution is itself a corporation holding property in its corporate capacity. In general the law has been more favorable to conveyances to charities than to corporations. Under the governing Mortmain and Charitable Uses acts (1888, 1891) land may be given by will for any charitable use or purpose but within one year from the testator's death it must be sold, unless the High Court or the charity commissioners hold that it is required not as an investment but for actual occupation by the charity. In part the act of 1888 repeats and modifies some of the provisions of the Charitable Uses Act which became effective in 1736; namely, that if a benefactor intends that a charity shall actually keep the land itself rather than its value, he must make a grant of it twelve months before his death. If such grant is not a gift but takes the form of a "sale for valuable consideration," it need not be made a year before the grantor's death. In the case of a gift in mortmain neglect of the requirements of the law may result in the forfeiture of the land, whereas similar neglect in the case of a charitable gift makes it void.

In Canada in the province of Quebec the law of mortmain was based upon French law and was regulated chiefly by a royal edict of 1743, entitled *Déclaration du roi concernant les ordres religieux et gens de main-morte établis aux colonies françaises*, by which corporations, whether ecclesiastical or civil, were prohibited from acquiring or holding any immovable property unless by the express permission of the crown, "except for certain purposes only and to a fixed amount and value"; and this general principle appears to be the law in Quebec today. The general English law, including the so-called mortmain act of 1736 and the cases decided under it, was adopted in Upper Canada (later Ontario) in 1792. In Alberta, British Columbia, Victoria and Saskatchewan local registration of extraprovincial commercial companies is required; but when thus registered they are permitted to hold land. In Nova Scotia foreign companies are specially empowered to hold land. There are no mortmain laws in Scotland or South Africa.

In colonial days as well as in the period since independence mortmain has played a comparatively slight role in the United States of America because of the facts that a feudal system never

developed and that the church did not acquire much power. The English statutes of mortmain were not reenacted or considered in force except in the state of Pennsylvania, where they are judicially recognized. In Pennsylvania grants of land to a corporation are prohibited without a license from the commonwealth, a principle based upon both English statutes and local statutory law. In Maryland a devise to a religious corporation must have legislative sanction, while in Mississippi devises for religious purposes are void by statute. Certain other states have "mortmain acts" restricting the right of religious corporations to hold land or limiting the power to make conveyances, devises or bequests to religious societies or charities. The act of 1862 strictly limited the amount of property which religious societies could hold in United States territories. These mortmain acts are based upon the same general policy as that of the English statutes of mortmain. They avoid the deed or will either altogether or when it is made within a specified time before the death of the grantor or testator or when the conveyance is made without valuable consideration or when the land conveyed is above a specified value; and they do not always draw a clear distinction between corporations and charities. The rights of corporations in general to acquire or hold land depend upon statutes and upon their charters. Certain states limit or forbid the acquisition of property by private corporations.

MOSER, JOHANN JAKOB (1701-85) and FRIEDRICH KARL VON (1723-98). Johann Jakob Moser may be called the founder of the positivistic treatment of public law in Germany. With prodigious labor he brought together the elements composing the law of the old empire, which Pütter later used to create his system. In his rationalism Moser was a modern jurist: the Middle Ages and their conception of the state appeared to him dark and fantastic. His life's work was devoted to the study of facts and sources.

Moser was fitted for this work not only by an almost incredible capacity for labor but also by extensive political practise. He worked in the imperial court as well as in the imperial chamber of justice and the imperial council and acted as adviser to numerous spiritual and temporal princes and cities.

In the positivistic direction of the exact description of existing law Moser treated both public and international law and unquestionably improved their contemporary condition. He has been called indeed the father of German public law, and in the history of international law his name ranks with the great positivists. Averse as

he was to all antiquarianism which has no internal relation to speculative thought, he regarded international law not as a system of norms valid in themselves but as a system of customary practises, the principles of which he repeatedly described. In general his conception of the nature of juristic activity made it necessary for him constantly to devote himself in innumerable publications to the newest manifestations of political practise.

Thanks to his character and to his religious outlook Moser escaped the danger of a utilitarian position, which usually accompanies preoccupation with factual data. For him concentration on the actual is the expression of a simple love of truth; and neither the chicane of censorship nor a five-year imprisonment in the Hohen- twiel, to which he was sentenced by the duke of Württemberg on account of his support of the estates-constitution of that duchy, was able to shake his convictions. In these difficulties he derived inner solace from his religious convictions. The mode of life of the righteous man and the Christian may be traced in Moser's autobiography, which is as superior to Pütter's autobiography in inner truth and genuine warmth as are the latter's public law writings to Moser's in elegance and clarity of composition.

While Moser can scarcely be spoken of as a political figure in the true sense of the term—within the limits of his juristic convictions he was a loyal subject of authority—his intervention on the side of justice and his sufferings in the Hohentwiel have caused him to be regarded as a national martyr. Seen thus he appears as a great patriot, a liberal citizen and the inflexible champion of threatened liberties.

In contrast with Moser's political position, which although essentially passive was extremely influential, his son Friedrich Karl, under the influence of a changing era, embraced an active policy of resistance, which proclaimed the death of the absolutistic era. As a jurist Friedrich Karl von Moser was essentially a pupil of his father, whose methods of collecting and digesting material he adopted and extended. He surpassed him, however, in his political writings, in which he described with great frankness the wrongs of the existing state; he fearlessly attacked the despotism and the accompanying wastefulness and sycophancy of the many German principalities and demonstrated the responsibility of the prince and his councilors. Moser also exerted practical efforts in behalf of his ideas, vehemently insisting on the relief of the finances

of Hesse-Darmstadt. But to insist upon a good administration as a public legal duty of the ruler was at that time so unheard of that his opinions made little impression on the reigning bureaucracy. In recalling also the old imperial patriotism he was one of the first to stir the German national spirit, although this appeal too could not be immediately effective. The French Revolution, which Moser lived to see, did not make him a democrat but it increased the authority of his writings.

MÖSER, JUSTUS (1720-94), German man of letters and historian, one of the fathers of the historical school of law, economics and ethnology. Möser's entire life was spent at Osnabrück, the capital of the principality of the same name. His father had been one of its high officials, and

he himself served it in the same capacity. Constant study of contemporary English and French literature, a long stay in London immediately after the Seven Years' War and his careful observation there of country and people were deciding factors in his mental development.

Early complimentary verses, moralizing articles, the tragedy *Arminius* and discussions upon Voltaire and Rousseau suggest the educated man of letters of the period of Enlightenment rather than the historian he was to become. It was only after the war that he began his *Osnabrückische Geschichte* (3 vols., Osnabrück 1768-1824; vols. i-ii 3rd ed. Berlin 1819). The introduction to this unfinished history created a quite understandable sensation. Möser demanded that history should no longer be "divided into periods corresponding with the different rulers" but that it should be a real history of the people. He was still influenced by the doctrine of the social contract, but since his models were the peasants of the principality, who lived according to their hereditary customs, a view of the past in terms of men, soil and freedom took ever deeper root in his mind. He envisaged constitutional history as dealing not with princely liberties but with the rights and duties of the people. The introduction was reprinted in 1773 as "Entwurf einer deutschen Geschichte" together with equally sensational essays by Herder and the young Goethe in the famous volume *Von deutscher Art und Kunst*. From that time Möser was constantly in touch with Goethe, who credited the "Patriarch of Osnabrück" with great influence on his youthful development and who appraised Möser's second work in immortal terms. This was his *Patriotische Phantasien* (4 vols., Berlin 1774-86; new ed. by R. Zöllner, 2 vols., Leipzig 1871), originally published as weekly articles in the *Osnabrückische Intelligenzblätter*. All these essays dealt with the customs and rights of his countrymen and at the same time embraced the vital questions of contemporary administration and economics. Here Möser broke away from the rationalism of his time in order to concentrate attention upon organic development rather than the definition of institutional ideas. He opposed the "present propensity toward general laws and decrees" and tried to show that all existing conditions are sacred and reasonable when viewed in the light of their historical origins, thus paving the way for Savigny and Grimm. It was he who discovered in history the intuition of reality in its prolixity and in its simplicity, in its infinite coherence and

in its mutability. The demand for research based on primary sources results from this view, as does also the abandonment of moralizing contemplation and superior judgment of the past in favor of a humble understanding of it. At the same time Möser advocates the education of the public to an understanding of customs, rights and economic relations.

He did not, however, desert literature, for his last work was *Ueber die deutsche Sprache und Literatur* (Osnabrück 1781), his magnificent answer to Frederick II's critique of German literature. Characteristic of his method was the search for the real, the primordial, the historically evolved, in contrast with convention and the abstract definition in customs, law and art.

K. BRANDI

Works: *Sämmtliche Werke*, ed. by B. R. Abeken and J. W. von Voigt, 10 vols. (2nd ed. Berlin 1858); *Gesellschaft und Staat*, a selection with bibliography, ed. by Karl Brandi (Munich 1921).

Einleitende Bemerkungen" in *Preussische Akademie der Wissenschaften, Philosophisch-historische Klasse, Sitzungsberichte* (Berlin 1932) p. 2-14; Brandi, Karl, in *Preussische Jahrbücher*, vol. ccxxvii (1932) 54-69; Zimmermann, Heinz, *Staat, Recht und Wirtschaft bei Justus Möser*, List Studien, no. 5 (Jena 1933).

MOSHEIM, JOHANN LORENZ (1694-1755), founder of modern Protestant ecclesiastical historiography in Germany. Mosheim studied at Kiel and became professor of theology at the University of Helmstedt and after 1747 at the University of Göttingen. He was not only the most important theologian of his time but also a humanistic scholar of European reputation. In 1732 he was elected president of the Deutsche Gesellschaft in Leipzig and he took a leading part in the founding of the Göttingen Gelehrten-Gesellschaft—whence the slogan, *Ubi Moshemius, ibi academia*. He placed his rich knowledge and ability primarily at the service of ecclesiastical history, which he elevated from the status of an auxiliary to polemics and apologetics to the position of an independent branch of theological science. Mosheim employed the scientific source methods of the new historical scholarship in solving the problems of ecclesiastical history. His comprehensive knowledge of languages enabled him to make use of the results of the work of foreign scholars, especially English and French. In his many works he treated special questions and presented the general history of the church in its major interrelations. In doing so he drew into his orbit events which

had hitherto remained entirely unnoticed in ecclesiastical history, as in his *Historia Tartarorum ecclesiastica* (Helmstedt 1741; tr. into English, London 1750) and in his *Ersählung der neuesten chinesischen Kirchengeschichte* (Rostock 1748). In his *Versuch einer unpartheiischen und gründlichen Ketzergeschichte* (Helmstedt 1746), continued by *Anderweitiger Versuch . . .* (Helmstedt 1748), and in his *Neue Nachrichten von dem berühmten spanischen Arzt Michael Serveto* (Helmstedt 1750) his liberal, conciliatory theological standpoint is evident. In his *Institutiones historiae ecclesiasticae Novi Testamenti* (Helmstedt 1726, finally revised as *Institutiones historiae christianae antiquae et recentioris libri quatuor*, 1755; tr. by J. Murdoch, 3 vols., 5th ed. New York 1854) and in his *De rebus Christianorum ante Constantinum Magnum commentarii* (Helmstedt 1753; tr. by R. S. Vidal, 3 vols., London 1813-35) he organized the material according to the "external" and "internal" condition of the church. It was thus natural that he devoted special attention to social questions. He endeavored to demonstrate, for example, the influence of the church on the moral conditions in the Roman state.

MOSHESH (1783-1870), South African native statesman. In the early nineteenth century Basutoland and the neighboring districts of South Africa were in utter confusion because of the devastation wrought by the military campaigns of the Zulu chief Chaka (1784?-1828), who with his well equipped, disciplined force had conquered the region, partly exterminated its inhabitants and established a Zulu nation of the remnants of more than one hundred tribes. Moshesh, originally the chief of an insignificant clan, succeeded by diplomatic skill, fine generalship and peaceful persuasion in attracting to himself and assimilating into a composite whole the scattered remnants of numerous broken tribes. He resisted the attacks of other native chiefs, and with the growth of his prestige people flocked to his rule until he was the most powerful chief in that part of the country. He ruled

with vigor but moderation over the nation he created, welcomed the missionaries and encouraged their activities, although he himself did not adopt Christianity, and promoted the spread of education. From 1838 onward he became involved in several wars with the Boers of the adjacent Orange Free State, with the result that he lost much valuable territory. In 1868 the British intervened and annexed Basutoland. It is due to the influence of Moshesh that of the several native states which arose in south Africa during the last century Basutoland is the only one which has survived the impact of civilization.

I. SCHIAPERA

Consult: Ellenberger, D. F., *History of the Basuto* (London 1912); Lagden, G. Y., *The Basutos* (London 1909).

MOST, JOHANN (1846-1906), German-American anarchist. Most first came in contact with the labor movement during his travels as a journeyman bookbinder in Switzerland and Austria. In Vienna he was sentenced to five years' imprisonment for revolutionary activity but was released after twelve months on condition that he leave Austria. He returned to Germany, devoted himself to socialist editorial work and in 1874 became a member of the Reichstag. Under the Bismarck antisocialist laws he was exiled from Berlin and emigrated to London, where on January 3, 1879, he founded his famous weekly, the *Freiheit*. Most, who had become dissatisfied with Social Democracy for its overemphasis of parliamentary work and its neglect of revolutionary education, hoped that the *Freiheit* would serve the German movement as its illegal organ, but the party leaders feared his radicalism and expelled him from the party. His activity in London was short lived; after two prison terms and an unsuccessful attempt to publish his paper in Zurich he left for the United States in 1882.

In New York Most resumed publication of the *Freiheit*, which labored under constant financial difficulties. Despite bitter controversies with various anarchist leaders, with whose tactics he disagreed, he succeeded in organizing a collectivist, or communist anarchist, group which played a dominant part in the movement. He disapproved of Berkman's attack on Frick during the Homestead strike in 1892, declaring that assassinations were justifiable only where they awakened a response among the workers. Most attempted to impart a concrete and practical

labor slant to anarchism; under his leadership the American anarchists actively supported the eight-hour movement and all forms of militant labor union struggle. His efforts to indoctrinate the labor movement with anarchism were, however, unsuccessful. He served two terms on Blackwell's Island. Besides his editorial and propaganda work Most was the author of a large number of pamphlets which are still widely read in the labor movement. The *Freiheit* survived only a few years after his death.

MOTHERS' PENSIONS. The terms mothers' pensions, widows' pensions, mothers' aid and mothers' allowances have been used to designate public aid extended to children in their own homes. Such aid is aimed to prevent destitution and the break up of the family and commitment of dependent children to institutions. It has taken two forms: non-contributory grants from public funds and national contributory insurance against death or disability of the father. Both forms had their inception at almost the same time, with the introduction of allowances in the United States in 1911 and in New Zealand in 1912 and with the introduction of contributory insurance in Germany in 1911. It was the non-contributory system of aid which developed more rapidly, especially in the United States, because of the absence of schemes of social insurance with which the insurance for dependent mothers and children was linked. This system is not a pension but rather a special form of assistance to families of a selected type; it is based upon established need for assistance and is on a higher plane than outdoor relief as to character of beneficiaries, administration and amounts of aid granted. The non-contributory

system is not only to be found at present in the United States but has existed in Canada since 1916, in Denmark since 1914, in New Zealand since 1912, in New South Wales since 1926 and in certain cities of Norway. National contributory insurance has obtained in Germany since 1911, in Italy since 1919, in Belgium since 1924, in Great Britain since 1925, in France since 1930 and in less definite form in a number of other countries. Great Britain also provides a form of non-contributory grant for a specified group of widows and orphans not covered under the insurance act.

In the United States the movement took definite form after the White House Conference on the Care of Dependent Children held in 1909. Prior to the first legislation in 1911 a number of states and localities had recognized the wisdom of providing care for dependent children in their own homes and had made possible such care in a limited way through county funds granted by juvenile courts or through school funds which enabled children of indigent parents to attend school. The first definite legal provision, passed by the Missouri legislature in 1911 and applying at first only to Jackson county, in which Kansas City is located, called for the "partial support of poor women, whose husbands are dead or convicts, when such women are mothers of children under the age of fourteen years." In the same year the first state wide law was enacted in Illinois; this provided for county funds to be paid on the order of the juvenile court to parents who were unable to care for their children but who were otherwise proper guardians.

In the period between 1911 and 1914 a nation wide campaign was carried on by women's organizations and social welfare agencies. In 1912 Colorado and in 1913 seventeen other states enacted mothers' pension or mothers' aid laws. In 1915 eight states enacted laws for the first time and during the next five years fourteen states adopted the principle of mothers' aid. Laws were passed in other states in 1923, 1926, 1928 and 1931. By 1933 mothers' aid laws were found on the statute books of forty-six states, the District of Columbia and the territories of Alaska and Hawaii. Only the states of Georgia and South Carolina are without such provision. The experimental character of the early legislation, a result of the haste with which the idea was adopted, is evidenced in the numerous later revisions and the necessity of further changes to improve the administration, to make the ap-

plication more inclusive and to increase the funds available for grants.

While in the earlier laws aid was provided only for children of widows, at the present time all but four states permit aid to be granted to any mother with dependent children or specify a wide range of causes of dependency, including death of father, desertion, divorce, physical or mental incapacity and imprisonment, with necessary restrictions pertaining to desertion and divorce cases. Four states specifically include unmarried mothers, while in some other states the law may be so applied. A few states give assistance to relatives or guardians, other than parents, having custody of a dependent child. In six states aid may be granted to an expectant mother.

The most important consideration with regard to the age up to which a child may be granted aid is that it shall be in conformity with compulsory school attendance and child labor laws. In only eight states in 1932 was aid limited to fourteen years. In four states aid may be granted up to fifteen years; in thirty and the District of Columbia up to sixteen years; in two up to seventeen years and in two up to eighteen years. In a number of states aid may be continued when a child beyond the usual age limit is incapacitated. In actual application, however, aid is frequently limited to fourteen years because of inadequate funds.

The eligibility requirements as to residence and citizenship vary in the different states from a minimum of one year in the county to citizenship in the United States together with five years' residence in the state and three years in the county. Most states do not require citizenship or declaration of intention to become a citizen of the United States.

Conditions determining the granting of aid refer mainly to economic need and to the mother's ability to give the child proper care. While in the majority of the states no specific mention is made of ownership of real estate and other property, a number of laws set up definite restrictions. Various state laws include a statement relating to investigation of each application in order to determine eligibility, the character of the home and the amount of aid required. In order to adjust the allowances to changing conditions it has been found desirable to provide for review of the grants at regular intervals, in most instances once in six months.

Experience in the administration of mothers' aid laws has shown the desirability of avoiding

strict limitation of allowance and of permitting assistance to be based upon the needs of each individual family. The laws of ten states and the District of Columbia do not place a limit on the grant per child or per family and either provide definitely or imply that the budget method shall be used to ascertain needs. Grants are still limited by law in most states; but in practice many of them grant aid in accordance with individual needs and resources of each family, so far as the limitations of the law and available appropriations permit.

The increasing application of the principle of home care for dependent children is shown in the figures available for three periods. In 1922 the number of children throughout the United States who were beneficiaries of mothers' aid was estimated as approximately 121,000, in 1927 as 200,000 and on the basis of figures obtained in 1930 as approximately 256,000. The annual expenditure for aid to children in their own homes was estimated for 1930 as at least \$36,000,000. Because of the lack of funds and the overshadowing need for general emergency relief it is probable that there has been a reduction in the number receiving aid and the amounts of allowances in 1931 and 1932.

Since the problems involved in administration are those of family relief and because public poor relief was in bad repute, administration was in most states lodged in a child welfare agency. The fact that in the middle western and western sections of the country juvenile courts have jurisdiction over dependent children and that in most localities in these states there existed no other county child welfare agencies explains in large measure the selection of the court as the administrative agency in fifteen of the twenty states which enacted laws between 1911 and 1913. In the states in the northeastern section of the country public care of dependent children devolves upon a county or town board instead of a court, and in most of these states administration of mothers' aid was placed in a local board having jurisdiction over dependent children, in the local poor relief agency jointly with the state welfare department or in boards created for this purpose. The development of county boards of child or public welfare in some of the southern states led to the acceptance of these agencies as the logical administrators of mothers' aid. In 1932 the local administrative agencies may be summarized as follows: courts having juvenile jurisdiction exist in nineteen states; county or city child welfare boards,

boards of children's guardians or boards of public welfare in eight; special county boards with no other functions in three; county officials granting poor relief in thirteen; in two states administration is by the state welfare department and in one by a special state commission. The state welfare department assumes in five states joint responsibility with the local unit in the administration and financing of mothers' aid; one state administers the local funds; four states give financial aid to the local units with more or less jurisdiction over administrative standards and several other states exercise some form of supervision over local administration.

In a number of states administration of mothers' aid is still at a very low level. But in most of the large cities throughout the United States and in many entire states there has been a continuous growth in the number of children receiving grants and in the amount of aid given. The standards of aid are constantly being improved, waiting periods are being cut down and the budget plan is used increasingly in determining the amount to be granted to the family on the basis of its total needs and its other resources. As new laws are added and old ones revised, the trend appears to be toward placing local administration in county boards of public welfare. State appropriations to supplement local funds are found increasingly desirable, as is supervision by the state welfare department for the purpose of maintaining high standards in the local agencies.

The laws providing for mothers' allowances in six of the nine provinces of Canada approximate closely those of the United States, upon which it may be assumed they were based. The first of these laws was enacted by the province of Manitoba in 1916. Saskatchewan followed in 1917, Alberta in 1919, British Columbia and Ontario in 1920 and Nova Scotia in 1930. In Canada the federation of labor was an active force in the passage of this legislation. Aid is granted by the provincial authorities through a special commission or by the official or board charged with the care of dependent and neglected children. The source of revenue is the provincial treasury, supplemented in some provinces by a levy on municipal funds. All of the provinces include as beneficiaries the children of widows and of fathers physically or mentally incapacitated in varying degrees. Incarceration of the father in a penal institution, desertion or divorce may be the cause of dependency in some of the provinces, and under the general law of

one province aid may be granted to children of unmarried mothers. All the Canadian laws require that the mother shall be a fit person to exercise custody and control over her children. In some provinces maximum amounts of grants are defined; in others they are determined by the needs of the families. Aid is permitted in most of the provinces until the children reach the age of sixteen years; in others the limit is fourteen or fifteen years; in all cases age maxima are correlated with school attendance and employment regulations.

The New Zealand Mothers' Pensions Law was enacted in 1911 and went into operation the following year. This law, which as amended in 1926 is actually a pension plan, provides that applicants for pensions must be British subjects of good moral character with at least one child under fifteen years and includes widows and women whose husbands are in hospitals for mental diseases. One pound is deducted from the mother's pension for every pound of her unearned income in excess of thirty pounds per year. Grants are for a twelve-month period, after which they are subject to revision. In 1913 administration of old age, widows' and military pensions was placed in one department. Four of the six states of Australia have some form of mothers' pension laws and similar provision is made in the other states without special legislation.

The pension legislation of Denmark went into effect in 1914 and as amended in 1918 and 1920 provides for pensions by the communes (half to be paid by the states and half by the communes) for widows with an income below a certain limit. There are requirements as to fitness of home and of guardianship. The pensions vary according to the ages of the children, the largest amounts being paid for children under two years of age. Pensions are granted until children reach the age of fourteen years and under exceptional conditions until they are eighteen years of age. In addition to widows mothers who are divorced, separated from their husbands or deserted are entitled to pensions unless the father contributes to the family's support. Norway does not have a national law providing for pensions, but the cities of Oslo and Elverum pay pensions to widows, unmarried mothers and divorced mothers who have young children and whose income is below a certain minimum.

In Germany as later in Great Britain provision is made through both social insurance and a pension fund. Under the 1911 provision of the

invalidity pension act of Germany wage earners' widows' pensions are payable at the age of sixty-five and orphans' pensions are payable to children of a deceased insured father who are under the age of fifteen or to the fatherless children of a deceased insured mother. If the children continue in school they may receive the pension until they reach the age of twenty-one. In contrast to legislation fixing grants according to need or at fixed amounts the German system bases its grant on the previous earning status of the insured and provides that the total survivors' pensions may not exceed 60 percent of the earnings of the deceased. Under the system of German social insurance the contributory partners are the employer and the employee, each of whom contributes 50 percent; the government supplements these with annual allowances for widows and orphans. Administration is in the hands of territorial institutes and special insurance institutes serving particular industries; all the institutes are subject to supervision by the federal insurance office. Under two decrees on public welfare promulgated in 1924 aid is provided from public funds for mothers not in receipt of benefits under social insurance law covering death, disability or unemployment. This aid is given to mothers at childbirth and also to mothers of children under a certain age, the amount being determined by the local administration agencies. Presumably this may apply to the classes of children who receive aid under other provisions; that is, children of separated, divorced or deserted mothers.

The British system of social insurance was extended in 1925 by the Widows', Orphans', and Old Age Contributory Pensions Act which came into effect on January 4, 1926. Under the provisions of this act, which applies to all wage earners except non-manual workers earning more than £250 a year, widows of insured men may receive ten shillings a week with the addition of five shillings a week for the oldest child and three shillings for other children. The age limit of fourteen years may be extended to sixteen years if the children continue in school. Pensions are also granted to full orphans. The insurance is financed by funds from employers and employees, who contribute equal amounts, and by a subsidy from the state. Northern Ireland passed a similar law in 1925 providing for a reciprocal arrangement as to the insured with Great Britain. It is interesting to note that the trade unions, the women's cooperative guild and the family endowment societies protested against

the contribution of workers on the theory that the support of dependent children should be a duty of the state. Also allowances were criticized as inadequate. Since many of the recipients of this form of aid formerly came under the jurisdiction of poor laws, it was feared that the inadequate allowances would unfavorably affect as well general poor law rates. Under the act workers' contributions begin at the age of sixteen and terminate at sixty-five; employers' cover the period of employment. For certain classes of workers exempted or in exceptional employments employers alone pay contributions. In 1929 an amendment to the contributory pensions act extended the provisions to widows of men of the insurable class who died before the law went into effect, provided there had been at least one child under fourteen at the time, and stipulating that the pension ceases six months after the youngest child reaches the age of fourteen years. No provision is made for deserted or divorced wives, unmarried mothers or wives of men permanently incapacitated physically or mentally or in prison or in poor law institutions. Administration is under the Ministry of Health and pension payments are made through the post office.

On the continent practically every country with social insurance legislation has in the post-war period made provision for dependent children. The invalidity and old age insurance law of Italy originally adopted in 1919 provides for pensions to widows and orphans. The Belgian law which went into operation July 1, 1932, replacing acts of 1924 and 1925 provides for payments to widows and orphans supplemented by the widows and orphans' fund, to which the state makes a contribution. In France under the social insurance law of April 30, 1930, the widow of an insured man having at least three children under thirteen years is entitled to a temporary pension for each child beginning with the third. Other countries including Czechoslovakia, Austria, Soviet Russia and Sweden provide for pensions to children under certain ages, the limit ranging from thirteen to sixteen. More or less related to the foregoing system of pensions for mothers and children is the provision for maternity benefits.

Another type of public assistance is found on the continent and in Australia in the system of family allowances by the state to employees in the public services; in New Zealand allowances are made to the families of all workers receiving less than a certain income.

Broadly speaking, under the pressure of agitation for social insurance and the endowment of motherhood the tendency has been for public aid to be applied on an ever widening scale as to types of families included and amounts of allowances granted. In the United States, where the family case work system is employed in the granting of this aid, it is possible to study means of bringing about the economic and social rehabilitation of the family. Everywhere there is a growing recognition of the interdependence of such forms of aid with the growth of movements aimed at raising wage standards and lessening the insecurity and hazards of employment, which should facilitate saving and reduce widowhood and dependency resulting from industrial accident, disease and insecurity.

MO TI (c. 480-400 B.C.), Chinese philosopher and social theorist. More religious than Confucius, Mo Ti taught the worship of heaven; that is, of the supreme being (Shang ti), or God, and of His assistants, the spirits. The principle of universal love based on utilitarian considerations is the corner stone of his system. God

sends happiness to those who comply with His commands; those whom a man benefits repay him with kindness. As soon as men have grasped the truth that it is to their own interest to love and help their brothers, war will disappear. Mo Ti's second great principle was economy and frugality. Articles of luxury are useless and cause trouble to the people; the arts are useless and the refined life of culture should give way to the simplicity of primitive times.

To call Mo Ti a socialist, as many Chinese do, is incorrect. Despite the social elements in his ethics he never advocated the abolition of private property, class struggle or mass rule. Like Confucius he would vest state power in a monarch assisted by an aristocracy of scholars and nobles, to whose higher insight the people must bow. Only the ablest men, whether from the privileged classes or the people, would be appointed officials.

For many centuries the school of thought founded by Mo Ti rivaled that of Confucius. It was revived in the nineteenth century and has since been carefully studied by Chinese and Japanese scholars.

MOTION PICTURES

INDUSTRIAL DEVELOPMENT. The first public screen showing of a motion picture took place on May 21, 1895, but it was not until the close of 1906 that the new industry was definitely launched as a commercial enterprise. In its earlier development the motion picture industry was dominated by companies interested primarily in the manufacture and lease or sale of equipment—a peep show device by which a single spectator peered at a continuously moving

film. In order to assure to the purchaser an adequate supply of films the companies which manufactured the exhibiting equipment found it necessary to take charge of film production as well. Exhibitors ordinarily bought films outright at prices ranging from \$10 to \$25 apiece and used them until they wore out.

When technical developments made possible projection upon a large screen so that many patrons could view a subject simultaneously, frequent changes in program became necessary. The exhibitor soon accumulated an obsolete but physically undepreciated stock of films from which he could derive no further profit. In order to eliminate the wasteful process of making a separate print for each exhibitor, so-called film exchanges came into existence; these purchased the films outright from the producers and leased them successively to various exhibitors. Ownership of the film remained with the exchange, while the exhibitor obtained merely a license to exhibit a particular film in a particular place for a stipulated period of time.

But the new film exchanges in attempting to expand their sales clashed with the manufacturers of equipment, who made a practise of selling a machine to an exhibitor only on condition that he use films produced by the seller. As a compromise the leading manufacturers of equipment organized in 1908 the Motion Picture Patents Company, into which they pooled their several patent rights, and came to an agreement with the new middlemen that thereafter distribution of films should be the monopoly of licensed exchanges, which should in return agree to sell only to such theaters as had licensed projecting machines. Because of the tremendous demand for films, however, unlicensed picture producers were still able to offer their products on the market and independent exchanges continued to operate. Realizing the necessity for further consolidation, the members of the Patents Company organized in 1910 the General Film Company, which succeeded, by threatening to revoke licenses, in buying up 57 of the 58 independent exchanges.

The dissolution of the monopoly in 1915 by the federal courts merely completed the effects of underlying economic and aesthetic forces. Both the public and the exhibitors were becoming interested in obtaining better quality pictures, and this led to the rise of the feature picture, which varied in both length and quality. It became increasingly apparent that the traditional policy of pricing pictures at a flat rate

per foot must give way to some system of comparative pricing. For the first time the attempt to anticipate the volatile whims of the public became a major problem. One of the earliest indications of readjustment was the introduction of the "star" system, whereby groups of seven or eight pictures were offered, each group featuring a particular actor or actress. Production costs rose accordingly. Scenarios became more expensive; filming costs increased; while the star insisted on a salary commensurate with his personal attraction.

After the dissolution of the General Film Company, actual distribution was effected, not too satisfactorily, by "state right" exchanges, operating within a more or less limited territory, which bought films of various producers outright or leased them exclusively over a period of years. No exchange could operate profitably so long as it was forced to rely upon the occasional production of the few long pictures which the single producer could offer. On the other hand, the producer, as his output increased, came to feel that he could distribute more economically than could the individually owned exchanges. Furthermore there appeared to be an inadequate number of good exchanges available to any one producer, who then as now felt the necessity of standardized distribution on a nation wide scale and consequently the desirability of actually controlling the distributive organization. With the producer in control, a shrewder price bargain might be struck with the exhibitor and a higher rental obtained. The subsequent development of large chain theaters, the mergers among producers and the integration of producers with theater chains materially augmented the financial strength of the producing companies and consequently minimized still more the importance of the independent exhibitor. In 1929, out of 533 exchanges there were 444 producers' exchanges as against 75 independent exchanges (exclusive of 14 export exchanges); the former, representing 83.3 percent of the total, handled 94.67 percent of the business, the remainder being divided between the independent exchanges, which handled 2.2 percent, and the export exchanges, which handled 3.1 percent.

The entrance of the producer-distributors into the exhibition branch of the industry may be attributed to such technical considerations as the pricing of pictures, competition for desirable play dates, booking, checking on the physical condition of films, collection of rentals and bad

accounts and the inconvenience and expense of disputes. By 1920 a very substantial number of theaters had been acquired by leading producers. From 1920 to 1925 there were no particular indications that this number would be substantially increased. In fact by the latter year the industry had reached a period of temporary stabilization; the leading producers had acquired their own branches for film distribution, independent producers and distributors still held an important position in the industry and the product itself had become stabilized. Except for minor technical improvements, it was commonly believed that the limitations of the silent feature picture had been realized.

Beginning in 1925, however, producer-distributors once again launched a general program of theater acquisition. This may be accounted for by a desire on the part of the distributors to secure a guaranteed outlet for their companies' product, to exploit their films before they had been generally released and to eliminate the competition of independent "booking combines" and well entrenched independent chains. Furthermore a belief developed that the exhibition branch of the industry was one of its most profitable ramifications. Mergers and consolidations in other lines of business suggested a development which could well be imitated in the motion picture industry. The entrance of certain large banking firms, interested in the flotation of new securities, was probably a contributing factor. The advent of synchronized sound and its promise of large profits, the scarcity of sound reproducing equipment and the priority rights on installations secured by chains from electrical manufacturers, the competitive advantage of securing the more strategic locations and theaters before competitors had acquired them and a most unusual stock market condition were also among the important factors which contributed to the growth of theatrical chains in the period before 1931.

A revolutionizing element was injected into the situation in 1928 when sound pictures were introduced. Reluctantly adopted by a few producers, this innovation came in some respects at a most opportune time. With the introduction of sound the electrical companies became vitally interested in the industry. Allied with the electrical interests were various investment and banking houses which sought to make profits by participating actively in the new venture. At the outset the Western Electric Company secured a large part of the available market for recording

and reproducing devices. Subsequently the Radio Corporation of America, the General Electric Company and the Westinghouse Electric and Manufacturing Company became powerful competitors; in fact they decided to enter the industry as producers, distributors and exhibitors of motion pictures. The intercorporate relations which have developed between the motion picture companies on the one hand and the electrical and financial interests on the other have thus become most intimate and diversified. The affiliation of allied interests with the motion picture industry has been extended to include control over music publishing houses, radio broadcasting chains, phonograph concerns and even the legitimate theater. It is thus apparent that the motion picture industry has grown to one of vast size involving interests far beyond those considered to be within its proper field. While the capital invested in the industry increased in the decade 1921-30 from about \$75,000,000 to \$850,000,000 (see Table I), the value of the annual output of motion picture equipment manufactured during the same period rose from about \$4,000,000 to \$14,250,000 (see Table II).

TABLE I

ASSETS AND CAPITALIZATION OF MOTION PICTURE INDUSTRY, UNITED STATES, 1921-30
(In \$1000)

YEAR	TOTAL ASSETS	NET WORTH	FUNDED DEBT
1921	95,969	68,539	9,691
1922	104,796	73,572	15,966
1923	117,593	77,723	22,703
1924	145,930	97,465	25,266
1925	202,249	129,182	35,935
1926	282,829	157,909	71,578
1927	320,695	165,798	105,465
1928	460,956	278,804	128,537
1929	764,566	425,599	227,066
1930	1,001,314	544,400	305,586

TABLE II

VALUE OF ANNUAL OUTPUT OF MOTION PICTURE EQUIPMENT, UNITED STATES, 1921-29
(In \$1000)

YEAR	MOTION PICTURE CAMERAS AND PROJECTORS	SCENERY AND STAGE EQUIPMENT	TOTAL
1921	2,869	1,214	4,083
1923	2,631	1,626	4,257
1925	4,620	3,578	8,198
1927	8,345	5,745	14,090
1929	8,755	5,508	14,263

Source: *The Motion Picture Industry*, Poor's Analytical Services (New York 1932).

According to the United States Bureau of the Census (Fifteenth Census, Census of Distribution, Wholesale, *Motion Picture Films*, 1932, p. 3-4) there were in 1929 approximately 142 motion picture studios in the United States as compared with 127 in 1921 and 132 in 1925. Of these establishments 40.84 percent, producing 70.28 percent of the total output, were located in California; 21.12 percent, producing 23.83 percent, were located in New York state. The films produced were valued, on a production cost basis, at \$184,102,419. The number of persons employed totaled 19,639, of whom 37 were proprietors and firm members, 8818 were salaried officers and employees (including actors) and about 10,784 were wage earners. Salaried officers and employees received \$60,167,520, while wage earners received \$24,860,092. Salaries constituted 32.68 percent of the total cost; wages 13.5 percent; and materials, fuel and purchased electric energy 20.88 percent. Of the total cost value "\$128,406,710 consisted of negative films, the remainder comprising unfinished productions, the development of positive films, receipts for laboratory work done for others, receipts for use of studio facilities, and other work done for others. No less than 92.39 percent of the value of all negative films was in theatrical pictures (both feature pictures and short subjects), in which but 13.06 percent was in silent pictures."

The determination of which pictures to produce presents in some respects the most difficult problem confronting the industry. Unless it can offer box office successes to the public, the company creating the pictures cannot be a financial success. The primary consideration is a large volume of productions which will meet the requirements of producer owned theaters. No company can be expected to turn out thirty or forty pictures year after year and have them all distinctly and uniformly successful. Nor is it likely that the trend toward decentralization of production, desirable though it is, will solve the problem. Real progress must be accompanied, it would seem, by a different approach.

In the era of silent films censorship, however unsatisfactory, involved as a rule a rather simple procedure. Sequences could be deleted and subtitles could be rewritten at the distributor's local exchanges, while the usual fee charged by censorship boards was nominal. The annual cost to the industry of the censorship process in those days was, according to one estimate, approximately \$3,500,000 a year. Since the introduction

of talking pictures, however, the matter of deletion and reediting has become seriously complicated and increasingly expensive. A "Code Regulating Production of Motion Pictures," formulated by the Association of Motion Picture Producers, Inc., and the Motion Picture Producers and Distributors of America, Inc., adopted in March, 1930, has contributed suspiciously little to the solution of the problem. It seems likely that unless the industry takes rather drastic steps, those interested in obtaining more rigid governmental regulation will succeed in forcing their views upon the public.

The production organization is as a rule designed to insure a maximum degree of flexibility. As a rule directors are free to proceed unmolested with their respective assignments, while supervision by associate producers is of an advisory character. Studio cabinets consisting of the principal production officials hold frequent meetings to discuss current problems of the various productions. In general a vice president in charge of production is responsible for the coordination of the production function with the other major functions of finance, distribution and exhibition. He is likely to be assisted by a general manager, who divides his time between the home office and the studio. Under the general manager are the studio business manager, who is responsible for the actual operation of the studio, including projection, sound effects, music and construction, and the production manager, who has charge of costumes, art and location. Other assistants include a chief of publicity, a number of directors and heads of miscellaneous departments.

The story departments, maintained usually as separate units, obtain information and records of stories, plays and other material which may be used as plots for motion pictures. Briefs of all reviewed material go to the studios regularly. If the production heads are interested in a brief, a rough motion picture version is prepared. If this script is approved, it is edited and usually submitted for censorship to the Motion Picture Producers and Distributors of America, Inc. After the approval of a story a price limit is decided upon and the legal department is instructed to complete the purchase.

As a general rule production is planned during the spring for the ensuing year. The estimate of the distribution department as to the number of pictures required determines the production program, which includes the material content and the cost of each picture. The head of the dis-

tribution department and the head of the theater division, if there be one, as well as the president of the company and the head of the production department participate in drawing up the final program. A release schedule, at first tentative in character, is prepared, ordinarily covering the following six months. In view of unpredictable eventualities it is not deemed advisable to lay down definite plans beyond this date. Although changes are of course necessary, the release schedules provide roughly for an average of one picture a week.

The actual production process of the picture usually begins with a directorial assignment, approximately thirty days in advance of the date set for actual production. While decisions are being made in reference to cast, locations and sets, a scenarist completes the script, determining the number of sets to be used, the amount and text of the dialogue, musical scores and other effects. The production manager also appoints a business manager, who with the director decides upon a production schedule and detailed budgets.

Probably no industry has had such a reputation for extreme waste and extravagance, resulting from the excessive salaries paid both to directors and to stars, from the prices paid blindly for stories, from the number of "takes" for individual scenes as well as from many other causes. Within the past few years very substantial progress has been made toward reducing these production costs, primarily because of the business depression but also because of the increasing influence which has been exercised by the electrical and banking interests. Studios are now quite generally on a budgetary system; each unit is expected to keep within its budget. Whereas in former years the average cost of a feature picture ran over \$400,000, in 1931-32 it was probably under \$300,000 with a substantial number of films produced at well under \$200,000.

Distribution activities, which involve the rental of films to exhibitors, the dating in of the pictures, the distribution of films and the collection of the amounts due, are centered in the New York offices of all the major producers. It is from the New York offices that the sales and advertising programs are outlined and the operations of the various exchanges or branch offices supervised. The actual sales plans for the ensuing year are formulated in the spring, and the actual selling of the pictures is customarily preceded by a general convention of the salesmen

of the company, at which time the product is announced as definitely as possible both at the convention and generally through the medium of trade journals. Actual selling begins late in June. Pictures are sold through two agencies. The large chain theaters usually deal directly with the sales manager of the company or with his immediate representative. Since no company produces enough pictures to occupy the entire screen time of its own theaters during any year, it is essential that pictures be secured from other producer-distributors. The arrangements for the purchase of these pictures are a matter of direct negotiation and involve considerable bargaining.

Smaller chains and individual theaters are ordinarily canvassed through the various exchanges, which number from 25 to 32. As indicated above, all the more important companies operate their own exchanges, maintaining one in each of the so-called "key centers." The activities of the exchange, supervised through a director of exchange operations and carried out by the branch exchange managers, include selling pictures and advertising accessories; booking pictures for exhibition; shipping, inspecting and servicing films; billing exhibitors; and making collections. Each salesman is provided with a sales manual, an announcement of the product for the ensuing season and a price classification of product and price schedules for posters and accessories. A contract signed by the exhibitor does not become effective until approved by the general sales manager of the distributor at the home office. In recent years this supervision of the work of the exchanges by the home office has shown a marked tendency toward centralization. Pictures were formerly sold under a "standard exhibition contract," which attempted to provide for all possible contingencies and which was uniform as between all major companies. It provided in detail for the terms of sale, for the machinery of dating in the pictures and for the arbitration of disputes and was for years bitterly attacked by the independent exhibitors, especially those clauses relating to compulsory arbitration.

Today the price paid by an individual exhibitor is the result of a bargaining process. The distributor does not set a specific price on a picture and then sell it to all exhibitors at that price. Frequently he does not even sell it to exhibitors of the same type at the same price. The price actually paid by the exhibitor is, roughly speaking, the outcome of negotiations based upon what the exhibitor has paid in the

past for similar pictures, what the salesman thinks he should or can be induced to pay, the type of picture under consideration, the number of the particular distributor's pictures which the exhibitor is willing to take, the type of theater in which the picture is to be shown and the amount of competition within the area. Pictures are sold almost entirely by description, and only rarely does the exhibitor see a picture before he buys it.

Particularly since the advent of sound there has been considerable experimentation with the rental of pictures on a percentage basis, probably as a result of the large element of uncertainty which existed in the minds of both distributors and exhibitors concerning the box office value of sound pictures. The basis of the percentage division varies widely, frequently involving a guaranty to the distributor with some proportional division of the receipts above that amount. The distributor has often, however, experienced extreme difficulty in securing an adequate check on the box office returns of the individual exhibitors, who have tended to resent outside supervision of their bookkeeping operations; and as it becomes increasingly apparent that the difference between percentage and flat rentals is negligible, it is not unlikely that the percentage arrangement will tend to lose in importance. Under the so-called system of block booking pictures are offered as a group and the aggregate price is in part contingent upon the quantity taken. Some distributors have offered blocks of pictures to the exhibitors on an "all or none" basis. The chief arguments against this policy are that it limits the exhibitor's choice, often forcing him to take pictures which he does not want; that it assures the distributor an income on all pictures regardless of quality; that it causes overbuying on the part of the exhibitors; and that it enables the distributor to usurp the playing time of the exhibitor to the exclusion of other distributors. The main points in its favor are that it constitutes simply a wholesaling technique applied to the sale of motion pictures; that it reduces the cost of distribution and thereby benefits distributors and exhibitors alike; that it simplifies the buying problem of exhibitors by making it possible for them to obtain a year's supply of pictures in a few large purchases; that it insures to the producer a definite income, which enables him to make better pictures; and that it has thus far proved more successful than any other method. The Federal Trade Commission had the policy of block book-

ing under review for some time, and sporadic attempts have been made in Congress to have the practise declared illegal.

In buying a picture the exhibitor has consistently sought to secure from the distributor some protection against the competition of other theaters in his vicinity. The validity of such protection as well as the manner in which it should be provided has provoked much discussion. It is claimed that 40 percent of the total revenue of all pictures is secured from the first run showings in 100 key centers and that 50 percent of the total revenue of a picture is obtained within the first 90 days after its release. Hence a first run house wishes to be certain that no other theater within the same competitive area, possibly charging a lower admission price, will run a given picture "day and date" with it. Furthermore, realizing that many patrons do not wish to wait too long before seeing a new and recently discussed picture, the exhibitor insists that a substantial interval of time elapse between the last showing of the picture in his theater and its first showing in some cheaper house. The amount of protection obtained by any particular theater is only in part dependent upon the price paid by the exhibitor for his films. Other factors, involving the development of chain theaters with great bargaining power, the rise of neighborhood deluxe theaters, the construction of good roads and the widespread use of the automobile, have extended the area from which the clientele for a theater can be drawn.

Even though the practise is firmly established and in many ways justified, much dissatisfaction exists on the part of both distributors and exhibitors with the manner in which protection is actually carried out, as to both the length of time during which protection is granted and the extent of the area covered by the restrictions. That the policy has been overworked by shortsighted executives as a protection against competition, especially in cases where the producer-distributor owns the theater, there seems to be little doubt. Several attempts have been made through the courts to secure relief, and in some cases these have been successful. Substantial modifications are likely to be made as a result of legislative enactment by the interpretation of existing statutes or as a result of realization on the part of distributors that some concessions may well be granted before much larger ones are forced from them. Although it would be highly desirable to establish greater uniformity

of protection, the flexibility necessarily required by local situations has precluded the possibility of finding a generally acceptable solution.

Another serious exhibition problem is that of the control of theater chains. Particularly since 1925 the expansion of the chains has not always been on a sound basis. Many producer-distributors have had no uniform plan for penetration into the exhibition field; independent chains have likewise been guilty of inadequate planning. In a period of mushroom growth and prosperity there was a general tendency to minimize realistic considerations as to how many theaters could be operated profitably under single management, whether the large or the small theater was best adapted to exhibition purposes, whether or not these theaters should be concentrated in any particular geographic area, and why they should be purchased at all. The attempt at readjustment necessitated by the depression has revealed the complexity of problems still requiring solution.

The independent exhibitor likewise has been seriously affected. The trend toward integration and particularly the growth of the large producer-distributor owned chains have rendered his position increasingly difficult. Many unaffiliated exhibitors have withdrawn from the field entirely; others have sought to supply a type of service which they have felt could not be offered in larger organizations. As early as 1920 a national organization, the Motion Picture Theater Owners Association, was established for the purpose of protecting the interests of the unaffiliated exhibitor. Its control, however, passed into the hands of the chain theaters, and in 1929 there was formed a new organization, the Allied States Association of Motion Picture Exhibitors. The efforts of the latter to protect the interests of the independent exhibitor have in some respects been most successful.

For years the settlement of disputes between exhibitors and distributors over provisions in the contract has been a source of great irritation and cost. The Standard Exhibition Contract, adopted in 1922 as a means of eliminating arbitrary variations as between contracts, contained also a clause calling for compulsory arbitration of disputes. The machinery which it set up was built around the local film boards of trade organized under the auspices of the Motion Picture Producers and Distributors of America, Inc., and composed of local representatives of the distributors. These boards were empowered to select distributor representatives to act in mat-

ters of local arbitration, while the exhibitor representatives were as a rule to be chosen by the local exhibitor associations. While it was widely believed that the effort was an outstanding success, a great many exhibitors were bitterly opposed to compulsory arbitration. The Department of Justice maintained that it "constituted an unreasonable restraint of trade." Elsewhere it was felt that the machinery was inadequate and that compulsory arbitration seemed to operate inevitably against the interests of the independent exhibitor. On October 15, 1929, the United States District Court, Southern District of New York, held that the Standard Exhibition Contract, particularly in its provisions relating to arbitration, was illegal. Since this decision a persistent attempt has been made to draft a new contract which would be mutually satisfactory to distributors and exhibitors.

While it is true that the greater part of the revenue received by American motion picture companies is derived from the distribution and exhibition of pictures in the United States, it is probable that the largest American distributors obtain from 25 to 40 percent of their total revenue from foreign distribution.

The American companies have been very successful in their efforts to establish American pictures in the foreign field, which according to a recent estimate includes almost twice as many theaters as there are in the United States (Table III). This is due partly to chance, partly to natural advantages for production and partly to the keenness of the men responsible for the direction of the industry. On the other hand, the dominance of the American distributors, both through the control of their own chains and through their relations with independent theaters, makes it extremely difficult for any European producer to distribute in the United States. The importance of American films in certain foreign countries is shown by the figures in Table IV.

It was not to be expected that this situation would be permitted to continue without strenuous opposition on the part of producers abroad. In the first place there was the obvious suggestion that Germany with 5000 theaters, the United Kingdom with 4500 theaters and France with 3000 theaters could each support one or more distributing companies whose pictures might find preferred showing in their own theaters and perhaps have some exhibition value elsewhere. This economic reason was strongly supported by a telling political and social argument. The power of motion pictures to influence the conduct and beliefs of people is clearly recognized. It is perfectly natural therefore that the Germans should be concerned with the effect of American motion pictures upon public opinion in Germany. To subject millions of people in Germany to this subtle influence time after time would have the effect of developing a favorable response not only to American attitudes of mind but also to American goods other than pictures.

This situation was seized upon very early by those who thought that it would be to their economic advantage to develop a native motion picture industry. The first of the important European countries to take action was Germany. The German *Kontingent* law stipulated that foreign pictures could be imported only through the purchase by a foreign producer or distributor of a permit, or *Kontingent*, issued to the domestic producer on the completion of a picture. Subsequently a straight import permit was substituted which definitely restricted the number of imported foreign films. It sought to insure to German producers a definite portion of the

domestic market. Moreover, since the domestic producer could sell his product to whomsoever he pleased, it placed within the power of the German producer the right to decide which foreign countries would be permitted to export pictures into the German market. The introduction of sound in 1928 further modified the situation. The German public wants to see sound pictures and it wants pictures with understandable dialogue. The result of the two combined forces naturally is reflected in an increase in the number of producing companies in Germany and a decreased importation from the United States. On the other hand, the experience of Germany with the *Kontingent* can scarcely be said to be satisfactory. Exhibitors have found difficulty in getting a sufficient number of pictures to meet their requirements. German producers have not been able to create pictures equivalent in quality to those which could be obtained elsewhere, and the public in some instances has reacted against them. Some modifications have been made in the law since 1928, but the situation continues substantially as described.

The original French film decree of February 19, 1928, authorized the release of foreign films on the basis of import permits. A control commission fixed the number of permits, which were issued in a definite ratio to domestic films shown. The French export situation resulted in a long series of negotiations between American and French interests, which finally culminated in a tentative agreement. The English law, instead of being concerned directly with the number of foreign films which may be imported, requires that the English exhibitors reserve a certain portion of their screen time for British pictures. Under the Cinematograph Films Act, which became effective on January 1, 1928, the restriction quotas were set for a ten-year period. The Austrian and Italian laws are based on regulations similar to those which prevail in Germany and France. Closely related to the problem of film importation is that of an extremely complicated international patent situation, all the more involved because of the underlying political considerations.

HOWARD T. LEWIS

SOCIAL IMPLICATIONS. The general character of motion pictures under private ownership and development is determined almost entirely by the economic nature of the product. Photographic film admits of mechanical duplication

and is clearly subject to the "law of increasing returns." It reflects therefore the effort of its financial backers at mass appeal and has been confirmed in this tendency by the methods of wholesale distribution and exhibition adopted in the United States, and to some extent in Great Britain and Germany. The economic motivation is conspicuous in the history of the American motion picture, which was developed almost entirely by persons of humble origin, mostly Jewish, who entered the "show business" in the days of the penny arcade with little capital but a keen instinct for the exploitation of popular appetites. Some of them have subsequently acquired a certain degree of education, of aesthetic appreciation and ambition; to others technical and financial advance has given an opportunity to exhibit the same motivation on a wider, but hardly a higher, plane.

With the constant increase in the size of the market the industry traveled the familiar road which led through expanding output to large scale production. Investment and working capital were multiplied with unprecedented prodigality, while production costs rose on a wave of reckless extravagance. Whereas in 1913-14 D. W. Griffith's spectacular and very profitable film *The Birth of a Nation* cost about \$100,000, costs of \$1,000,000 were frequent twelve years later. Cecil de Mille spent \$2,300,000 on *The King of Kings*, and the Metro-Goldwyn-Mayer concern put up \$4,000,000 for a half interest in *Ben Hur*. Salaries of leading players were advanced to fantastic levels reflecting their real or imputed drawing power. Such expenditures naturally entailed an increased dependence on the size of the market. As in other such cases the eventual results were the elimination of the small producers and a bitter struggle to control the market, culminating in a very expensive policy of theater proprietorship on the part of the leading firms and their associates.

In order to maintain the rapid changes of program which competitive conditions appeared to demand, the number of films produced also increased greatly, reaching a total of six to eight hundred annually in 1929-31. Under no circumstances could more than a small proportion of such an output be interesting. But in this way the maintenance of the widest mass appeal became a matter of financial life or death to the industry; and the cultural aspects of the American film were thus almost exclusively determined. The circumstances were distinctly adverse to artistic or thematic experiment. A

selective appeal was precluded by the scale of production and distribution. Exhibitors developed a horror of the "highbrow" picture and emphasized the financial failure of films which demanded more than the most rudimentary intelligence on the part of the spectator. While artistic or thematic significance was not entirely precluded by this attitude, it was made conditional on the maintenance of mass appeal—a somewhat difficult condition for such significance to fulfil. So long as the industry is equipped and financed on the assumption that 90 percent of the "product" must appeal to every possible type of audience—to the "hick towns" of the middle west as well as to the playgoers of New York and Philadelphia—no rapid intellectual or artistic progress need be expected.

Further it must be noted that the arts of music, drama, opera and the ballet owe much of their cultural advance to disinterested patronage of various kinds, under which selected audiences have encouraged and eventually popularized artistic innovations. The economic circumstances of the motion picture, especially since the introduction of the sound film, have rendered this difficult, except in Russia. The manager of a motion picture theater is not, as is the manager of a stage theater or a concert hall, an artistic entrepreneur; he is merely the retailer of a "product" manufactured for mass entertainment. There have been in the United States as in Europe a few independent producers of experimental or purely "art" film; but there are no regular channels through which their efforts can be made available to the public. In London the Film Society—a subscription and non-commercial enterprise—has acted for several years as a medium for introducing to the intelligentsia foreign and domestic pictures of minority interest; and its organization has been duplicated in Oxford, Cambridge and a number of provincial cities. In the United States there has been no centralized means of distribution or exhibition of exceptional pictures. There were, until the coming of sound, perhaps two or three dozen small exhibitors maintaining a somewhat precarious existence for special types of audience. The distribution system of the Hollywood concerns denied them a selection of the more popular screen material; the introduction of sound presented them with a financial problem to which their resources were in many cases unequal; and the trade depression still further thinned their ranks. Unaffected by their influ-

ence, the commercial film has therefore followed rather than led the herd mentality. It has embodied not simply the crowd instincts and stereotypes of mass psychology but the interpretation of these as viewed exclusively from the profits angle by the salesmen's and exhibitors' conferences, which have the ultimate control of production policy.

While therefore the technical development of the American motion picture has reached a very high level, its artistry and ideology have remained extremely conservative. This conservatism, dictated by the financial assumption of mass appeal, has been reinforced by the industry's fear of offending any influential group in the community. The organization of Motion Picture Producers and Exhibitors of America, Inc., by Will H. Hays, early in 1922, arose out of the industry's apprehension of adverse political action following a succession of unsavory events involving film personages. The Hays office adopted from the start a policy of cooperating with critically minded groups under the slogan "Selection not censorship." It arranges for the previewing of films by representatives of women's clubs and religious organizations and assists in giving publicity to their endorsements of inoffensive pictures. These and similar societies have in many cases organized locally to exert what influence they can on the exhibitors in favor of "endorsed" films. The point of view of such groups is mainly moralistic, expressing the mores of the consciously conservative elements in society. The production code of the industry, drawn up and enforced through the medium of the Hays office, is similarly conservative in effect, consisting of negative maxims expressly designed to avoid conflict with the ethical, political, racial or religious attitudes of the mass of the people. The result is that in comparison to the freedom with which social or individual issues are handled in literature and drama the motion picture scarcely figures as a factor in ideological advance. Such current issues as appear on the screen are selected rather for their "publicity value" than for their intrinsic significance, and those on which public opinion is strongly divided are either avoided or handled in a manner which evades their more controversial aspects.

The National Board of Review, originally organized in New York in 1909, gives considerable attention to other than the merely moralistic aspects of the pictures it reports on. The board works through "better films committees" in the

localities, of which the membership, like its own, is individual rather than representative of organizations. Like the other groups it is dependent on the industry itself for its previewing and some other facilities; but otherwise its connection is much less close. It is one of the few previewing organizations which keep systematically in touch with the newer developments in art and technique. From this point of view the average list of "approved," or "endorsed," films is not encouraging. Inasmuch, however, as all such effort comes into effect only through local groups of "publicly minded" (and often self-appointed) citizens, the moralistic approach on the whole prevails. It is difficult for a heterogeneous and usually untrained group of people to agree on an interpretation of the term "better" without falling back on the popular mores.

The social significance of the film remains as it was described by Milton Sills, a popular movie star of the early 1920's, in a lecture at the Harvard Business School in 1927: "Just how does this form of amusement function as compensation to the drudging millions? By providing a means of escape from the intolerable pressure and incidence of reality. The motion picture enables the spectators to live vicariously the more brilliant, interesting, adventurous, romantic, successful, or comic lives of the shadow figures before them on the screen. . . . The film offers them a Freudian journey into made-to-order reverie, reverie by experts. Now reverie may be unwholesome—our psychological studies are still too immature to decide this question—but in our present form of culture it seems to be necessary. In any case, reverie engendered by motion pictures is certainly more wholesome than that engendered by the corner saloon or the drab walls of a tenement house. For an hour or two the spectator identifies himself with the hero or heroine; potential adventurer at heart, he becomes for the moment an actual imaginative adventurer in a splendid world where things seem to go right." A further comment on film ideology, still largely true, was supplied in the same course of lectures by Cecil de Mille: "When a star reaches the point where the sales department can 'sell' him or her, then he or she gets most of the weak stories. The good stories will sell themselves, and the star doesn't need a good story."

The development of more intelligent film criticism in the press and the success of the large number of adaptations from the stage have done much in recent years to improve the quality of

both acting and scenarios. On the other hand, the block booking system, whatever its financial pros and cons, is probably a retarding influence on film quality since it acts as a strong buffer between critical opinion and sales. A further retarding influence has been the monopolization of the domestic commercial screen by pictures produced in the United States. Several of the foreign producing concerns maintain distribution centers in this country, but the exhibition of their product is practically confined to the very small number of independent concerns catering to special publics. On the other hand, American film is largely shown everywhere except in Soviet Russia and in Italy, although its sharpest critics are found in foreign lands. There have been vigorous efforts on the part of other countries to restrict the proportion of American film or to increase that of domestic by the quota system; and the economic as well as the cultural results of film export cannot as yet be said to have contributed much to international amity. The cinema committee of the League of Nations is endeavoring to secure international free trade in educational and cultural films; but the technical and other difficulties of the attempt are evident and serious.

Both in the Soviet Union and in Italy the governments, either directly or by subsidy, have actively promoted the production and exhibition of films designed to strengthen national self-consciousness and to guide it in a desired direction. In the former production policy as well as the training of cinema artists and technicians is under the direct charge of the federal and constituent states. In the latter the state supports and controls L'Unione Cinematographica Educativa (LUCE), which in addition to producing films of approved quality, distributes independent commercial product as well; Italian exhibitors are compelled to include cultural, educational or propaganda films in their programs. In Germany the Lampe Institut, staffed and partly supported by the state, supervises, encourages and correlates the production and distribution of artistic, educational and interest films; their exhibition in commercial theaters is further encouraged by the remission of entertainment taxes. The Japanese government as well as certain semipublic bodies in Japan undertakes the production of cultural and educational films and has greatly facilitated their exhibition in the schools. The French government has limited its direct activities mainly to the classification of films and the collection, for loan purposes, of

educational ones. In this latter connection the state meets part of the cost of projector installations in the schools. The most important step recently taken in England is the endorsement by the government, and its financial support, of a projected film university, which will not only act as a center of collection and distribution of non-commercial film but will engage in all phases of education related to or suitable for treatment by the cinema. By comparison with the foregoing, the attitude of public authority in the United States reflects the same general policy of leaving cultural values to look after themselves as is seen in the broadcasting business, although certain government departments, museums of art and universities have made non-commercial film collections available for educational showing. The "news reel" films generally shown in commercial theaters may perhaps be credited with some educational value; but they suffer from the same conservative influences as above described and have lost a good deal of their authenticity by their increasing devotion to subjects specially posed for the camera.

There has been for many years a voluminous controversy waged on an international scale as to the effect of the cinema upon children and adolescents. In England and America there are movements, mostly voluntary, to discourage or prohibit attendance of children at films classified only for adult showing and to encourage special showings of films for children; but a recent and most authoritative British report (*The Film in National Life*, 1932) urges that the line of advance is to improve the general quality of the films rather than to encourage the further segregation of the child from the adult by restrictive action. The same report endorses a statement of the British home secretary in Parliament to the effect that "on the whole the cinema conduces more to the prevention of crime than to its commission." In general the conclusion is that restrictive or censorial activities are less important than constructive policies devoted to the dissemination and preservation of cultural values. In education, while the informative possibilities of the film are obvious, there is the handicap that it tends to encourage too passive an attitude on the part of the pupil. Recent investigations show that certain types of mind respond more readily to visual than to oral presentation; but the best current opinion emphasizes more and more the need of carefully planned integration and active response, if film presentation of subject matter is to be genuinely

educational. In this respect much existing film of the merely informative type is unsuited to modern teaching technique. Mention must be made, however, of the jointly educational and commercial success of the British Instructional Films and some of the German Ufa and Russian Sovkino productions, which combine exceptional cinematic merit with valuable content.

It is an open question whether an art which relies almost exclusively on mass appeal can adequately preserve or foster the higher cultural values. Great art and mass appeal are not inconsistent, but their coincidence in any medium is too rare to constitute the sole assurance of cultural progress. It has been suggested that the world wide dissemination of American film will at least encourage the spread of the English language as well as of American trade. To some extent this is true; but there are strongly nationalistic tendencies in the films of all nations, particularly of those subject to severe American competition, and in view of the ease with which the film lends itself to propaganda its influence in a world of increasing international tension must remain debatable.

MOTLEY, JOHN LOTHIROP (1814-77), American historian and diplomat. After graduating from Harvard in 1831 Motley spent two years in Germany, where at Göttingen and Berlin he attended various lectures, chiefly on civil law. Returning to Boston he continued his legal studies and in 1839 published an unsuccessful historical novel. During the next ten years with the exception of a brief absence of three months as secretary of the American Legation in St. Petersburg he studied in Boston, turning out occasional historical and literary essays and reviews and in 1849 a second and more successful novel. In 1851, having become absorbed in the generally neglected story of the uprising of the Dutch against the duke of Alva, he went to Europe, where over a period of four years he carried on exhaustive researches in the archives of Dresden, Brussels and The Hague. In 1856 he published his celebrated masterpiece, *The Rise of the Dutch Republic* (New York), a work in three volumes covering the struggle for Dutch independence from Spain in the period from 1555 until the death of William the Silent in 1584. The dramatic plot, the dignified style and the enthusiastic libertarianism of the author stamped it as one of the outstanding literary and historical productions of the nineteenth century, although the appraisal of the two contending forces was strongly colored by Motley's anti-Catholic outlook. In the years between 1856 and 1868 Motley published another monumental work, *History of the United Netherlands from the*

Death of William the Silent to the Twelve Years' Truce (4 vols., New York), covering the period from 1584 to 1609. In *The Life and Death of John of Barneveld* (New York 1874)—a somewhat anticlimactic sequel for the period from 1609 to 1619—Motley's strong Unitarian sympathies blinded him to the merits of Maurice and of the other strictly Calvinistic opponents of Barneveld. In general it may be said that all of his volumes are marred to a slight degree by his inadequate knowledge of general European history. During the American Civil War Motley was minister to Austria; in this capacity he wrote numerous letters attempting to acquaint Europeans with American civilization. These were published in 1889 (his *Correspondence*, ed. by G. W. Curtis, 2 vols., New York). In 1869 he served as minister to Great Britain but the next year he was recalled, charged with excessive Anglophilism.

MOTOÖRI, NORINAGA (1730-1801), Japanese historian. Motoöri was born in the province of Ise. After studying Confucianism and medicine he came under the influence of the Japanese classics and became a disciple of Kamo Mabuchi. He carried on the work of the latter and became one of the greatest figures in the movement of the classical renaissance which later played a great role in the restoration of 1868. His works, the productions of a keen scientific mind, contributed much to the creation of the new school of classical study which sought to break away from the school of Chinese classics then predominant in Japan. His influence was most important in the interpretation of Shintoism. He evolved a new concept of God in Shintoism and based all his philosophy of the state as well as that of human conduct on this. He confessed to the belief that man was first created by God and that all human conduct was dictated by His will. This divine law was left.

according to him, in the custody of the sun goddess, Amaterasu, the ancestress of the imperial family. Hence the emperor was the spiritual as well as the political center of the nation and his will must be accepted as that of God and obeyed by all the Japanese. He explained also that all the actual rulers of the country had been successful only when they had respected the will of the emperor. He traced the Tokugawa shogun's success to the same reason. He did not intimate the overthrowing of the Tokugawa regime, but it was quite natural that his theories when carried to their logical conclusion became one of the main intellectual forces that brought about the destruction of the shogunate in 1868.

MOTOR VEHICLE ACCIDENTS. The increasing modern use of the motor vehicle has brought in its wake the motor vehicle accident; and despite better built automobiles and trucks, more and better roads, more traffic regulation and intensive and well organized safety campaigns traffic accidents have steadily mounted. Motor vehicle accidents in the past decade have almost consistently shown a tendency to grow with the increase in the number of registered motor vehicles and the rate of gasoline consumption, or motor mileage. The result has been that in the United States, since 1927, motor vehicle fatalities have stood highest in the list of accidental deaths. Thus in 1911 deaths from motor vehicle accidents (excluding collisions with street cars and railroad trains) made up but 2043 out of the total of 79,305 accidental deaths in the registration area, or less than 3 percent; in 1927 motor vehicle deaths totaled 23,251 out of a total of 95,496 accidental deaths, or 24 percent; in 1930 they totaled 29,080 out of 95,527 accidental deaths, or 30 percent. The Travelers Insurance Company has estimated that motor vehicle deaths for the whole United States numbered 34,400 persons in 1931 and 29,000 persons in 1932.

The ever growing threat of the automobile and truck to the lives of modern populations can be shown also in the ratio of motor vehicle deaths to population and in the ratio of such deaths to registered cars. The rate of motor vehicle fatalities increased from 1.8 per 100,000

population in the registration area of the United States in 1910 to 10.4 in 1920, 24.5 in 1930 and 24.9 in 1931. The number of motor vehicle fatalities per 100,000 registered cars and trucks in the United States was 136 in 1920, 110 in 1925, 118 in 1929 and 127 in 1931.

Fatalities in European countries have naturally been fewer than in the United States in view of the smaller number of cars on streets and highways; but proportionately, particularly in terms of registered cars, they have been as great if not greater. Thus in London the number of motor vehicle deaths per 100,000 registered cars was 298 in 1926 and 372 in 1928; in Paris the fatality rates for 1926 and 1927 were 112 and 109; in Berlin the rates for the same years were 257 and 227. In three of the largest American cities the fatality rates per 100,000 registered vehicles for 1926 and 1928 were as follows: New York, 170 and 140; Chicago, 200 and 221; Los Angeles, 65 and 70.

Motor vehicle accidents continue to take an alarming toll of child life, but the recent declining proportion of child fatalities out of the total number justifies a hope that educational campaigns have not been without result. In the United States the proportion of fatalities of children (i.e. those under 15 years) out of total fatalities in 1922 was 29.4 percent (collisions with heavier vehicles excluded); in 1926 the proportion was 23.2 percent; in 1927 it was 22.0 percent; and in 1928 it was 19.8 percent. Put in another way, between 1922 and 1928 the total number of motor vehicle fatalities increased 82.2 percent; but child fatalities increased only 22.9 percent as compared with an increase in adult fatalities of 106.9 percent.

A study of street accidents to children in Greater London showed that 932 children under 15 years were killed, for the most part by motor vehicles, between the years 1925 and 1928 inclusive. Up to the age of 5, when the number of deaths was greatest, the fatalities gradually increased with the age of the victims; after age 5 there was a decline until age 14 was reached, when fatalities suddenly rose again. The principal causes of death among child pedestrians were distributed as follows: running across streets without due care, 362; playing in streets, 109; passing in front, behind or between stationary vehicles, 94; improperly riding on vehicles, 62; running from behind vehicles, 51. Eighty-four pedal cyclists also met death as a result of skiddings, collisions and the like.

For each person killed by a motor vehicle in

ch : United States as many as 35 sustain more or less serious bodily injuries. In 1927 the ratio of non-fatal injuries to fatalities in the state of Connecticut was 34 to 1 and in the state of New York it was 35 to 1. If unreported injury accidents could be included these ratios would be increased, perhaps considerably. In 1927 the London ratio was about 45 to 1; in Berlin it was about 63 to 1; and in Paris it was about 130 to 1, although in this city the police included among the injured great numbers of persons who were only slightly hurt. Of the persons injured but not fatally perhaps half are pedestrians. This proportion varies widely, however, from year to year and in different places. In Massachusetts in 1926 there were recorded 25,351 non-fatal injuries distributed by groups as follows: pedestrians, 56 percent; occupants of cars, 37 percent; bicyclists, 3 percent; motorcyclists, 2 percent; others, 2 percent. Of the some 100,000 non-fatal injuries reported in New York state in 1928 the following was the distribution by nature of injury: slight shock and shake up, 67 percent; severe general shock with contusions and lacerations, 12 percent; miscellaneous fractures, 7 percent; miscellaneous injuries, 6 percent; not stated, 6 percent; internal injuries, 1 percent; concussion of the brain, less than 1 percent; fractured skull, less than 1 percent; fractured spine, a few (49 in all).

The reporting of motor vehicle accidents has not yet reached a standardized basis, with the result that comparable data over a period of years and for different countries are difficult to collect. This is particularly true of the causes of such accidents. The Travelers Insurance Company, however, prepares annually elaborate estimates for the United States, based on the detailed reports from states containing 90 percent of the country's population; these are adequate for an estimation of existing trends. In the year 1932 the following four major causes were responsible for American motor vehicle fatalities: the condition of streets and highways, 30 percent; defects in the motor vehicle, 9.6 percent; children playing in streets and pedestrians using roadways, 43.8 percent; the condition and behavior of the motorist, 70 percent. Both direct and contributory causes are included in the above tabulation, with the result that there is a considerable amount of duplication.

It is important to observe that despite great strides made in the science of road building in recent years, road and street conditions still account for almost one third of the fatal acci-

dents. Many traffic hazards, such as narrow bridges, sharp curves, insufficient sight distances, blind intersections and unprotected grade crossings, continue to exist and accidents from these causes probably will not diminish until even greater efforts have been made for surmounting them. Among suggested improvements of the highway, most of which are already being carried out in many localities and with some reduction in the number of accidents, are removal of obstructions, the rerouting of traffic, the placing of warning signs and improved lighting. In at least one state the proposal has been made that all main thoroughfares be adequately lighted throughout and that cars using them be required to dim their headlights.

The recent improvements in motor vehicle construction account for the comparatively slight proportion of fatal accidents due to mechanical conditions of trucks and automobiles. The most frequent causes for accident here are glaring headlights, imperfect headlights and tail lights, defective brakes, worn tires, imperfect steering mechanism, absence of chains and the lack of proper windshield cleaners and rear vision mirrors. Increasing vigilance on the part of police authorities and periodic inspection of motor vehicle equipment have gone far in keeping vehicles in good condition. It must be conceded, however, that the mounting cost of public agencies responsible for enforcement of such laws and the occasional heavy expenditures motorists must meet to comply with official regulations concerning equipment tend to make both inspections and motorist compliance perfunctory.

Although the estimate referred to for 1932 shows that children playing in streets and pedestrians using roadways accounted, at least in part, for 43.8 percent of the motor vehicle deaths, the accidents among this group have shown marked proportionate declines in recent years. This is due in part to the successful educational work carried on among children and the better police protection afforded children of school age. Naturally pedestrian accidents occur more frequently in urban than in rural areas; in cities about 60 percent of fatalities involve pedestrians, while in the country the proportion is only 30 percent. The nature of the hazards to pedestrians is indicated in the following distribution of the causes of pedestrian fatalities in 1932: crossing at intersections (with signal, no signal, against signal or diagonally), 23.5 percent; crossing between intersections, 28.8 per-

cent; coming from behind parked car, 9.0 percent; children playing in street, 10.8 percent; walking on or along rural highway, 13.8 percent; miscellaneous (waiting for or getting off street car, getting on or off another vehicle, at work in roadway, riding or hitching on vehicle and so on), 14.1 percent.

To cope with these various problems presented by pedestrian traffic the following special provisions have recently been discussed and in some places already adopted. *Marked crossings.* These are becoming increasingly common in American cities; parts of Paris and Berlin and a few points in London are already well marked. *Safety isles.* These are more common in foreign cities than in the United States. Zones of safety for street car passengers at stated halting places are in use in many American cities; footpaths on interurban highways would remove one source of risk for the pedestrian. *Underground walks.* A few subways for pedestrian traffic have been opened in American cities, notably in Los Angeles, which has fifty or more. In London there are a number, for the most part in connection with stations of the London Underground; the longest is at the South Kensington station and the most complex is at the Elephant and Castle station. There are two pedestrian subways in Berlin. Subways which lead simply from one sidewalk to the other do not ordinarily attract many pedestrians. *Overhead bridges.* These are not very frequently encountered, being even less numerous than underground walks. *Traffic lights.* Within the past decade these have become a common sight in cities and towns in the United States. They serve the double purpose of expediting traffic for motorists and reducing collisions with other vehicles or with pedestrians. *Educational campaigns.* These are carried on in a great variety of ways. The schools are learning to do much, as a part of their daily routine, in instilling in the minds of pupils care in the use of the streets. The public, including both driver and pedestrian, is being reached through the medium of the press, by placards posted at conspicuous points or carried on street cars, and in other ways. This work is being fostered in the United States by such organizations as service clubs, chambers of commerce and especially the National Safety Council. In Great Britain a similar organization sponsoring safety work is the National "Safety First" Association; in Germany there is the Deutsche Verkehrswacht.

The condition and behavior of the motorist

contributed to fatalities in 70 percent of the motor vehicle accidents in the United States in the Travelers Insurance Company estimate for 1932. The leading actions of drivers as a result of which deaths resulted were the following: exceeding the speed limit, 35.3 percent of all accidents in this group; on wrong side of the road, 12.3 percent; did not have right of way, 11.9 percent; cutting in, 2.9 percent; drove off roadway, 18.8 percent; all others, 19.8 percent. It will be observed that the accidents arising from the first three causes, constituting almost three fifths of the fatalities in this group and two fifths of all the fatal accidents arising out of the use of motor vehicles, may be directly laid at the door of the motorists themselves. Speeding and reckless driving are among the greatest menaces of the road, and the problems they present are among the leading concerns of public officials supervising motor transportation and traffic regulation. Mechanical restriction of the speed of vehicles has been suggested many times but the proposal has been nowhere adopted thus far. There are two reasons standing in the way: no device has yet been invented which could not be tampered with; and the prevention of necessary acceleration at critical moments might in itself prove a source of accident rather than a preventive.

During the early years of the motor age any person could drive an automobile or truck without restrictions except perhaps as to speed; indeed today in some of the American states, particularly in the south and west, there are still literally no formalities. One is as free to operate a motor vehicle as to drive a span of horses. In Great Britain there are no qualifications, except a minimum age limit, for an ordinary driver's license; an applicant simply remits five shillings and receives a license by mail. In most European countries, however, in Australia, South Africa, New Zealand and Canada and in many states of the United States applicants for permission to operate must submit to a more or less rigid test or examination. This covers in general four points: skill as a driver; knowledge of rules of the road and of motor vehicle laws; familiarity with mechanical details of the car; and physical fitness, particularly as to sight and hearing. In the United States licenses are commonly granted for one year only but are renewable; in Germany they are granted for life or until revoked.

New York and Connecticut in 1901 and Massachusetts in 1902 were the first American states to enact legislation concerning the control

and operation of motor vehicles. Additional legislation in Massachusetts in the following year provided for the registration of motor vehicles and the issuing of licenses to operate them. The examination of one class of operators only, namely chauffeurs, began in Massachusetts in 1907 and continued until the inauguration in 1920 of the present system, which provides for the examination of all applicants. Drivers' licenses are now required in about half of the states of the United States. All of the states require registration of the vehicle.

The common minimum age limit for drivers in the United States is 16 years. In Great Britain it is 21 years for public service drivers, 17 years for motor car drivers and 16 years for motorcyclists. In France and Germany the age limit is 18 years. It is perhaps true, although statistics on the subject are as yet very meager, that young drivers cause more than their share of accidents. Drivers of commercial vehicles receive special attention in the United States and in England in the form of schools of instruction and "safe drivers" competitions. England has also a Road Fellowship League designed to cultivate a spirit of mutual consideration among drivers in the use of the highways.

One of the most pressing problems that have appeared in connection with motor vehicle accidents is that arising out of the inability or failure of operators and owners of trucks and automobiles to compensate the victims of accidents both for physical injuries and for economic loss. It has been established by the Committee to Study Compensation for Automobile Accidents that considerably less than one third of all private passenger and commercial motor vehicles registered in the United States are insured for public liability, or injuries to persons; as a rule common carriers are required to carry such insurance. By 1932 some eighteen states carried on their statute books financial responsibility laws, designed for the most part to increase the number of financially responsible owners and drivers by requiring those who had been at fault in the commission of accidents either to pay damages to their victims or to insure themselves against public liability in the future or both, but these laws were not proving particularly successful.

In the United States it is only in Massachusetts that effective efforts have been made to see that the injured persons are not without sure relief. By law enacted in 1925 and effective as of January 1, 1927, Massachusetts required that all

motor vehicles belonging to resident owners be insured against public liability. The statute demanded that each resident owner give proof of financial responsibility with respect to personal injury before the registration of his motor vehicle was possible, the proof being usually a certificate of insurance covering the owner and all operators as well. The statute also empowered the state insurance commissioner to establish the premium rates for all classes of coverage. According to the Committee to Study Compensation for Automobile Accidents, more than 90 percent of motor vehicles operating in the state have been brought within the insured group and the law has thereby achieved its purpose of protecting the public against the financial irresponsibility of motorists. Similar compulsory liability insurance laws were enacted in Denmark in 1918, in Finland in 1925, in Norway in 1926 and in Great Britain in 1930; some of the cantons in Switzerland have also undertaken legislation of this kind.

But students of the question are not convinced that insurance, even on a compulsory basis, offers the best solution. The Committee to Study Compensation for Automobile Accidents (*Report*, p. 216) thus sums up the outstanding objections: "The generally prevailing system of providing damages for motor vehicle accidents is inadequate to meet existing conditions. It is based on the principle of liability for fault which is difficult to apply and often socially undesirable in its application; its administration through the courts is costly and slow. . . ." Therefore the committee favors a plan of compensation with limited liability and without regard to fault, analogous to that of workmen's compensation. The committee's proposal, which has gained the serious attention of many persons alarmed by the growing seriousness of the problem, embodies the following suggestions: first, that the principle of negligence or liability for fault be discarded; second, that every motorist involved in an accident be required to pay compensation for injuries or death caused by his motor vehicle; third, that such payments be made on the basis of a statutory scale of benefits; and, fourth, that all motorists be required to carry insurance against their liability to pay compensation.

MOTOR VEHICLE TRANSPORTATION came late into the family of transport agencies. A century of intermittent experiment had foreshadowed the automobile but without suggesting the amazing rapidity of its development since 1900. From possibly 600,000 in 1910 the number of motor vehicles in the world increased to 11,000,000 in 1920 and to 35,000,000 in 1931; these figures indicate their past without presaging their future curve of growth. Motor transport

has won its present place partly by displacing horse drawn vehicles, partly by capturing steam and electric railway traffic and partly by increasing the total amount of transportation. Exceptionally diversified in form and function, it has become conspicuous in both the freight and the passenger fields; in local, radial and intercity movements; and in public and private transport service. It fills with a finer weave the coarse meshes of the railway net and it also opens up areas unmarked by rails. Although its contributions in both of these directions have already been notable, motor transport continues to display a vigor and versatility which preclude confident prediction of the magnitude of its final place in the transportation scheme.

In number of vehicles operated the United States, with almost three fourths of the world's total, is clearly the outstanding country; and the private passenger car is easily first in both volume and significance. In other countries the preponderance of the automobile is not so great; in Russia and a few other areas motor trucks and buses together are more numerous. In the United States the private car has resulted in a tremendously increased total of transportation service. While it has cut deeply into the province of horse and railroad, but a minor part of the 300,000,000,000 passenger miles accumulated annually through its use is thus to be explained. With the means available for exploiting a wider field of experience, man has become more mobile, and the motor car now ranks as a leading consumers' good. It is true of course that the automobile has become a necessary business adjunct; but its use nevertheless is largely a function of income otherwise derived. In the United States the ratio of passenger cars to population in 1931 was 1 to 5.5; in England and Wales, 1 to 40; in Italy, 1 to 197; in Japan, 1 to 1100; and in China, 1 to 16,000. Although other factors are present—among them, inequality in the cost of vehicle ownership and operation—a direct relation of car registration to income is generally to be observed.

Passenger transport of an individualized character is provided commercially in towns and cities by the taxicab, which in western nations has displaced other facilities in this field. But as an agency of public passenger transportation the motor bus, or coach, operating as a common carrier both within and between cities, is of chief importance. With both spheres of use included, bus routes in the United States exceed the line mileage of steam railways and account for prob-

ably half as many passenger miles, although not one tenth as many as the private car. More than two thirds the world's buses are found outside the United States, their most intensive utilization occurring in England, with noteworthy beginnings in the industrially backward regions of Asia and Africa. The rapid increase in bus travel since 1920 is attributable largely to improvements in safety, reliability and comfort.

In meeting the requirements of large cities motor buses are clearly unequal in speed, and probably unequal in cheapness, to the underground and the suburban railway. They are more expensive also than well patronized street railways, and their inadequacy as a means of mass transportation for cities exceeding 30,000 in population has frequently been stressed. Buses have seemed ideally fitted to serve on streets of light traffic, as extensions of street railways in unserved districts and as an attractive alternative to the basic agencies where competition is feasible. But too constricted a view of their proper sphere may be taken. In an increasing number of cities with populations of 50,000 and more electric lines have yielded completely to buses, and the latter have proved an adequate substitute. In London, conspicuously, the bulk of the short distance traffic is carried by 5000 double deck buses at fares ranging upward from one penny and at speeds surpassing the surface railways. In Paris too an extensive and effective bus system has developed. But where, as is generally true on the continent of Europe, individual enterprise in transportation is sharply restricted by public authority and the spheres of the several agencies are predetermined according to a central plan rather than by trial and error, buses have not threatened the supremacy of the tramway.

Intercity bus operations are of greater importance. For light traffic they are much cheaper than the steam train; and for most short routes the convenience of their terminals and stopping places compensates for the greater station to station speed of the railroad. For longer journeys the bus is slow; but the practise, unlike that of the railways, of charging less per passenger mile as the journey lengthens, combined perhaps with other appealing features, is drawing a small but growing traffic. England with its myriad neighboring towns served, if at all, by rail stations inconveniently remote and with its tradition of free enterprise, has offered the ideal field for exploitation; only the frequency and cheapness of rail service, made possible by the

density of the population, have saved the railroads from disastrous losses. Sight seeing tours, usually seasonal and varying in duration from a few hours to several days, have developed extensively in both Europe and America as a supplement to common carrier bus services; and in the United States the bus has become an important factor in the centralization of the rural school system.

The varied applicability of the motor vehicle is most fully revealed in freight transportation. Over 5,000,000 trucks or lorries are now in use, two thirds of them in the United States. In this country the outlay on motor freight service probably approaches the freight revenue of the railroads, although the ton mileage produced, with both urban and intercity operations included, is perhaps not over one twentieth as great. In the vast local movement of raw products and merchandise to and from factory, farm, store, warehouse, steamship pier and railway station the truck has found its least disputed and most distinctive place. Except when much stopping and waiting are necessary or when, as is often the case in agriculture, hauling is done while facilities and labor are temporarily free, the employment of horses on road or street is seldom economical; even then the resulting increase in traffic congestion discourages their use.

The motor truck has widened appreciably the range of local transportation and has thus penetrated the intercity field sufficiently to threaten the railroad. The position of the latter is secure enough in effecting mass commodity movements; and since trucking costs do not taper with distance or vary with the value of freight in nearly the same degree as railway rates, motor competition is limited largely to short hauls and high class commodities. But even if relative costs only are considered, the economic sphere of trucking may not be defined simply. The extra packing often required for rail shipments and the cartage at terminals are factors of highly variable magnitude; whereas the ton mile cost of trucking may be high or low, depending upon the size of vehicle and the average proportion of capacity utilized. Timeliness of arrival at destination or some other refinement of service accounts in numerous instances for the use of trucks, especially on hauls exceeding one hundred miles, although cheapness sometimes motivates their employment even for very long distances. While the passenger business of American railways declined by almost one half between 1920 and 1930, aggregate freight sta-

tistics scarcely reflected the presence of motor competition. The rather common view of such competition—that railroads are benefited by the loss of short distance, less-than-carload traffic—is acceptable only if rail carriers are relieved of their responsibility toward such traffic. It is for such shipments, if any, that the truck is an adequate substitute for the railroad in the United States; but with a very small percentage of all freight appearing in consignments of under five tons and with an average haul exceeding three hundred miles, the range of substitution is not large. In Great Britain, on the contrary, with hauls averaging less than one fourth of the distance and with an average carload, minerals included, not exceeding the capacity of a large truck, an extremely damaging competition might seem inevitable. Yet so effective is the service of fast scheduled freight trains, and so prompt and economical is the railway collection and delivery service, that only certain relatively large merchandise shipments making full truckloads move by highway.

In undeveloped regions, because the railroad is a costly means of opening new territory, the motor truck is best adapted for long distance operation. Using trucks equipped for both freight and passengers the South African railways have demonstrated their effectiveness under primitive highway conditions, as an alternative to branch line construction. But the exploitation of vast areas in Africa and elsewhere requires a vehicle which will carry bulky goods several hundred miles over poor roads at a cost acceptable to world markets; to this problem engineers have turned their serious attention.

The flexibility which characterizes the functioning of motor transport distinguishes its organization as an industry. Not only is the private vehicle the principal means of passenger transport, but also three fourths of all freight vehicles are in private use. Commercial trucking commonly makes fuller employment of labor and equipment but renders a less prompt and particularized service which is devoid of advertising value. Of the two forms of commercial trucking, the common carrier freight line achieves, with balanced loading, the lowest net ton mile cost; but the contract hauler, usually carrying but one consignment at a time, often reduces greatly the packing and handling otherwise required and sometimes, as through the comprehensive organization of certain American furniture movers, attains a high proportion of revenue mileage. For reasons already suggested motor freight

lines are not conspicuous in Great Britain, although the London area enjoys the finest motor express service in the world. Commercial motor transport, both freight and passenger, has usually been inaugurated on a small scale, often with a single truck or bus; but with success has come the growth of individual concerns and the combination of companies. The spur of competition and the requirements of long distance service have promoted this tendency. With it there have been marked improvements in operation, not so much because of large scale operating economies as because of the attraction of better business ability and the establishment of sounder financial structures.

Steam and electric railway companies have begun to participate extensively in road transport. In conformity with traditional policy France, Germany and other continental countries have sought to bring motor common carrier services under railway control. The British Parliament in 1928 authorized the railways to engage in intercity road operations, in consequence of which they have purchased a controlling interest in many of the larger bus companies. Participation by railways in both truck and bus services is proceeding rapidly in the United States as well. The purposes are various. Sometimes an extension of tributary territory is sought; sometimes the objective is the elimination of unprofitable trains or the closing of branch lines. Main lines may be paralleled with a view to expediting both through and local traffic. In terminal areas trucks are used for interline transfers, for reaching off track stations, for consolidating shipments to specific points and for handling standardized freight containers. It is true that the railways have begun the collection and delivery of freight; but were they to assume full responsibility for these processes, important economies and improvements of service would undoubtedly result. The established practise in the United States is difficult to change. In countries where railways already perform the cartage function, extensive coordination of rail and motor services is a less revolutionary venture. In no other department of transportation is close cooperation of agencies as essential as in urban passenger service; here the electric railways frequently control the buses and in a number of cities they have set up a hybrid form, the trackless trolley. Such participation of rail interests in motor transport is generally explained in terms of better service and lower cost, but doubtless the basic reason

is usually the hope of reducing the force of competition. Whatever the object sought, the method is commonly to provide road services through subsidiaries or by contract rather than through direct operation.

The earliest forerunners of the automobile met legislative discouragement. Collective interest in the present phase of motor transport has assumed a variety of manifestations. The roadway used is publicly provided and specially improved for motor traffic; the problem of safeguarding human lives is a pressing one; vested interests of existing transport agencies and of communities dependent upon them are threatened; and public interference is facilitated by the tradition of transport regulation, quite apart from specific reasons for its initiation in this instance. Public policy in developing highways and in apportioning their cost undoubtedly modifies the industry's growth; but the special license fees and fuel taxes, now almost everywhere imposed, go far—although not equally far in all countries and regions—to refute the view that motor transport is being promoted at public expense to the prejudice of other agencies. On the whole there is no generally accepted view of the highway function. Traffic is usually controlled in order to expedite movement, preserve roads and reduce accidents; in the case of common carriers special standards are established for both vehicles and operators and liability insurance is often required. Only the details of such control appear to be debatable.

But when regulation is grounded in the conception of motor transport as a public service industry, there are notable departures, in both purpose and justification, from traditional policy. Rates and fares have been neither high nor discriminatory in sufficient degree to arouse concern, and control of charges rarely exceeds the requirement that they be published and followed. Of chief significance is the provision that proposed services be inaugurated only when the public need for them has been amply demonstrated. The characteristics which tend to render railway operations monopolistic are almost wholly lacking in motor transport; the new industry has suffered, on the contrary, from the marked ease with which persons with slight capital and business experience may enter it, and restrictions upon entrance are designed to contribute to the orderliness and dependability of service. Control of this nature rests primarily upon the conviction that the relationship of motor service to other transport facilities should

be publicly adjusted. Small reductions in railroad patronage often create losses; and when the continuance of specific rail services is at stake, choice between agencies must be made on broad grounds of public interest. Vital issues are involved. Should motor transport be granted a coordinate place in the transportation scheme or be made an auxiliary to fill in gaps? How may stability be furthered without checking progress? Is monopoly desirable, either in motor transport alone or in all agencies combined? When should rail service be discontinued, and when, if ever, should unprofitable operations be subsidized? Answers to these questions are being sought, but regulation is everywhere impeded by administrative difficulties and by the largely private character of motor transport. In Great Britain local jurisdictional limitations must be overcome, and in the United States interstate motor operations continue free of control in the absence of congressional action.

An interesting speculation concerns the place which motor transportation would occupy today in the industrial and social pattern had it developed contemporaneously with the railroad. A field for investigation along these lines is provided by the undeveloped regions of Africa, Australia and South America, where the effectiveness of the motor car as a pioneering agency is being demonstrated. In older lands existing arrangements have not been fundamentally altered by the new agency, although there have been noteworthy changes. Agriculture has become more diversified, particularly near large markets, and some new land has been opened to profitable use. Increased facility in replenishing stocks and therefore the reduction of inventories have resulted in the saving of capital by manufacturers and distributors. This is in part due to improved rail service, but this in turn has been stimulated by motor competition. Many rural retail centers have declined, while cities are spreading out and a more rounded suburban development is under way. Motor transport must be credited with a nicer articulation of the parts of the current economic machine and an appreciable broadening of the field within which human desires may be satisfied.

MOTT, LUCRETIA (Coffin) (1793-1880), American reformer and feminist. Lucretia Mott, the daughter of a Nantucket ship captain, entered by birth, choice and marriage into the religious and social traditions of the Society of Friends, the inspiration of her lifelong efforts for the abolition of slavery, for women's rights and for peace. At sixteen she became a teacher in a Friends' school and observing that the salaries of the women were half those of the men, although boy and girl students paid the same tuition fee, she remarked, "I early resolved to claim for myself all that an impartial Creator had bestowed." At eighteen she married a fellow teacher, James Mott. Their subsequent life was spent and their family raised in and about Philadelphia, where Lucretia ran a small shop at one time and a school at another, all the while serving as a minister to the Society of Friends. Her ardent espousal of abolition, which led her husband to give up a thriving business because it dealt with cotton, a product of slave labor, aroused considerable antagonism even among the Quakers and once brought a threatening mob to her door. In 1840 she and her husband

were sent to London to attend the World's Anti-Slavery Convention, but Lucretia was barred from active participation because of her sex, as was Elizabeth Cady Stanton, another American delegate. This experience and the meeting of the two women stirred their interest in the dawning field of women's rights. Both were among the organizers of the convention called at Seneca Falls in 1848 "to discuss the social, civil and religious condition and rights of women." In her *Discourse on Woman* delivered the following year Lucretia Mott declared that woman's "right to the elective franchise . . . should be yielded to her, whether she exercise that right or not." In 1870 she became president of the Pennsylvania Peace Society. Her letters reflect a gentle but spirited woman, one devoted to her family and to the home at whose hospitable board Negro guests mingled with white, one impelled at all times to speak out dauntlessly on behalf of "the millions of slaves . . . the greatest sufferers, the most oppressed class."

MOUNT STEPHEN, FIRST BARON, GEORGE STEPHEN (1829-1921), Canadian capitalist. The son of a Scottish carpenter, he attended parish school and worked as a herd boy during the summer. From 1843 to 1847 he was apprenticed to an Aberdeen draper and in 1850 after living for a time in Glasgow and London went to Montreal and entered a cousin's mercantile firm. Ten years later he acquired control of the firm, which had thrived as a result of the expansion of Upper Canada following the construction of railroads, and engaged in the woolen industry and the manufacture of textiles at Almonte, Sherbrooke and Cornwall. His shift from trade to industry and especially his increasing interest in cotton apparently led him to a protectionist attitude by 1872.

His success in textile trade and manufacture brought him in touch with financial and political circles. He became a director of the Bank of Montreal in 1873 and its president in 1876. Western interests acquired through his cousin D. A. Smith (Lord Strathcona) turned his attention to railroads. He was one of a group which bought and profited substantially from the St. Paul and Pacific Railway and established connections with important capital markets in New

York and Holland. In 1880 he became president of the Canadian Pacific Railway and in 1881 resigned his bank presidency. His control of capital and strong political, financial and technical alliances enabled him to complete the Canadian Pacific Railway in a remarkably short period without resort to extensive bond issues.

He resigned from the presidency of the railway in 1888 and retired to England. Although he continued to exercise considerable influence on the policy of the Great Northern and the Canadian Pacific, his main interest henceforth was medical philanthropy. Mount Stephen's business activities played a leading role in linking Montreal's metropolitan growth with the development of ocean steamship navigation to the city and railroad expansion to the Pacific.

MOUNTAIN WHITES. *See* ISOLATION

MU'AWIYAH (c. 605-80), Arab caliph and founder of the Ommyad dynasty. Mu'awiyah, who belonged to the tribe of Mohammed, began his political career as governor of the province of Syria. In 660 with the aid of his Christian Syrian subjects he succeeded in wresting the caliphate from its rightful occupant, 'Ali. He reorganized the government on a Byzantine basis and became the second founder of the Arab state. Although not a soldier he was a great military organizer and rid the military machine of its archaic tribal formation. His generals extended Moslem territory eastward to the Indus and beyond the Oxus into Turkestan and westward to modern Tunis, where Kairwan (al-Qayrawān) was founded in 670. Against the Byzantine Empire he pressed hostilities by land and sea; in 669 and from 674 to 680 he laid siege to Constantinople. His fleet, the first in Islam after the Egyptian, was built on the Byzantine model in the old dockyards of

Acre; it conquered Cyprus in 649 and ravaged Rhodes and Crete.

Mu'awiyah was the first caliph to institute a bureau of registry and a postal service. Shortly before his death he nominated as his successor Yazid, his son by the Christian Maysūn, thus introducing the hereditary principle into the caliphate. Although his critics, mostly Alides or Abbassides, impugn his piety and accuse him of having secularized the caliphate and changed its character from that of a theocratic office to that of a temporal sovereignty (*mulk*), all his biographers consider that his supreme virtue was *hilm*, the use of non-violent methods save when force was absolutely necessary. An opportunist with a highly developed sense of political finesse, Mu'awiyah has been justly considered one of the four political geniuses of Islam and has lived in tradition as the model Arab sovereign.

MULCASTER, RICHARD (1531?-1611), English educator. Mulcaster's writings are concerned primarily with the daily business of a schoolmaster and the philosophy which should direct it. As the first head master of the Merchant Taylors' School (1561-68) and as high master of St. Paul's (1596-1608)—and no doubt also in the ecclesiastical appointments which he enjoyed—he proved his theories and principles. His *Positions* (1581) and his *Elementarie* (1582) are landmarks in the history of English education. He wrote in English, claiming for his native language a subtlety equal to that of Greek and a range not less than that of Latin. He argued in favor of a general elementary education for all children and paid great attention to the teaching of the youngest, holding that they required the most skilful and accomplished masters. But the simplest foundations once laid, a higher education was to be reserved for pupils, boys and girls alike, really capable of receiving it. The best wits were to be best cultivated. Of the best there were sure to be enough for the needs of society. Learning bestowed on persons unfit for it would make them injurious to the body politic. He adopted Plato's doctrine that

education has its goal in the service and maintenance of the state. He insisted upon judicious and systematic physical education. His pupils were taught to sing and to act. Perhaps he is most memorable for his demand that, since teaching is an art, those who are to practise it should learn it; teachers must be trained.

MÜLLER, ADAM HEINRICH (1779-1829), German political and social philosopher. Müller was born in Berlin of a Protestant Prussian family but embraced Catholicism in 1805. He entered the service of the Austrian government in 1813 and was consul general in Leipzig from 1818 to 1827. He acted as a political observer for Metternich both in Leipzig and at subsequent international congresses.

Müller was one of the founders and leading representatives of German romanticism. He was largely influenced by the ideas of Burke and his views also resemble closely those of Bonald. His theories centered chiefly around the categories of "opposition" and "mediation," "community" and "organism," and were directed against the rationalistic philosophy of the Enlightenment. Müller opposed the principle of liberalism with that of authority, progress with the value of tradition, the idea of individual liberty with the principle of the binding ties of the organic community, the idea of revolution with that of the restoration, in the spirit of a transfigured mediaevalism, of a universal, corporate, Christian and authoritarian order of society. Christianity, church, nation and state are the great collectivities in which the individual first becomes conscious of his own personality. The highest realization of community life is the national state, which stands for the totality of human affairs, an "eternal alliance" not only of contemporaries but of all past and future generations. Its chief function is to integrate all physical and spiritual elements and to mediate between the nobility, which represents the

plantlike, feminine and conservative principle in society, and the bourgeoisie, which represents the animal, masculine and republican principle. The ideal form of government is therefore the mediaeval corporate state in which the various functional groups (*Stände*) are the members of the state organism.

Müller's economic views are directed against the rationalist and individualist economic doctrines of Adam Smith. They constitute an elaborate attempt to "spiritualize" the basic doctrines of classical political economy and to introduce into economic considerations all non-material and spiritual values. The essential principle of money, for example, says Müller, is not its physical value but its spiritual function as an intermediary and as a measure of the importance of objects for society. Capital symbolizes the significance of the past for the present and future. The wealth of a nation consists, in addition to the physical elements, of the spiritual capital of ideas and scientific experience.

Müller's political and social doctrines provided the spiritual foundations for political conservatism and nationalism, particularly Prussian agrarian conservatism, as well as for the organismic socialism of Rodbertus and Marlo. The socialists of the chair and the Christian Socialists of both faiths, particularly the Social Catholics of the nineteenth century, have been greatly influenced by Müller's writings. Othmar Spann has constructed his universalist political and social system on the basis of Müller's ideas. All opposition in Germany to liberalism and capitalism, to democracy and republic, to cosmopolitanism and humanity, may be traced to Adam Müller. He is the spiritual ancestor of the ideology, although not of the methods, of National Socialism.

MÜLLER, FRIEDRICH MAX (1823-1900), Anglo-German orientalist and philologist. Max Müller was born in Dessau, Germany, the son of the poet Wilhelm Müller. He studied at the universities of Leipzig and Berlin and was influenced particularly by the comparative philologist Franz Bopp and the romanticist philosopher Schelling. In 1845 he visited Paris, where he became acquainted with the work of Eugène Burnouf, the foremost Zend scholar of the time. He went to England in the following year and in 1848 settled permanently in Oxford, becoming full professor in 1854.

Müller's writings covered the wide fields of comparative religion, comparative mythology and comparative languages. His method was based on the essentially romantic identification of thought and language. Müller held that all thought finds its last consummation in language, hence the "growth of the human mind must be studied in the history of language." His investigations into religion and mythology were thus of a more metaphysical character and showed little trace of the influence of the newer anthropological and ethnographic currents. Most of his theories, such as those of the origin of myth in "diseased language" and of the origin of religion in the recognition by man of the "infinite cause," have since been successfully disproved. But no writer during the nineteenth century has contributed as much as Müller toward the popularization of the study and problems of comparative religion and toward arousing the interests of a wide reading public in the subject. His critical edition of the *Rigveda* with the Sāyana commentary (6 vols., London 1849-73; 2nd. ed., 4 vols., 1890-92), his most lasting contribution to learning, and his edition of the *Sacred Books of the East* (49 vols. and Index, Oxford 1879-1910) have been more effective than any other works in placing

the study of comparative religion on a sound basis.

Max Müller is chiefly responsible also for the wide vogue of the theory of Aryanism. It was he who coined the word Aryan to replace the more cumbersome term Indo-Germanic. Although he categorically denied the identification of language and race and held that "it would be as wrong to speak of Aryan blood as of dolicocephalic grammar," his writings are full of such expressions as Aryan race, Aryan ancestors and Aryan peoples. The wide circulation of his writings and the scholarly prestige attached to his name helped to pave the way for the elaboration and acceptance of the Aryan racial theory which became so prominent in the literature of the late nineteenth and the early twentieth century.

MÜLLER, JOHANNES VON (1752-1809), Swiss historian. Müller studied at Göttingen under Schlözer and thereafter served as librarian and historiographer in the governments of Hesse-Cassel, Mainz, Austria, Brandenburg and Westphalia. Fanciful and sentimental, he became enthusiastic over all current ideas, changing his views so often as to lay himself open to the reproach of weakness of character. He never developed an independent philosophical or methodical criticism.

Although late in life he attacked Rousseau, the latter's idea of freedom and his cultural pessimism are basic to Müller's historical approach. Müller fancied himself in the role of Tacitus, whose style he imitated. Convinced that Europe was facing ruin because of the destruction of

the balance of power, he feared an era of despotism in which all noble impulses would find expression only in utopian form. He believed that culture would decay in Europe and soon be transplanted to America. He sought to stimulate in his countrymen a consciousness of former political and intellectual glories, idealizing mediaeval purity of morals and civic virtue, especially as reflected in the old aristocratic Bernese constitution, in contrast to modern intrigue and violence. This return to the archaic he tried to combine with admiration for the principles of equality. Affected by a religious Pietistic revival in 1782, Müller began to view world history as the expression of divine ordinance—all motives, crises and men of might are of divine origin and holy; they must be honored and not opposed. Consequently under the influence of the rising Napoleonic power Müller abandoned his predilection for the Prussian state and became an admirer of Napoleon, the "scourge of God."

Despite his Enlightenment philanthropism Müller ranks with Rousseau, Herder and Justus Möser as an inspirer of the romantic view of history. He first revived the language of the old chronicles and disclosed the aesthetic charm of the antique, of local color. He paved the way for the cult of the Middle Ages, especially through his admiration for the paternalism of the Catholic church. Like Gibbon he helped to spread the enthusiasm for Switzerland in Europe and he gave to rising German nationalism its patriarchal, democratic tendency. Müller planned but never completed a universal history. Forty-three volumes of notes for this, now in the municipal library in Schaffhausen, his birthplace, entitle him to be regarded as the precursor of Leopold von Ranke, whom, moreover, he influenced by the religious basis of his historical philosophy. The monumental character of his work placed him, in the eyes of his contemporaries, in the same rank with such classic historians as Livy and Polybius.

MÜLLER, KARL OTFRIED (1797-1840), German classical historian. Müller was born in Silesia and studied first at Breslau and then at Berlin, where he came under the influence of Böckh and Buttmann. In 1819 he became professor at the University of Göttingen, a post which he retained until his death.

Müller's importance in the development of modern historiography lies chiefly in his wide use of mythology for the reconstruction of the earliest periods of classical antiquity. He was an adherent of the politico-romantic school of historians, who looked upon historical development as an organic unfolding of national life. Müller aimed to write a general history of the Greeks based on materials from mythology, history, art, politics, literature and religion, in which he planned to trace the development from the earliest migrations down to the era of Alexander the Great. His ambition was never realized, however, and the work survives only in fragmentary form.

Müller's first work, *Aegineticorum Liber* (Berlin 1817), in which he set forth the history of Aegina from the mythical period to the Middle Ages, already revealed his interest in and use of mythology as well as of natural topography. He continued his investigations in his *Orchomenos und die Minyer* (Breslau 1820) and *Die Dorier* (2 vols., Breslau 1824; tr. by H. Tufnell and G. C. Lewis, Oxford 1830), which formed the first three volumes of a projected history of Hellenic races and cities (2nd ed. by F. W. Schneidewin, Breslau 1844). He drew a picture of the strength, dignity, persistence and disciplined solidarity of the Dorians and attempted to show that their political organization was not the work of a single creator but rather an out-

growth of innate national energies and unbroken tradition. This study aroused particular opposition because of his underestimation of the Ionian contributions to Greek civilization. In his *Die Etrusker* (2 vols., Breslau 1828; new ed. by W. Deecke, Stuttgart 1877) Müller applied his method to the veiled subject of Etruscan life. He answered his critics and justified his use of mythology in his *Prolegomena zu einer wissenschaftlichen Mythologie* (Göttingen 1825, new ed. by W. Deecke, Stuttgart 1877; tr. by John Leitch, London 1844). With his *Handbuch der Archäologie der Kunst* (Breslau 1830, 3rd ed. by F. Welcker 1848; tr. by J. Leitch, London 1852), in which he made use of all the materials on Greek art and literature gathered in the museums, he laid the foundations for a new branch of study which has since enormously enriched contemporary understanding of ancient civilization. His scattered essays and smaller works have been collected in *Kleine deutsche Schriften*, edited by Eduard Müller (2 vols., Breslau 1847-48), and in *Kunstarchaeologische Werke* (Calvarys philologische und archacologische Bibliothek, vols. viii-xii, 5 vols., Berlin 1873).

(vol. i 4th ed., vols ii-iii 2nd ed. Berlin 1886-95) vol. ii, ch. xvi; Gooch G. P., *History and Historians in the Nineteenth Century* (2nd ed. London 1913) p. 35-40.

MÜLLER-LYER, FRANZ CARL (1857-1916), German psychologist and sociologist. Müller-Lyer studied medicine in Strasbourg, Bonn and Leipsic. In 1881 he became assistant physician in the Strasbourg psychiatric clinic. His first researches were concerned with physiological and experimental psychology, and for this purpose he studied in the laboratory of Du Bois-Reymond and Charcot. In 1888 he moved to Munich. His last study in individual psychology was *Vereinfachte Harmonik, auf Grundlage eines natürlichen Harmoniesystems* (Regensburg 1894); he then undertook a large, systematic work in the field of sociology, of which seven volumes appeared.

In his sociological work he merged the social evolutionism of nineteenth century sociologists and the historical materialism of Marx. By his "phraseological method" of research he distinguished, described and correlated general successive culture stages through which human societies had passed. His classifications were

built around social economy, systems of government and the intellectual life; social economy was emphasized as the most fundamental in that every great epoch was ushered in by the extension of natural resources, by technical inventions or by new forms of labor organization. He recognized that each of the separate peoples of the world, living under diverse conditions of nature, possesses a history of development that does not exactly coincide with that of any other; he contended, however, that in spite of these differences a universal system of stages may be arranged if local peculiarities are ignored, that everywhere culture has advanced not haphazardly but according to regular laws and in a fixed direction—in general from simple to complex, from homogeneous to heterogeneous, from concrete to abstract. A system of stages he regarded as a scientific necessity to give a requisite setting for the studying of local differences, to permit analysis of the direction of cultural change and to make possible programs to control its future development. He pointed out that not all aspects of culture advanced at the same rate; he stressed particularly the fact that the development of social organization did not keep pace with the rapid advance of technical art and economic life, with the result that proletarianism and pauperism persisted in spite of the fact that material resources were available to eliminate them. Keenly sensitive to the economic exploitation of the masses under capitalism, he attributed to inheritance and the transmission of property within the family the increasing disparity between the classes. He regarded "anarchy of production" of individual competing units as inherent in capitalism. The periodic economic crises of capitalism he ascribed to underconsumption; this was due to insufficient buying power of the workers resulting from their low wage levels. He believed that the solution of the problem required the complete centralization and organization of production in such a way as to bring it into equilibrium with consumption, that this should be effected gradually by the pressure of workers' associations rather than by revolution, that capitalism would give way to socialism and that in time the state would give way to independent associations of workers who would maintain themselves in perfect equipoise in ideal anarchy.

His writings, which have been printed in editions of 75,000 copies, have been popular among the monists, freethinkers' societies and ethical culture societies and among many workers'

groups and have been translated into many languages.

MUN, ALBERT DE (1841-1914), French politician. A descendant of old nobility, de Mun became interested in social reform after serving in the colonial forces, in the war of 1870 and in the suppression of the Commune. He became associated with Maurice Maigren, a militant Catholic, who had founded in Paris the Cercle Montparnasse, a working men's club. De Mun established a national organization, the Oeuvre des Cercles Catholiques d'Ouvriers, and from 1871 to 1875 devoted his remarkable oratorical powers to a nation wide campaign, attacking the principles of 1789 and preaching "counter-revolution through the syllabus." He advocated restoration of the legitimist pretender Henry V and the reestablishment of Christian guilds to organize workers under the leadership of the upper classes. Elected deputy in 1876, he upheld these ideas before the Chamber but was led to moderate his views by the defeat of the Boulangist movement, which he had ardently supported, and by the influence of Pope Leo XIII. He accepted the republic and while continuing to attack the laissez faire school used his influence in support of laws favorable to the working classes. He warmly applauded the encyclical *Rerum novarum*. Since the Oeuvre had failed because few workers would accept upper class leadership, he inspired a new organization of educated youth, the Association Catholique de la Jeunesse Française. He was accused by some Catholics of having become a socialist, but he won the approval of Leo XIII and regained intransigent sympathies by the ardor which he displayed against Dreyfus. It was de Mun who demanded the prosecution of Zola. He was a tireless opponent of the Waldeck-Rousseau and

Combes ministries in their attacks on the Catholic school system and monasteries. In his last years illness prevented him from speaking in public and he occupied himself with the publication of his works. He frequently contributed articles to the social Catholic review, *Association catholique*, and to various newspapers. During the World War he advocated national unity against Germany.

MUN, THOMAS (1571-1641), English mercantilist. Mun, a wealthy merchant, was a director of the East India Company, which was a target for criticism in England because it exported bullion and imported East India goods exceeding in value its exports of English wares. In defense of the company he wrote two books which had great influence on subsequent thought and made him the foremost English exponent of mercantilism. In his first book, *A Discourse of Trade, from England into the East-Indies* (1st and 2nd ed. London 1621; reprinted New York 1930), he accepted the current bullionist doctrines. He maintained, however, that the East India trade was profitable to England because it brought into England necessary and useful commodities which could be purchased elsewhere only at a higher cost; and because a large proportion of these goods were reexported at a profit, so that the net result was an inflow instead of an outflow of bullion. The evils from which England was suffering he attributed not to the East India trade but to manipulation of their currencies by foreign countries, abuse of the foreign exchanges by moneyed men, failure to enforce the Statutes of Employment and excessive consumption of foreign wares. Malynes, the foremost exponent of the bullionist doctrines, attacked this book, but Misselden came to its defense along lines which anticipated Mun's subsequent position. In his second and more important book, *England's Treasure by Forraign Trade, or, the Ballance of our Forraign Trade Is the Rule of our Treasure*, written about 1630 but

first published after his death by his son (London 1664; reprinted Oxford 1928), Mun broke definitely with the bullionist theories and criticized severely Malynes' doctrines with respect to the evils resulting from the alleged manipulation of the exchanges by private dealers. While convinced that the object of commercial policy must be to augment the national stock of bullion, he urged that all bullionist measures which sought this end through interference with the individual transactions of merchants and prohibition of the export of bullion were bound in practise to prove both costly and ineffective. Repeating the already familiar argument that only by an excess of total exports over total imports could a country without gold or silver mines augment its stock of bullion, he recommended as the most promising means toward this end the domestic production of commodities hitherto imported, sumptuary laws to restrain the consumption of foreign luxuries, the exaction of high prices for English commodities for which there was no alternative source of supply, the promotion of English shipping and fisheries, the fostering of the entrepôt trade, moderation of the duties on exports and heavy duties on imports destined for home consumption. He pointed out clearly that non-commodity items affect the direction and amount of the balance of trade payable in bullion, and here perhaps lies his one real claim to originality of analysis. As items to be added to or subtracted from the statistics of commodity trade in computing the total balance he specifically listed earnings from shipping, fisheries and insurance, remittances to Rome, travelers' expenses, foreign merchants' commissions and goods included in the statistics but lost at sea. There are also to be found in this book an embryonic quantity theory of money, the germs of a theory of value and some sensible remarks about public finance; his analysis of the shifting of the excise led him to the opinion, which thereafter enjoyed considerable currency, that the masses of consumers were virtually immune to the burden of taxation.

MUNCH, PETER ANDREAS (1810-63), Norwegian historian and philologist. Together with Rudolf Keyser, Munch laid the foundations of

the Norwegian historical school. He did pioneering research in runology, mythology, archaeology, textual criticism and old Norwegian as well as in Norwegian history. He cooperated in the publication of the old Norwegian laws, runic inscriptions, mediaeval diplomas and a great number of manuscripts. Munch was moreover the first to utilize the rich treasures of mediaeval northern history buried in the archives of the Vatican. His work was inspired by a strong sense of Norwegian nationalism, and his view of history plainly bore the stamp of the national romantic period in which he lived. Munch held that Norway had a very old history of its own. The Norwegians had always been a separate people; they had wandered into the country by their own ways and not together with the Danes and the Swedes; the ancient literature of the Eddas and the sagas was not a literature common to all the northern peoples but a distinctly Norwegian-Icelandic product. The Norwegian people thus became the hero of his work, and the age of the sagas and the age of independence came to stand as the noontide of glory in Norwegian history.

MUNDELLA, ANTHONY JOIN (1825-97), English social reformer. Mundella, the son of an Italian political refugee, showed at an early age considerable aptitude for business and at the age of twenty-three had become by his own efforts partner in a hosiery firm at Nottingham. He first rose to eminence by his success in settling a serious strike in the hosiery trade, which had long been disturbed by industrial disputes. Using the settlement as a basis for a more permanent understanding he secured in 1860 the formation of a joint board—the first successful board of its kind in England—consisting of

representatives of employers and workmen in equal numbers, which met periodically. There was no impartial arbitrator but simply a chairman to preserve order. The business before the board was largely of a trivial character, but it taught the habit of peaceful negotiation. The scheme had remarkable success, and Mundella subsequently occupied himself for some years in stimulating the adoption of similar devices elsewhere. From 1868 until his death he represented Sheffield in Parliament, where he led the movement for giving trade unionism a legal status and advocated popular education and social reform in general. He held ministerial office in the later Gladstone cabinets first as vice president of the Council of Education and later as president of the Board of Trade.

The industrial conciliation board has not proved a panacea, as Mundella evidently expected, but it has done good work in reducing personal misunderstanding. Before Mundella's day the typical attitude of employer to trade unionist was that of magistrate to prisoner; Mundella at least imported some "mutual courtesy." But he was a little blind to the economic difficulties which underlie industrial conflict and which cannot be removed simply by good feeling and tact.

MUNICIPAL CORPORATION. A municipal corporation is a body politic, created by the incorporation of the people of a prescribed locality and invested with subordinate powers of legislation, for the purpose of assisting in the civil government of the state and of regulating and administering its local and internal affairs. Under the corporate name it has continuous legal identity regardless of changes in its membership. In the United States municipal corporations differ from private corporations in sev-

eral important particulars. Private corporations are created only with the assent of their incorporators; their charters and contract rights are the private property of the stockholders and are protected by the federal constitution against impairment by the legislative power of the state. Municipal corporations, on the other hand, are regarded as purely political institutions created by the legislative power without the necessary consent of the inhabitants. As agencies of the state they are endowed with important governmental powers, but all their powers, rights and privileges are conferred upon them as trustees for the public welfare and are subject to the legislative power of the state, within the limits of the state constitution. Within the sphere assured to them by their charters, however, they are independent corporate entities. The scope of their functions is often broader than that of the state government, and the rules and regulations enacted by them affect the life of the citizen far more directly than do those of the federal government.

It is in the Roman law that the source of the idea of corporate entity is to be found. While the concept of the state, endowed with a corporate life independent of the lives of the individual citizens, may be traced to early historical times, it was not until the rise of the Roman *municipium* that the idea of corporate status, already developed in private law, was carried over to promote the administration of subordinate municipalities. The Roman genius for organization attributed a juristic entity to subject cities in order to centralize the responsibility of their inhabitants to the state and to assure their continuous corporate existence. The existence of the *municipium* required the sanction of the state, but a certain sphere of independent action was assured to the freemen of the city. Within prescribed limits the *municipium* regulated its local affairs; it was responsible for obligations and delicts of its agents; it could acquire property by purchase and by gift if not by devise.

The chaotic conditions following the fall of the empire made impossible any local political autonomy, but with the advent of a more stable social and political order toward the end of the tenth century the municipal corporation reappeared as a governmental institution, aided by the revival of Roman law concepts. The success of the continuous struggle of the cities for independence and of the smaller towns and rural areas for some degree of local autonomy varied as the forces of feudalism and of monarchy

gained ascendancy from time to time. The theory of corporate independence persisted wherever the localities were able to establish their authority. This is manifest in the rise of the free cities of Italy and of Germany, in the struggle of the towns and *hermandadas* in Spain to maintain their charter privileges (*fueros*) and in the efforts of the communes of northern France to keep their political identity even after the triumph of absolutism.

It is to the democratic forces of the French Revolution, however, that modern local government upon the continent owes its existence. The Constituent Assembly sought to revive the communal liberties, but under the empire the French commune became merely the local administrative unit of the central government. A lasting equilibrium between the prerogatives of the state and the liberties of the localities was not established until 1884. Today local government in France is based upon the 38,000 communes, each with a *maire* and a locally elected council, responsible to the supervisory administrative officers of the *département*. The marked characteristic of the system is that the powers exercised by officers of the communes are regarded as administrative rather than legislative and the ordinances adopted by the communes are not local laws but administrative regulations. All local powers emanate from parliament, which by general statutes fixes their limits and defines the method of their exercise. While extensive powers to levy taxes, to own and manage property and to enact police regulations are conferred upon the communes in general terms, they are subject to strict administrative supervision, with ultimate control vested in the system of administrative courts. Thus the assurance of local self-government in France is political rather than constitutional and the commune as a municipal corporation must be regarded as almost exclusively a local agency of the state.

The development of the modern municipal corporation in Germany is interwoven with the history of the individual states. The rise of the Prussian monarchy in the eighteenth century marked the practical extinction of the municipal corporation as a self-governing autonomous unit. But with the collapse of the Prussian government under the French invasions subsequent to the revolution the necessity of reorganizing municipal institutions became apparent. The Stein-Hardenberg legislation of 1808 and 1810 recreated local self-government in Prussia by establishing a general network of local gov-

ernmental agencies, both urban and rural, each with a popularly elected council (*Gemeinderath*), which chose the *Bürgermeister* and his corps of executive assistants (*Magistratsmitglieder*). This system spread with the growth of Prussia and was adopted in the other states. Municipal corporations in Germany possess very extensive powers of local government. They have the general power not only to undertake the ownership and operation of local utilities but to engage in any activity not expressly forbidden by law or not preempted by the Reich or the state. They are also the ultimate units of an administrative hierarchy which transcends state boundaries and culminates in the Reich itself. The German municipal corporation thus differs from the American not only in its possession of far broader powers conferred by general grant and freely exercised under an efficient administrative supervision but also in the important part it plays as an administrative agent of the central government.

In England by the time of Edward I there were numerous towns and cities organized as boroughs, each with a local judicial and administrative body called the court leet. Certain boroughs had existed before the Conquest, some had been created by the Norman kings, while others held their privileges by the grace of the feudal lords. The customary rights of the boroughs from the time of the Conquest had been generally recognized by the Norman kings. As towns increased in wealth and population, the crown assured to them or to a portion of their inhabitants certain franchises and privileges under the solemn form of charters. They were permitted to collect their own taxes and to enjoy the revenue arising from the franchises and from the administration of their local government. The borough in turn assumed the obligation of making fixed periodical payments (*firma burgi*) in money or in services. The borough community collectively was recognized as a continuing body and subject to penalties for the non-performance of the duties it owed the crown, just as were the local administrative units, the county, the hundred and the rural township.

Beginning with the charter of Kingston upon Hull in 1439, some of the boroughs came to be incorporated in the modern sense; and by the beginning of the sixteenth century the borough corporation was recognized in law as a "Body Politick that endureth in perpetual succession." As in all other corporations whose charters were granted by royal prerogative the consent of the

incorporators was essential to their creation, and their charters were subject to forfeiture for misuser or nonuser of their franchises. They differed from corporations created by Parliament, which are called into existence solely by the will of the legislature and can only be dissolved by an act of that body.

The most marked characteristic of the borough charters was the lack of uniformity in the rights and privileges granted by the crown, in the nature and amount of their *fermes* and in the public duties imposed upon them. On the other hand, they all possessed some measure of local legislative power, limited in most cases to the preservation of their ancient customs, the maintenance of the commercial privileges of their inhabitants and the administration of such property as they might hold. No general power to enact police ordinances existed, although in London and a few of the more important centers such power was exercised with the acquiescence of the crown. By the time of the Commonwealth, however, the boroughs were allowed by law to enact such laws and ordinances for the better government, oversight and correction of the borough or city and the people thereof as to the governing authorities should seem good and proper, "so as they be not repugnant to the laws of the nation nor against the public and common good of the people" within or without their limits. Such local legislative power was seldom expressly granted by charter; it was still incidental to the preservation of the ancient customs assured to the borough by the crown, so that those which enacted bye-laws had to show, in the absence of a grant, express or implied, that such power had been exercised by them from time immemorial. In most boroughs local legislation was in the hands of small, inefficient, self-continuing and self-serving bodies. The inevitable result was a progressive decay of local government in England from the close of the fifteenth century to the time of the Municipal Corporations Act of 1835, which sought to replace the existing chaotic conditions with a uniform system of responsible local government based upon popular suffrage. Following closely the reform of representation in Parliament, this act gave a new life to municipal institutions in England under legislative rather than prerogative sanction. The Municipal Corporations Act of 1882, which is still operative, while not abridging the common law prerogative of the crown, nevertheless prevents its granting charters of incorporation with the powers conferred

by the act save with the advice of the Privy Council and on petition of "the inhabitant householders." Although the theory of prerogative creation is still maintained, nearly all municipal corporations in England are now parliamentary in character.

There are thus two general classes of municipal corporations in England: the boroughs, with some degree of ancient prerogative and customary powers; and other urban and rural authorities created by later legislation, commonly referred to as statutory corporations, with none but strictly enumerated powers. In legal theory the corporate entity in the latter class is conceived to be the governing body rather than all the inhabitants of the prescribed area, as in the borough. Both by general laws and by special statutes Parliament may extend or restrict the powers of all the units of local government. The public health acts, for example, apply to or may be adopted by all urban districts and, in some cases, by rural districts as well. Powers granted by these acts are subject to the control of the Local Government Board and a general administrative supervision is exercised over the financial powers of all the local bodies. This administrative supervision, unlike that in Germany and France, is subject to the control of the ordinary courts. Special statutes often relieve the larger boroughs from the supervision of the central administration by directly authorizing the municipalities to act in a given case without such approval. The enumerated powers thus granted are always strictly construed, and no official act can bind the corporation unless there has been a compliance with the statutory directions. The English system of local government, although it lacks the uniformity of the French system, is much simpler than the American in that the control of Parliament is not restricted by constitutional limitations. The construction of enumerated powers follows rules similar to those applied in the United States, but the general use of administrative control over the exercise of the delegated powers renders the system more adaptable to different local requirements.

The English colonists in America carried with them the common law and their local institutions. The towns set up in New England and parts of New York were from the first not only subordinate agencies of the colonial administration but also local self-governing units exercising delegated powers with a quasi-corporate status. In legal contemplation they were public corporations created by the state; their charter rights

were not the result of contract but were held and administered in trust for the benefit of their inhabitants and of the general public. In Massachusetts, Connecticut and Rhode Island the colonial legislature assumed itself to be the source of the existence of these public corporations and jealously prescribed the methods they should follow in exercising the powers conferred upon them.

In the southern colonies the subordinate unit for general governmental purposes was the county, upon which were charged most of the duties of a general governmental nature which in New England were imposed upon the towns. These larger involuntary governmental units served admirably the purpose of their creation, but because of their large area and sparse population they were neither called upon nor fitted to exercise local governmental powers. For ecclesiastical and minor administrative purposes they were divided into loosely organized territorial divisions called townships or parishes. Indeed local government of a kind even approximating that which prevailed in New England was practically non-existent elsewhere except on Long Island and in the larger centers of population. The germ of modern American city organization, modeled upon the English borough, is to be found in the central and southern colonies. Upon the development of urban communities in the colonies the royal governors as representatives of the crown made charter grants similar to those made by the crown in England. The commissions of the royal governors usually gave them express power to exercise this prerogative in the colonies. Some twenty of the leading towns outside New England were thus incorporated with property rights and more or less extensive powers of local government. Almost from the beginning the colonial assemblies assumed a relationship to the chartered cities similar to that of Parliament to the boroughs. Numerous instances may be cited of their attempts to confirm the charters granted by the royal governors and even to confirm the powers of the governor himself. Just as an act of Parliament was necessary to confer upon chartered boroughs governmental powers in addition to those established by immemorial custom, so by analogy the colonial legislatures assumed that powers of local taxation, local judicial administration, care of the highways and police regulation lay within their province, and either exercised these powers directly or imposed their administration upon the chartered cities.

After the revolution the state legislatures became the depositories of all legislative power and at once took over the granting of charters of incorporation. For the next fifty years local government outside New England was characterized by a general system of administrative units consisting of counties and towns or parishes, generally denominated as quasi-municipal corporations, with an increasing number of self-governing cities, villages and boroughs organized under special charters and having delegated legislative powers. Such municipalities were usually superimposed upon the administrative units and were concerned primarily with their own local interests, but gradually the legislatures committed to them an increasing burden of administrative duties within their territories. The resulting dual nature of the municipal corporation as at once a subordinate administrative agent of the state and a unit of local self-government became a fixed characteristic of the American system.

The democratic movement in the first part of the nineteenth century promoted decentralization of governmental powers and the multiplication of local self-governing units. While the state legislatures still exercised the plenary charter granting power, the ascendant political theory compelled them to grant or amend the charters as the local governing authorities might dictate. The resulting chaos led many states to adopt constitutional amendments requiring general laws for the granting of charters of municipalities and for the regulation of their internal affairs. Such amendments, however, did not prevent classification of municipalities for purposes of legislation, based either upon population or upon the existing division into cities, villages or towns. The later movement toward the optional adoption of the provisions of general incorporation laws was uniformly upheld, but the evils of unrestrained legislative control became so marked that within the past fifty years many states have adopted constitutional home rule amendments, transferring the charter making power from the state legislature to the electors of the various municipalities. This power is necessarily subject to the constitution and the general laws of the state, so that the domain of constitutional home rule is limited to strictly municipal affairs and must adjust itself largely to the will of the state as expressed in general legislation (*see* HOME RULE).

So frequently have statutes purporting to create municipal corporations violated consti-

tutional inhibitions and so often has the action of the local authorities in complying with statutory requirements for incorporation been found defective, that the courts have been compelled to develop and apply a doctrine of *de facto* municipal corporations, based upon principles analogous to those of *de facto* officers. Briefly stated, the doctrine is that a municipal corporation which is not created *de jure* will nevertheless be regarded as a corporation *de facto*, provided it has been organized under color of legislative authority in good faith and has exercised the franchises as of a *de jure* corporation. If found to be a *de facto* corporation, all of its corporate acts will be held valid and not subject to attack in any collateral proceedings. Moreover, in a direct proceeding by *quo warranto* to test the validity of the incorporation, the courts of many of the states have asserted their discretionary power and have refused to declare a judgment of ouster when the *de facto* status has persisted so long that confusion or injustice might result from the termination of the corporate existence. These doctrines have been largely instrumental in reconciling the conflicting principles of statutory and constitutional construction and have assured the essential stability of the corporate existence of local governmental agencies.

The present organization of municipal government in the typical American state is characterized by the coexistence of two classes of local agencies. In each state the entire territory is divided into districts called counties which in turn are divided into towns. These districts are given a corporate status and elect their own officers but act primarily if not solely as administrative agencies of the state. These so-called quasi-municipal corporations discharge certain state functions, including the maintenance of peace, the administration of justice, the care of the public highways, the collection of taxes, education and the preservation of the public health. Although these functions may be committed in whole or in part also to the municipal corporations within the same area, the latter are primarily self-governing units with delegated powers of local legislation and as such are differentiated from the quasi-municipal corporations. The powers of the municipal corporation are said to be defined by its charter, but except for the metropolitan cities, municipalities are ordinarily organized under general statutes instead of special charters. In the broad sense therefore the charter may be said to consist of all statutes

providing for the creation of the corporation and delimiting its powers, to be construed in the light of other general legislation and subject to the provisions of the state and federal constitutions.

The American municipal corporation from the legal point of view is entirely the creation of the legislative power of the state and can be terminated only by legislative act. It is organized exclusively for public purposes and neither its charter nor any right or privilege granted thereby is protected by the contract clause of the federal constitution. The doctrine of the inherent right of local self-government, always a potent force in American political theory, has been finally discarded as a principle of constitutional law. Except as exercised directly in the state constitution or limited thereby, the state legislature possesses the plenary power to create and dissolve municipal corporations, to enlarge or curtail their powers and to supervise their local activities. Under the home rule amendments this legislative power is vested to some degree in the local electorate, which is given the power of adopting or amending the charter.

Under the American system the powers of a municipal corporation are granted not in general terms but by enumeration. The fundamental principle is that a municipal corporation can exercise no powers except those expressly granted by the state or those implied as necessary to carry out some express power or those indispensable to the declared objects of its incorporation. Unless authority can be found in the state constitution, the general statutes or the instrument or instruments which constitute its charter, the attempted exercise of a power will be *ultra vires* the corporation. Any reasonable doubt of the existence of a power will be resolved by the courts against the corporation. While recent legislation in the several states shows a marked tendency toward extending the scope of local powers, this doctrine is still the fundamental rule of construction. As a corollary to this doctrine certain other principles of construction follow: its powers can be exercised only for municipal purposes, that is, for those objects which the municipal corporation is expressly authorized to undertake; discretionary powers may not be redelegated but must be exercised by the officer or body of officers in whom the duty to perform them has been vested; the method of exercising a municipal power prescribed by the charter is exclusive and no valid act can be effected without complying with the

statutory requirement; a municipality may not by contract limit the exercise of its legislative powers nor of its governmental powers—taxation, police or eminent domain—except as expressly authorized by statute. In addition to these elementary rules the courts apply the general principle of construction that all local legislative powers conferred in general terms are to be reasonably exercised and that the determination of what is reasonable is a judicial question.

The application of these principles may be illustrated by the attitude of the courts toward certain auxiliary powers, such as the power to contract, to incur indebtedness and to levy taxes. The power of a municipal corporation to contract is generally expressly conferred but it may be implied wherever reasonably necessary to the execution of any express power. The contracting power is a discretionary power and must be exercised only by the municipal body upon whom the express or implied power is conferred. Where a statute imposes a positive duty upon a municipality to be executed by a particular officer, he may bind the municipality by contracts necessary to the performance of the duty imposed. If by charter or general statute a method of contracting is attached to the power granted, such method is a limitation upon the power and no valid contract can be made except by the prescribed method. All persons contracting with a municipal corporation are bound at their peril to take notice of the powers to contract of the corporation or of its officers and of the statutory requirements as to method. Where, however, the exercise of the power is only irregular and does not amount to an evasion of a positive statutory requirement, the doctrine of estoppel may be set up; but no estoppel is available against acts *ultra vires* the corporation. All contract obligations of municipal corporations are protected by the contract clause of the federal constitution but the rights acquired by the corporation itself are subject to legislative control.

Unless restricted by the constitution or statutes, a municipality has the implied power to incur indebtedness whenever this is necessary to accomplish an authorized function; but the power to borrow money is not an incident of its corporate existence, nor is it to be implied from any of the ordinary powers conferred by the charter. Where the power to borrow is expressly granted, either generally or for a specified purpose, the power to issue such negotiable evi-

dences of the indebtedness as may be necessary to raise the funds will ordinarily be implied. Constitutional, statutory and charter provisions relating to the manner of exercising the power to incur indebtedness are mandatory, and the power can be exercised only by the officers or board prescribed and for the purposes authorized. In the majority of the states this power has been greatly restricted by constitutional amendments which prohibit municipalities from giving aid or loaning their credit to private corporations and which fix a maximum indebtedness, usually a certain percentage of the assessed valuation of taxable property. When the debt limitation has been reached, the corporation may contract no obligations which may have to be met directly or indirectly from the proceeds of public taxes. If, however, the indebtedness is contracted for a local purpose, the corporation may be estopped to deny the validity of securities issued therefor.

The general power of taxation for local purposes is usually expressly conferred; it may be implied only when necessary to the performance of a statutory duty or to carry into effect a discretionary power. The discretionary power to tax is rigorously limited to raising revenue for such purposes as the corporation is expressly authorized to undertake, and a general grant of the power of taxation will not be construed to extend the ordinary municipal powers. Local taxation can be exercised only for a public purpose, and whether a purpose is public or not is for the ultimate decision of the courts. The power to levy proportionate assessments upon property especially benefited by a local improvement (*see* SPECIAL ASSESSMENTS), although generally granted, must be expressly conferred and can never be implied from the grant of the general power of taxation or from the power to make local improvements. Because of the constitutional limitations upon taxation and municipal indebtedness, special assessments have been extensively employed to finance the cost of street improvements, the construction of sewers and the purchase of lands for parks. While special improvement bonds are primarily to be met from the assessment laid against the property benefited, generally the municipality becomes directly liable upon its failure to make collections sufficient for their liquidation.

Another important auxiliary power usually delegated to municipal corporations is that of eminent domain (*q.v.*). This power also must be expressly conferred either by a general grant

or for a specific public improvement. The state courts have uniformly held that in the absence of an express provision in the state constitution only such property may be condemned as is essential for public use in connection with the improvement for which it is authorized. Within recent years nine states have adopted constitutional amendments to validate condemnation of lands in excess of those actually required for a given public improvement (*see* EXCESS CONDEMNATION), but even in these states it has seldom been used and the question is still open whether under the Fourteenth Amendment it could constitutionally be exercised solely to defray the expense of a public improvement.

A municipal corporation is most clearly distinguished from a quasi-municipal corporation by its power to enact ordinances of local police which have the force of law within the municipal limits. The power of the state legislatures to delegate this sovereign power to municipal corporations has never been questioned. Although municipal charters usually contain a clause conferring this discretionary power for the general welfare of the locality, the scope of such general grant is cut down and often made inoperative by the specific enumeration of local police powers. The delegated power must always be reasonably exercised within the limits of the policy of the state as declared by its constitution and the general statutes. The municipality has no implied power to extend the scope of its delegated police power by any act of its own. Thus the power to enact general zoning ordinances was not upheld until general empowering statutes were enacted. Authority to enact police ordinances operative beyond the boundaries of the municipality has frequently been conferred for the protection of the health and morals of the community and to permit effective city planning. Police ordinances will not be binding upon the corporation itself or upon the state. The local power may be exercised by different overlapping municipalities upon the same territory, but subject to the primary rule that no two corporations may exercise the same local legislative power upon the same territory. The ultimate control of the state legislature over local legislative powers is plenary and it may re-assume direct exercise at any time. The municipality has the implied power to enforce its ordinances by the imposition of reasonable fines, but the power to attach the sanction of imprisonment must be specifically granted. Infractions of ordinances may be punished summarily with-

out trial by jury, unless the state constitution or statutes provide otherwise. The power to impose license fees must also be expressly granted.

All property of the municipal corporation devoted to a public use is considered to be held in trust for the public. It is exempt from execution and from taxation or condemnation by other local governmental agencies, except as expressly authorized by statute. Municipal property used for public purposes may not be conveyed or mortgaged without legislative consent. In the conduct of its local business affairs, such as the operation of public utilities, the municipal corporation is held to the same limitations as a private corporation authorized to engage in a similar enterprise and is similarly bound by its contract obligations. But the legislature may deprive the municipal corporation of its trusteeship and transfer the title to its so-called private property to other local governmental agencies or vest in state administrative boards the control over its business affairs. Upon the dissolution of a municipal corporation or the readjustment of its boundaries, the legislature may allocate its assets and liabilities among its successor corporations, subject only to the limitations imposed by the federal or state constitutions to protect the existing rights of creditors.

The liability of a municipal corporation upon a contract implied in law for benefits received is far more restricted than in the case of private corporations. A municipal corporation will not be held liable upon such a contract which is illegal or *ultra vires* the corporation. Furthermore no recovery in quasi-contract is allowed upon a contract within the general powers of the corporation, where the effect of allowing such recovery would be to nullify the mandatory provisions of statutes enacted to safeguard the interests of the taxpayers. Where, however, money has been turned over to a municipality in good faith under a contract void because *ultra vires* or *malum prohibitum* and has been expended for legitimate municipal purposes, a recovery in quasi-contract will be allowed. Similarly, money paid to a municipality under compulsion through the illegal exercise of the power of taxation or of special assessment may be recovered in a quasi-contractual action. An appropriate action, other than that in quasi-contract, may be instituted by the owner where personal property has come into the possession of a municipal corporation under an agreement void because *ultra vires* or because it contravenes a mandatory provision of the charter; under

these circumstances the seller may recover his property in kind.

With reference to liability in tort the prevailing American doctrine is that a municipal corporation is not liable to respond in damages for the negligence of its officers, agents or employees when they are acting in the discharge of so-called governmental functions. Among these functions are education, health, public charities and the protection of persons and property. The municipality will be held liable, however, for the negligent acts of its officers and agents acting within the scope of their authority, when they are performing corporate or proprietary functions, which include all those from which it derives a substantial revenue and, in many states, also those which are carried on primarily for the convenience or benefit of the inhabitants of the locality. Such functions include the furnishing of water, light, power and transportation and the management of any municipal property from which a substantial revenue is derived. The courts furthermore uniformly charge municipal corporations with liability when the injury complained of is a positive trespass to real property or a nuisance created by the acts of its officers. In no case will a municipal corporation be held liable for acts which are *ultra vires* the corporation or for failure of the municipality to exercise its legislative or its police powers. In most states the common law duty is imposed upon municipal corporations to keep the streets and highways committed to their care in a reasonably safe condition of travel, and in the other states such liability is imposed by statute. There is a marked tendency to extend by statute the liability of municipal corporations in tort for the negligence of their officers and agents in the discharge of the governmental functions of the corporation.

Within the general principles enumerated, the law relating to municipal corporations in the United States is more complex than in any other nation. Except for the limitations of the federal constitution, municipal government, outside the District of Columbia and the territories, is left entirely to the determination of the state authorities. The multiplicity of separate jurisdictions makes possible innumerable experiments in organization. One of the most important political problems before the people of each state is how to adjust its municipal system to the centralizing tendencies induced by social and economic changes and to preserve at the same time the vitality of the principles of local self-government. Coincident with the growth of restrictions

upon the power of the state legislatures by constitutional provisions for home rule, the states are more and more resuming direct control over many functions, such as education, health and highways, which were formerly committed to the municipalities. On the other hand, the municipal corporate status is being extended in many states to all the local governmental authorities, such as counties and towns, and wider powers of intercorporate action for regional planning and utility services are being conferred upon them. With the extension of such powers and the increase in state subventions, there is a distinct movement toward the establishment of an administrative control over municipal finance similar to that in England. The fact that a central administrative supervision, which would make possible the delegation of powers to municipal corporations in more general terms, has never been tried out in any state in the United States is due primarily to the history of the institution and the persistence of the political theory that local liberties are less endangered by legislative than by administrative or bureaucratic control.

MUNICIPAL COUNCILS. See MUNICIPAL GOVERNMENT.

MUNICIPAL COURTS are the tribunals of first instance for the administration of justice in the cities. As such they stand in a peculiarly close and vital relation to the people, especially to the poorer classes in the crowded sections. Those who dwell in the tenements rarely come into contact with any other courts, hence it is from the work of these municipal bodies that they obtain their conceptions of what justice or injustice implies. The judicial branch of local government, however, is one of the hardest to keep on a high plane of probity. The pressure of political and personal influences upon the administration of justice in the local courts of large cities exerts itself upon the slightest opportunity.

The history of judicial administration in the cities of Europe and America is a long and complicated one, extending over at least twenty centuries. Since Athens was a city-state, the Athenian dicasteries may be regarded in a sense as municipal courts. When Rome during the imperial era maintained a regular professional magistracy, magistrates also functioned in the provincial cities throughout the empire. But with the decline and fall of Roman power this magisterial system collapsed and on its ruins a feudal jurisdiction arose and spread over a large part of Europe. Since feudalism was not merely a system of landholding but a scheme of legal jurisdiction based on the tenure of land, the feudal lord held court with authority over his dependents in town and rural community alike. When, however, large numbers of dukes and counts and barons took part in the crusades during the twelfth and thirteenth centuries they found it necessary to raise money for their expeditions. For this reason they were willing to bargain with the towns for the exemption of the latter from feudal jurisdiction in return for cash payments. Many of the French communes obtained in this way their charters of privileges; these gave them the right to maintain their own municipal courts in lieu of the lord's tribunal, which hitherto had been amerced the townsmen for the profit of the baronial treasury. Although the spread of this judicial immunity was stimu-

lated by the crusades it was by no means wholly due to them. More broadly it was the logical outcome of urban growth in population, wealth and power.

In England the granting of borough charters with judicial privileges came chiefly from the king rather than from his barons, because most of the towns lay within the royal domain. When an English borough obtained the right to maintain its own local court, the judicial function was usually entrusted to the mayor or to a special justiciar or to the aldermen. No outside official, save only the circuit judges of the king's high court, could come into the enfranchised borough and conduct trials, and even these royal justices had the right only in cases of major importance beyond the charter competence of the borough. Appeals from the borough court were also heard by them, and in some cases appellate jurisdiction was vested in the county court as well.

In the continental countries, especially in France, the enfranchised jurisdiction of the communes did not last very long. Royal intervention in local affairs during the seventeenth and eighteenth centuries led to the placing of the king's appointive officers in immediate charge of the municipal courts and indeed of the entire local government. In France these appointive judges developed into hereditary functionaries, for the Bourbon kings found that they could secure considerable revenue by selling local judgeships with hereditary rights attached. In Prussia likewise such municipal posts were often given to royal favorites or used as a means of pensioning aged officials of the central government.

It was not until after the French Revolution that a general reorganization of the municipal courts took place in the countries of continental Europe. France came out of the great convulsion with a judicial system which was at once homogeneous and highly centralized. The municipal courts of France since the time of Napoleon I have been an integral part of the national system. Their judges and officials are appointed by the president of the republic on recommendation of the minister of justice. In Prussia the reform of the municipal judiciary came with the general reorganization which took place under Freiherr vom Stein after the Peace of Tilsit. The states of the Italian peninsula also centralized their systems of municipal jurisdiction during the Napoleonic era.

Thus in these various countries during the past century there have been no municipal

courts in any strict sense of the term. The administration of the law in cities as well as in the rural districts is entrusted to magistrates who form the lowest rung in the ladder of the national judiciary. The methods of selecting these magistrates as well as the scope of their authority and the procedure which they follow are determined in each country by the national laws. In all cases they are appointed, not elected.

In England the reorganization of the local courts did not come until long after it had been effected on the continent. Well into the nineteenth century the English borough courts continued to be manned by aldermen or by unpaid justices of the peace. This indeed continues to be the case at the present day in the smaller boroughs, where a court of petty sessions is held by one or more justices appointed by the crown. But in each of the larger towns and cities a regular municipal court has now been established with one or more stipendiary magistrates at its head. These magistrates, as their title implies, are salaried officials paid from the borough treasury but appointed by the national government.

Such courts are known as courts of summary jurisdiction. They have jurisdiction over misdemeanors and minor offenses against the public order, especially those which constitute violations of the town by-laws. In addition they conduct preliminary hearings in the case of persons charged with more serious offenses, and they have power to order such offenders held for trial in the higher courts. Stipendiary magistrates hold court daily and dispose of cases in much the same fashion as do the police justices of American cities. From their decisions an appeal may be taken in most cases to the higher tribunals. Jurisdiction in civil cases is not usually vested with these borough courts but belongs to the county court.

In colonial America, when the earliest boroughs were chartered, there was no clear distinction between legislative and judicial functions. Hence the mayor and the aldermen exercised jurisdiction in both fields, although there were separate meetings for the two purposes and the records were kept distinct. Sitting in their judicial capacity these officials constituted "the court of the mayor and aldermen." They penalized violations of the ordinances which they themselves had made. The boroughs were small, however, and the court of the mayor and aldermen had very little to do.

But as the cities and towns of the Atlantic

seaboard became more populous during the latter half of the eighteenth century, the mayor and aldermen found that their judicial duties interfered with the performance of their other functions. So the duty of holding court was gradually turned over to a special officer, usually known as the recorder of the borough, or to a magistrate appointed for the purpose. This change was expedited by the general acceptance of the principle of checks and balances which became embodied in the new state and national constitutions after the revolution. Even today, however, the American municipal judiciary retains a trace of its colonial ancestry in the charter provisions, which frequently designate the mayor as an *ex officio* justice of the peace and sometimes even authorize him to preside in the municipal court whenever the regular judge is absent.

At the outset the municipal recorders, magistrates or justices of the peace were appointed by the city council or in some cases by the governor of the state; but as new communities developed in the western portion of the United States, it became the practise to have them elected by popular vote. The emphasis on an elective local judiciary became strong in the Jacksonian era but it did not affect all portions of the country to the same extent. Hence the diversity which one now finds in the methods of organizing American municipal courts. In some cities, especially in New England, the municipal judges are appointed by the governor; in others, as in New York, they are appointed by the mayor; but in a majority of the states they are elected by popular vote for relatively short terms.

Originally moreover there was a single municipal court for each city. But with the growth of cities in size it became necessary to provide more judicial machinery. This was usually done by dividing the community into two or more districts with a municipal court for each. Sometimes a separation was also made between criminal and civil jurisdiction.

To the local courts with summary jurisdiction in minor criminal cases the name police courts was usually applied. As a rule these courts were also empowered to give a hearing, in the first instance, to persons accused of more serious offenses and to hold the accused for trial by a higher court or for the presentation of the case to a grand jury. When the work became too heavy for a single police court the earlier practise was to establish additional

tribunals of the same kind, dividing the city among them.

In due course the disintegration which resulted from this process of jurisdictional division developed to a point where it approached judicial chaos, with a half dozen or even a dozen municipal courts functioning in different parts of the same city, hearing all kinds of local litigation, under no unified supervision and with judges usually chosen for political reasons. Dealing with a wide variety of cases, including ordinary misdemeanors, traffic violations, juvenile offenses, domestic relations and even small civil claims, these courts did not become proficient in handling any of them and their methods disclosed such a wide diversity that much dissatisfaction resulted.

In recognition of the need for specialization in the work of the municipal courts a movement for the reorganization of the city's judicial machinery has been making headway during the past thirty years. Several of the largest American cities have now unified their judicial organization by establishing a single court with its work divided among several branches, each of which deals with cases of a designated type. In other words the division is functional, not geographical. In Chicago, for example, there is now a single court with a chief justice and more than thirty associate justices. The latter are assigned to hear various kinds of cases—criminal charges, civil claims, traffic violations, juvenile offenses, cases involving domestic relations, small claims and so on. Each court confines itself to its own specialty. Detroit and Cleveland have also unified their municipal judicatures and provided for a somewhat similar division of court work.

New York City still maintains a separation between criminal and civil jurisdiction. Most criminal cases come in the first instance before the magistrates' courts, but more serious offenses go directly to the Court of Special Sessions or to the Court of General Sessions. Special magistrates' courts are also established for traffic cases, night court cases, juvenile cases and cases arising out of domestic relations. The magistrates and justices of all these courts are appointed by the mayor. Minor civil cases come before the civil justices of the Municipal Court, who are elected by popular vote. Thus the judicial system of the metropolis is decentralized and as yet rather poorly coordinated. In 1928, however, the civil municipal courts were centralized to a large extent by the creation of a presiding justice with large supervisory powers.

Some years ago the American Judicature Society put forth a model plan of judicial administration for use in rather large cities. This plan proposes a single court with unified criminal and civil jurisdiction. Its work, however, would be apportioned into five general divisions and each of these divisions would have a divisional chief justice with power to assign the individual justices to their respective fields of work. The five presiding justices of divisions together with the chief justice of the municipal court would determine the rules of procedure and exercise a general supervision over the workings of the city's judicial machinery. In this way there would be centralization and uniformity combined with flexibility of procedure and an opportunity for the development of judicial specialization.

The tendency of American municipal court organization is in the general direction indicated by the foregoing proposal. The great number and variety of matters coming before the municipal courts of the larger cities make it desirable that the cases be classified and assigned to special branches of a unified court in which the procedure is adapted to the efficient administration of justices for each class. The extent to which the classification may be carried will depend on the size of the city. A small city needs only a division between criminal and civil cases with special sessions of the municipal court for juvenile cases and for small civil claims. A large municipality is likely to require a further decentralization of the work with provision for a night court, a traffic court, a morals court, a court for the settlement of domestic controversies and perhaps a special court for dealing with infractions of the liquor laws.

Numerous evils and abuses are connected with the work of American municipal courts, especially in the larger cities. These are mainly due to the sinister influence of metropolitan politics upon the judges and court officials. The first thought of every arrested offender is to seek the intercession of some local politician on his behalf. In every large city one can find a dozen of these local "fixers" around the courthouse lobby each morning. Their power comes from the fact that magistrates and prosecuting officers so frequently owe their positions to the favor of party organizations.

The administration of justice in American cities has also suffered by reason of the ease with which cases may be appealed from the municipal courts and the frequency with which

the penalties imposed by the latter are reduced or set aside. Appeals are also utilized to bring about unreasonable delays in the execution of penalties; in fact the history of a criminal trial in any large American city is often a long record of hearings, continuances, postponements, objections, rehearings, motions in arrest of judgment, exceptions, pleas for a new trial, applications for probation and various other devices which the resourcefulness of a defendant's lawyer can suggest.

To some extent reform may be achieved by giving the cities home rule with respect to the organization and procedure of their municipal courts. The application of uniform provisions to all the cities of a state is obviously not a wise plan, because there are wide differences among them in size and in the texture of their populations as well as in the kind of work which the municipal courts have to do. Home rule in the administration of municipal justice would permit experimentation with remedial measures.

It has been said and it is probably true that American municipal democracy has made its poorest showing in the administration of criminal justice. The reasons for this situation are so widely ramified that they cannot be exorcised by any one remedial measure. Instead it will be necessary to secure an improvement in both the personnel and methods of law enforcement, greater specialization in municipal court work under unified supervision, an elimination of political influences in the selection of judges, a reform of the bail-commissioner system, simplified court procedure, a reasonable limitation upon the privilege of carrying appeals to the higher courts and an improvement in the caliber of the lawyers who appear in police court cases. No one of these reforms is more essential than any other.

T., *The Municipal Court of Chicago* (Chicago 1928); Tuttle, E. W., *A Treatment of Municipal Courts in California* (San Francisco 1926); Social Science Research Council, Committee on Survey of Research on Crime and Criminal Justice, *A Guide to Material on Crime and Criminal Justice*, compiled by A. F. Kuhlman (New York 1929) p. 317-19.

MUNICIPAL FINANCE is the process by which city governments raise and spend the money necessary for their support. Until recent times this process was comparatively simple. Even the city governments of two or three generations ago had only a limited number of functions, whose financial requirements were met without much difficulty from a few sources of revenue. But today these governments are vastly different. Largely as a result of the machine age, cities in nearly every part of the world are fast becoming industrial centers with rapidly growing populations. This development has already brought about the wide extension of municipal functions and consequently a vast increase in the financial requirements of city governments. Although this great expansion has perhaps been more marked in the United States than elsewhere in the world, the growth of cities in this country during the past thirty years is nevertheless typical of the general trend. In 1900 there were 135 cities with 30,000 or more inhabitants, comprising an aggregate population of 19,000,000, or 25 percent of the total population of the country at that time. These cities spent a total of about \$500,000,000 during that year. By 1930 the cities of this class in the United States had more than doubled in number, their population had increased approximately two and a half times, while their total annual expenditures had multiplied sevenfold.

An impression of the scope, variety and relative importance of municipal expenditures may be gained from an analysis of the major groups of municipal functions. The statistical data

available in the United States and in England permit an interesting comparison between these two countries. While in the British figures tabulated by the Ministry of Health there are included smaller and less urban governments than in those of the United States compiled by the Bureau of the Census, the statistics are nevertheless fairly comparable. It is interesting to note, in the percentages of Table 1, the relative emphasis placed upon the different functions by the two countries. Despite their very similar racial and cultural characteristics there are, however, some wide divergencies. For example, the United States spends more than twice as much as do England and Wales on general government and protection, half as much on highways and public welfare, much more on education and nothing on housing and town planning. This is significant as indicative of the current trend of municipal development in the two countries.

TABLE 1

PERCENTAGE DISTRIBUTION OF MUNICIPAL EXPENDITURES, UNITED STATES AND ENGLAND, 1930

FUNCTIONS	UNITED STATES	ENGLAND AND WALES*

The distribution of municipal expenditures in Denmark (Table II) may be taken as typical of fairly stable countries in western Europe. Germany, Holland and Sweden follow a similar pattern in their municipal finance.

A markedly different distribution is revealed in the compilation of the Statistical Bureau of Tokyo covering the expenditures of the six large cities of Japan. Here the emphasis is on public works, more than one half of the total expenditures going to this function. Education claims a fifth of the total, while social welfare is allotted only a very small percentage. Protection, includ-

ing police and fire, is under the control of the national government, so that it does not appear among the municipal activities.

The municipal expenditures examined above are mainly those of an operating character. Capital outlays and debt charges are generally not included. During recent years city governments in nearly every country have enormously increased their expenditures for capital outlays. This is particularly true in the United States, where a nation wide attempt has been made since 1929 to combat unemployment by speeding up capital expenditures. During 1930, for example, the 310 cities of the United States with 30,000 population or more spent \$1,115,000,000, an amount equivalent to about 50 percent of their expenditures for all other purposes. Most of this money, not only for this year but for other years, was raised by the sale of municipal securities. As a result the gross debt of these cities has grown by leaps and bounds; it was over \$10,000,000,000 at the close of 1930. After the deduction of sinking fund assets a net debt of \$6,857,240,000 remained; this is equivalent to a net debt per capita of \$144.57. The annual interest charges for 1930, according to the United States Bureau of the Census, were \$405,153,000. Capital expenditures by the local governments of England and Wales amounted to slightly more than £83,000,000 for the fiscal year ending March 31, 1930, which was about 25 percent of the total expenditures of these governments for all other purposes. The net debt of these governments at the end of this period was £1,157,879,087, with a net debt per capita of £29. 5. 0. But 36 percent of this belonged to the trading undertakings, the loan charges being paid from their earnings.

The expenditures of municipal enterprises or trading undertakings are growing in importance

in most countries. In the 310 largest cities of the United States the operating expenditures of municipal enterprises for 1930 amounted to \$178,110,000. Water supply was by far the most important of these; next came electricity supply and then a number of smaller enterprises, such as street railways, gas supply, docks, markets and cemeteries. It cannot be said as yet, however, that these enterprises have assumed very large proportions in the municipal expenditures of the United States. England has developed trading undertakings to a much greater extent in its local governments; the aggregate expenditures of these in England and Wales for the year ending March 31, 1930, amounted to £112,000,000. Electricity supply and transportation (tramways and omnibuses) were about of equal importance and together comprised approximately 50 percent of the total expenditures of local trading undertakings. Water supply and gas supply were nearly equal, representing approximately 30 percent of the total for both, with 20 percent left for the remaining enterprises, consisting mainly of harbors, docks, piers, canals, ferries, markets and cemeteries. In Germany, Switzerland and the Scandinavian countries such expenditures assume even greater importance than they do in England. Even in the Orient they are not to be overlooked, since the leading Japanese cities have large electricity works and to some extent water and gas works.

The general character of municipal revenues in some of the leading countries may be indicated by an enumeration of the main sources from which these revenues are derived. While city governments of the United States have numerous sources of revenue, only a few are of any importance (Table III). It should be noted

TABLE III

PERCENTAGE DISTRIBUTION OF MUNICIPAL REVENUE BY SOURCES, 310 LARGEST CITIES IN THE UNITED STATES, 1930

SOURCES	REVENUE
General property tax	63.8
Special taxes	5.8
Special property taxes	2.4
Poll, or head, tax	0.2
Business and non-business taxes	3.2
Special assessments and special charges	6.9
Subventions and grants	5.8
Miscellaneous sources	7.7
Fines, forfeits and escheats	0.6
Highways privileges, rents, interest	4.6
Departmental fees and earnings	2.5
Earnings of public service enterprises	10.0

that the general property tax, the principal source of municipal revenue, is one in name only, being in practise a tax on real property. In several states special taxes on corporations, incomes, inheritances and mortgages are collected by the state governments and the receipts shared with the city governments. But these receipts constitute only a small part, approximately 3 percent, of the total city revenues.

The local governments of England and Wales secure their revenues from four main sources. The most important of these, levied on the rental value of real property, is local rates, which constituted 36.4 percent of the total revenues for the fiscal year ending March 31, 1930; grants from the national Exchequer accounted for 25.2 percent of the total, miscellaneous sources, such as fees, rents and so on, 11.1 percent, earnings from trading enterprises 25.6 percent and special funds 1.6 percent.

The municipal revenue systems of the countries of continental Europe generally possess a greater variety of sources but are more restricted than that of England. The municipalities are usually limited by the national governments as to the amount of revenue they may raise by taxation. In France, for example, the most important source of revenue for the communes is the addition, to certain of the national taxes, of so many hundredths, or *centimes additionnels*, as they are called. The number of centimes which may thus be added by the local authorities is governed by state law. There are four so-called "direct" national taxes to which centimes may be added for municipal purposes: the land tax, the land and buildings tax, the tax on the rentals of houses and apartments and the license tax on trades and professions. The centimes constituted in 1926 about 28 percent of the total revenues of the communes. The taxes collected by the state, called *fonds communs*, amounted for this same year to 13.4 percent. The *octrois*, a series of local customs duties, produced 13.1 percent. The two remaining general sources are municipal fees of various kinds, including the so-called poor taxes, which produced 26.6 percent, and the sundry communal taxes, the most important being the road tax, which amounted to 18.9 percent.

Several European countries, notably Belgium, Italy, Spain and Switzerland, have municipal revenue systems similar to that of France. They use the additional centimes under much the same legal restrictions. Although the *octroi* in France is becoming less important than for-

merly, it still continues to be one of the chief sources of revenue in Spain. It is practically unknown outside of Europe except in British India, where it constitutes a large source of revenue. The French system of levying taxes on a long list of specified objects, such as domestic servants, pianos, motor cars, billiard tables, sale of liquor and tobacco, horses and visitors, is followed by several other countries, especially Belgium, Czechoslovakia and Estonia, and by certain Swiss cantons. In some countries of Europe a local income tax may be levied directly by the municipal authorities. This tax forms one of the chief sources of revenue in Denmark, Holland, Finland, Norway and Sweden. In the urban communities of Denmark, for example, the income tax contributed 45.9 percent of the total revenue for the fiscal year ending March 31, 1929; rates provide 11.8 percent; other taxes, mainly on motor vehicles, 7 percent; and earnings from public undertakings, 35.3 percent. In Holland practically all the communes levy an income tax for local purposes, which is collected in many cases by state officials and paid over to the communes. In Germany the bulk of local tax revenue is derived from taxes on land, buildings and business. Local income taxes were of importance at one time, but even before the World War the states restricted the local use of this form of taxation on the ground that it was unsuitable for local purposes and interfered with state income taxes; since the war the income tax has become a federal tax with the states and localities sharing some of the proceeds. In Soviet Russia local tax revenue is composed mainly of the shares of national taxes assigned by the central authority and of revenue derived from local additions to some of the state taxes; non-tax sources, such as earnings from trade undertakings and public property, supplied 39 percent of the total local revenue in 1927-28. In Japan the system of municipal revenue combines features which resemble both the American and European systems. The Japanese cities have practically no independent taxing power and rely mainly on surtaxes laid upon the national and prefectural taxes. The principal sources of revenue for the six leading cities of Japan for 1929 were city taxes, 17.4 percent; state and prefectural subsidies, 17.3 percent; earnings from property and undertakings, 37.6 percent; and the remainder, or 27.7 percent, fees, assessments, contributions and miscellaneous income.

In the operation of municipal undertakings, particularly in England and in Germany, where

they assume considerable importance, different policies are followed by governmental authorities with reference to their earnings. In England it is the general policy to operate these undertakings on the minimum charges consistent with efficient service and the maintenance of adequate reserves. Any profit from them, which may be transferred to the support of the general municipal budget, is regarded as an indirect tax. In Germany, however, municipal undertakings are generally operated with the idea of making a profit which may be used for the support of the regular municipal services and thereby reduce somewhat the direct tax burden of the localities. So far no definite policy seems to have been developed with reference to the earnings of municipal undertakings in the cities of the United States, but except in a few cities these have not as yet assumed much importance.

The financial organization of municipalities varies considerably from one country to another and is often greatly influenced by the nature and extent of state or national control. Sometimes it differs widely even within a single country, the greatest lack of uniformity being shown by the cities of the United States. In some cities in the United States the financial organization is quite decentralized; there are several fiscal officers, such as auditor, comptroller, treasurer, tax collector and assessor, who are more or less independent of each other and of the city executive. In order to make a scattered financial organization of this character workable some cities have set up a board of estimate consisting of the mayor, one or two representatives of the council and the important fiscal officers. But this device has not been popular. Other cities, as, for instance, Boston, have established executive control over their several fiscal agencies without consolidating them.

The development of a single department of finance was the outgrowth of the commission type of city government, which originated in the United States about 1900. The commission type soon displayed serious weaknesses, however, some of which hindered effective financial administration and control. Its popularity has therefore greatly declined in recent years, and it has been displaced in many instances either by the manager type or by the strong mayor type of city government. These types have in most cases carried over the centralized department of finance, extending its powers and functions. Today this department represents our most advanced form of financial organization. It is usually

headed by a director of finance appointed by and responsible to the manager or to the mayor. Generally it has four or five bureaus, particularly in the larger cities, designated as control and accounts, treasury, taxation, purchasing and budget, with an officer responsible to the director of finance in charge of each bureau. The bureau of control and accounts performs the current auditing of receipts and expenditures and maintains the general accounts; the treasury attends to the collection, custody and disbursement of city moneys; the bureau of taxation covers the assessment of general property, unless otherwise provided by state law, and looks after the levy of special assessments and the administration of minor taxes; and the bureau of purchasing is in charge of centralized buying for all city agencies. Supervision of the preparation and execution of the city's budget are the main functions of the budget bureau. Debt administration is generally a function of the department of finance, including the management of sinking funds. Municipal pension funds are often handled by this department, and sometimes general supervision over the city's employees is vested in it. Some provision is often made for the auditing of municipal finances independently of the city executive and the department of finance. Frequently this function is performed by an auditor appointed by the city council, who may be either a permanent officer or a qualified accountant temporarily employed.

In England and Scotland the financial organization of cities is fairly uniform. Responsibility for the administration of the major municipal functions usually rests with certain committees of the council. The fiscal functions are under the general direction of the finance committee, which delegates the actual administration of these functions to the chief finance officer, who is a permanent official, usually called the treasurer in England and the chamberlain in Scotland. He and his departmental staff perform such duties as the preparation of the budget, general accounting, current auditing, rating, revenue collection, custody of funds and debt management. Thus the financial functions are fairly well integrated in most of the cities. Costing and centralized buying have not yet been developed to any marked degree.

The cities of continental Europe are nearly all subject to a system of national control, which is not to be found in the United States and only to a small degree in England. The French system, which has influenced most of the other Euro-

pean countries, especially Belgium, Italy and Spain, is highly centralized, the local units of government being controlled as to their finances and many of their other functions by agents of the national government, called prefects. The most important fiscal officer of the French municipality is the treasurer, *le receveur municipal*. In the larger municipalities, where the annual revenues exceed a fixed amount, this officer is appointed by the president of the republic on the recommendation of the minister of finance, but in the smaller municipalities his appointment is made by the prefect. In either case the choice is generally made from three names submitted by the municipal council. The treasurer's office may be combined with that of the tax collector (*précepteur*); this is usually the practise in the smaller communes. The treasurer is the head of the city's department of finance and custodian of the communal funds. While responsibility for municipal payments rests primarily with the mayor, the treasurer may refuse to honor the mayor's warrant when there is no appropriation for the purpose or no funds are available or when the warrant is not supported by proper vouchers. The treasurer must submit an annual report to the municipal council and also to the national receiver of finances. If the municipality spends more than a specified amount, this report must be submitted also to the national court of accounts (*cour des comptes*), which has the authority to audit the entire field of public finance.

In Italy the municipal organization, including the fiscal structure, has been largely transformed by recent decrees of the national government. These decrees have vested sweeping powers over the financial and other administrative matters of city governments in the national agents. Whether this will be a temporary or a permanent policy of the Fascist regime is not yet apparent.

The finances of German cities, under the existing economic stress, are being subjected to increasing regulation on the part of both the Reich and the state governments, although considerable power still remains with the city authorities. The main responsibility for fiscal administration rests with the city executive, who has the assistance of a treasury, or finance, department, usually headed by the chamberlain (*Kämmerer*). The municipal accounts are centralized in this department and the financial reports emanate from it. There is also an auditor's bureau or staff which examines the treasury at frequent intervals. In Holland the financial structure of the city governments resembles

that of the German cities, but the control exercised over local finances by the national government is not unlike that under the French system. The cities of Denmark, Norway and Sweden usually have their financial functions centralized in a single municipal department, whose administration is controlled in a large degree by national regulations.

Budgeting may be called the first requisite of effective financial administration. It has been in vogue longest among the cities of Great Britain and continental Europe, and only within the past two or three decades has it been applied in the municipal governments of the United States. As yet no uniformity has been developed in the budgetary methods of the different cities of the United States, because of variations in municipal organization and of great diversity in local practises and in state legislation. But it is possible roughly to trace certain similarities of budgetary procedure as at present practised.

There are three or four types of municipal budgeting authorities in the United States. When the municipal organization is such as to center the administrative powers in the mayor or the manager, these officers are usually responsible for the preparation as well as the execution of the budget. In this work they generally have the assistance of some staff agency, such as the department of finance. Under other types of municipal organization the budget may be prepared by the city council or commission, by an administrative-legislative board or by an independent fiscal officer; in these cases authority over the execution of the budget is often quite diffused. No such difficulties are to be found in most other countries, since their types of municipal government are generally uniform and the procedure for preparing and executing the budget is rather well defined. The voting of the budget is universally a function of the municipal legislative body, subject in some countries to approval by a department or agent of the superior government.

In the United States the municipal budget is not always a comprehensive plan; that is, it does not include all financial proposals of the government. Usually it covers purely operating requirements, sometimes even omitting the municipal undertakings. Capital requirements are frequently not included in the general budget but are planned independently during the fiscal year. In this respect the municipal budgets in the United States lag behind those of some of the European countries, notably England, where the

municipal budgets are quite comprehensive, usually including all municipal undertakings either in the general plan or as annexes to it. Some cities in the United States, however, have combined long term financial planning, especially for capital improvements, with their annual budgeting, thus advancing even beyond European practise in this regard.

In preparing the budget city authorities in the United States usually prescribe printed forms upon which the estimates are submitted, and they require these estimates to follow classifications of expenditures and income which are more or less uniform. Such is seldom the practise among British municipal authorities or those of continental Europe, who have not thought it necessary thus to govern the details of budgetary information. Nevertheless, the estimates are generally more carefully prepared, especially with reference to income, than are the estimates of municipal authorities in the United States.

In the execution of the budget many municipal authorities in the United States rely upon exceedingly ineffective methods consisting largely of formalized accounting and auditing, political checks and balances and legal restraint. Some city administrators have recently applied the technique of allotting appropriations for the fiscal year, estimating the rate of flow of income into the treasury, and reviewing and revising expenditure requirements upon the basis of realized income as the fiscal year progresses. These adjustments are usually made quarterly and sometimes monthly. The object is to maintain the budget as a balanced plan throughout the period of its execution regardless of changed conditions other than those of a cataclysmic nature. In the execution of their budgets the municipal authorities of England and continental Europe still depend largely upon the routine methods of accounting, auditing and reporting and upon cooperation between the finance and the spending officers. Outside of England, however, these authorities are so closely supervised by agents of the superior governments that they have very little opportunity to exceed their appropriations, although they may spend more than their available income when revenues are declining.

General accounting, an important adjunct of budgeting, has not been developed uniformly in municipalities. Aside from the system of general accounting peculiar to France, there are two systems in vogue in the cities of other countries. One of these operates on a cash basis, that is, by

collections and disbursements, and the other on an accrual basis, sometimes called a commercial basis, which records income and expenditure obligations. The latter system is undoubtedly the more effective from the budgetary standpoint. It is supplanting cash accounting at a rapid rate in the cities of the United States, largely as a result of the growth of the budgetary movement. Accrual accounting is likewise gaining in popularity in British municipalities and in the municipalities of some European countries, notably Germany.

Cost accounting, as applied in municipalities, is still a comparatively unexplored field. It is being used in connection with certain municipal functions in a few cities of the United States, but in no case has it been very definitely related to general accounting. In European cities, notably those of England and Germany, where cost accounting is being developed and applied rather extensively, its possibilities as a tool of administration are still largely unrealized.

The purchasing methods of municipalities have been systematized in recent years, particularly in the United States, where a large number of city authorities have centralized their buying of commodities in a single agency under uniform regulations as to specifications, bidding, deliveries and storage. With a few exceptions the municipal authorities of other countries generally operate under decentralized schemes of buying and storing their commodities.

The general methods of treasury management and control are similar in all city governments. Very little advance has been made in these methods during recent years, except perhaps in the matter of billing taxes or rates. In European cities, particularly in England and Scotland, treasury officers are usually more aggressive in collecting municipal taxes than they are in the United States.

In the handling of municipal moneys city treasurers in the United States, almost without exception, are handicapped by the establishment of a number of special funds into which the current receipts are placed. When the available cash in the treasury is thus segregated, there is little or no mobility in the treasury balances. Aside from hampering treasury operations, special funds restrict free budgeting and are furthermore of doubtful advantage to the agencies or functions of city government for which they have been established.

Supervision over the financial administration of municipalities by superior governments is in-

creasing in practically all of the leading countries. At the present time this supervision is least felt by the municipal authorities of the United States and of England. In the United States it is exercised entirely by the state governments and relates mainly to four fiscal functions of cities: budgeting, accounting and auditing, taxation and incurring of indebtedness. Not all of the states cover the functions enumerated, and those which do lack uniform regulations. Six states exercise varying degrees of supervision over municipal budgeting, ranging from casual review to approval of the financial requirements as voted in the budget. Twenty states prescribe a system of municipal accounts, while thirty-five provide some kind of audit by state authorities, often not very thorough. About thirty-five states have set up machinery for the equalization of general property valuations as between local units, which includes a review of assessments in about half of this number. Wherever municipal tax rates are controlled by the states, this is done through the imposition of maximum tax limits. The approval of municipal bond issues is required in fifteen states, while a slightly larger number require reports on outstanding indebtedness.

In English municipalities the approval of a department of the national government is usually required whenever grants-in-aid are received for certain municipal functions, such as education, housing, street improvements and construction of bridges, relief work and public assistance. Aside from this supervision, the municipal authorities must secure, practically without exception, the approval of the Ministry of Health or of Parliament in order to issue bonds for capital outlays and municipal undertakings. The accounts of all the local governments, with the exception of some of the boroughs, are gone over annually by the district auditors of the Ministry of Health. Thus the condition of these accounts is established at least once a year and, when necessary, the auditors make recommendations for improving the accounting systems. This audit has no direct counterpart in the cities of the United States.

The supervision over the finances of French municipalities by the national government may be regarded as fairly typical of that followed in many of the other European countries. Under the French system the prefects, who are agents of the central government, control not only the form but the amounts contained in the municipal budgets. They may reduce expenditure items,

and when certain obligatory charges have been omitted by the municipal authorities, they may insert them in the budgets. They approve practically all expenditures, contracts and purchases of property for public use. If the mayor and council of any city think they have been unfairly dealt with, they can appeal to the prefect's superior, the minister of the interior, and from him to the highest administrative court in France, the Council of State. No new or special tax may be levied for any purpose by municipal authorities without the approval of the prefects. Municipal bond issues, in every case of any importance, must have the approval of the prefects and sometimes of the government at Paris. There are no general debt limits, as found in the states of the United States, the French system of approving loans being based entirely upon each city's needs and financial condition.

MUNICIPAL GOVERNMENT has risen to a place of high importance in modern political society not only because urban dwellers now form so large an element in the populations of western Europe and America but because city administration has developed by its complexity into a problem of great inherent difficulty. The rural district requires very little government; its people are habituated to do things for themselves. But when great bodies of people are massed closely together they inevitably become more interdependent. To promote their safety, health and convenience they gradually devolve more responsibility upon the public authorities, and the larger the community the greater is this tendency. The governing authorities of the city are required to take over one by one a long list of duties and obligations which formerly were left to the initiative of individuals.

Undoubtedly the earliest municipal function was that of safeguarding life and property against marauders from outside. Then came the establishment of courts for the maintenance of peace and order within the city gates. Presently the building of roadways became necessary, followed by the setting up of a market place, the construction of some public buildings, the care of the poor and the lighting of the streets by night. Later, with progress in the standards of living, came the function of caring for the public health, providing a water supply, a system of sanitation, schools, hospitals, parks and other places of recreation, public libraries and museums. At the same time it became necessary to control private enterprise in the general interest—hence the development of building codes, public utility regulation, licensing and zoning ordinances. The number of separate functions now performed by the municipal authorities in a large city runs into the hundreds. This discussion is concerned primarily with the governmental structures and agencies established to perform these functions. (For the history of the growth of cities and of the resulting problems, see CITY.)

Although the existence of cities can be traced as far back as the third millennium B.C., no permanent contribution to the art of urban government was made until Greece developed a system of cities which were independent political units governed by the people. The city-state (*q.v.*) of Greece, of which Athens is the outstanding example, performed both local and national functions. The same authorities declared war and made peace, negotiated treaties, author-

ized the construction of streets and public buildings, levied taxes, provided the city with police and controlled the harbor. Only Athenian citizens, however, shared in the process of government; and since they formed a minority of the city's population, Athenian democracy was really government by a privileged class, but a class too large to be called an oligarchy.

With the decline of Greece the seat of urban leadership passed to Rome, which became the richest, most populous and best governed municipality of the ancient world. The City of the Seven Hills, with the adjacent territory, formed a corporate community, or *civitas*, which not only governed itself but served as the source of authority over vast areas from Syria to Spain. In becoming a continental empire Rome never sacrificed its original organization as a city-state; hence the same source of authority controlled the government of distant provinces, maintained the legions on land and the galleys at sea, waged wars, made treaties, promoted trade, constructed highways, provided water supply and sanitation within the city, built public baths, regulated housing and developed facilities for public recreation.

Throughout the imperial territories there were many municipalities, some of considerable importance. At first these provincial cities were given a varying measure of independence; but as time went on they were all placed upon a common basis and ultimately became mere administrative districts, their affairs being controlled by imperial officials appointed from Rome. In the course of their relations with the provincial cities the Romans developed the concept of a municipal corporation (*q.v.*), which has served as the legal foundation for the science of municipal government. Moreover the Romans made great progress in the practical art of city administration, including the building of roads, the provision of water supply and the protection of life and property, as well as in the technique of raising an adequate municipal revenue by taxation.

The collapse of Roman power demoralized the municipal life of western Europe. During the period from the fifth to the tenth century the towns declined everywhere and there was almost complete stagnation in municipal life. About the eleventh century, however, indications of revival of city life appeared in the Mediterranean area and this development was presently stimulated by the crusades. With the economic revival came a partial restoration of municipal inde-

pendence in the larger urban communities of northern Italy, some of which now regained the status of independent city-states (*see* COMMUNE, MEDIAEVAL). Similarly, with the broadening of their trade the ports of the North and Baltic seas increased their economic prosperity and began to shake off the rulership of feudal suzerains. Many of them became free cities, subject only to the shadowy overlordship of the Holy Roman emperor. By the thirteenth century many of these free cities, including Hamburg, Bremen, Frankfort, Danzig, the towns of the Rhine valley and various other trading communities, had formed leagues for their mutual protection, especially the Hanseatic League and the Rhenish and Swabian leagues of cities. Thus the paths of municipal emancipation followed the great commercial currents of the age. Three of these free cities—Bremen, Hamburg and Lübeck—retain their status in the German commonwealth of today; they have their own constitutions and are governed as independent states of the Reich, with state and municipal government combined.

In France the emancipation of the communes did not come so early. Especially in the northern portion of the country, feudalism had achieved its greatest strength and the towns with scarcely an exception had been brought under the control of lay or clerical lords. But as these French towns grew in size during the twelfth and thirteenth centuries, the townsmen set out to obtain the rights of local self-government. Sometimes they revolted, drove out the feudal bailiffs, declared their independence and by force of arms compelled a recognition of their free status through the grant of charters. In other instances they purchased their charters of emancipation. By one process or another most of them had obtained charters before the close of the thirteenth century; they were frequently aided in this struggle by the royal government, which looked upon the rise of the towns as a useful counterpoise to the strength of the feudal magnates.

In England during the same period an analogous movement took place, but because the boroughs or towns lay for the most part within the royal domain rather than in the territories of the barons, most of the borough charters were obtained from the king, not from the feudal lords. The early borough charters moreover were obtained by free grant or by purchase, not by violence or revolt. The privileges granted by these royal or baronial charters varied, but as a

rule they included exemption from feudal dues and the right to elect their own local officers and to control their own courts.

At the beginning of the fifteenth century municipal autonomy was the rule almost everywhere in western Europe. This municipal freedom, however, proved to be of short duration, for with the growth of royal power in the various countries the independence of the towns began to be impaired. Strong monarchical governments extended their authority and the towns were no longer permitted to enforce regulations hostile to one another or to the rural districts. They were compelled to act in conformity with the general policy of the realm; when they resisted they were forced into submission and frequently their charters were taken away. Step by step with the strengthening of national governments the subordination of the cities to the royal or ducal authorities became more pronounced.

World events during the sixteenth century and after greatly increased the importance of the cities of Europe. The growth of maritime commerce with both the eastern and western continents enlarged the importance of the sea-ports everywhere. The distribution of maritime products to the inland regions fostered domestic trade. Hand industries developed extensively in all the towns. Nevertheless, in no country of Europe at the middle of the eighteenth century did the population of the towns form more than a small fraction of the whole people. The industrial revolution gave an extraordinary stimulus to urban growth. The rise of the factory system developed small villages into great industrial centers. It also created a proletariat of factory workers, who were without political privileges but insisted on having them. Under the stress of this rapid growth the old municipal system broke down; rigid control by the central authorities or by close corporations had to be abandoned. The reconstruction of urban government was accomplished during the political convulsions which began with the French Revolution and which continued for several decades thereafter.

In England the existing system of borough government dates from the era of reform in the third decade of the nineteenth century. Prior to that time the government of urban communities by close corporations of freemen had become steadily more unsatisfactory until Parliament, itself reformed by the great act of 1832, authorized the appointment of a royal commis-

sion to investigate the situation. As a result of this commission's report the Municipal Corporations Act of 1835 established the general scheme of government which the English boroughs still retain. The term borough is applied to any urban community which has received a charter giving it the status of a municipal corporation. There are over three hundred boroughs and they vary greatly in size. The large towns and cities—about one fourth of the total number of boroughs—have the status of county boroughs, under which they administer the functions of both borough and county. A county borough charter is not now granted to any borough having fewer than 75,000 inhabitants. The struggle between the counties and the existing or aspiring county boroughs is an important element in contemporary English municipal government (*see* COUNTY COUNCILS). The term city is by usage restricted to those boroughs which are or have been the seat of a diocese or which have been given the title by royal patronage as an honorary distinction.

A large degree of local autonomy is permitted in England, but the formal structure of municipal government is rather uniform. The chief organ of municipal authority in England is the town council, which consists of councilors, aldermen and a mayor, all sitting together. The size of the council is fixed by the borough charter and varies with the population. The councilors are elected by direct popular vote for a three-year term, and in all the larger boroughs the selection is made by wards, each ward electing 3, 6 or 9 councilors. An election is held every year, one third of the councilors retiring annually. Except in London boroughs, where only two signatures are required, nominations are made by petition of at least ten qualified voters, and no party designations appear on the municipal ballot.

After the council elections the councilors choose from their own membership or from the population at large a number of aldermen equal to one third of their own number. These aldermen serve for a six-year term, but one half retire triennially. They do not form a separate body but sit with the council and have the same voting power. When a councilor is chosen to be an alderman, a special election is called to fill the vacancy.

From within their own ranks or from outside the councilors and aldermen together elect a mayor for a one-year term. His position is largely one of honor and social leadership; he presides

at council meetings and represents the city on all ceremonial occasions but has no special powers of an executive character. He does not vote at council meetings except in case of a tie. No remuneration is paid to the aldermen or councilors, but an allowance may be made for necessary expenses incurred by the mayor and he may receive a salary.

The powers of the English borough council are extensive and include both legislative and executive authority. As a legislative body the council is responsible for passing such municipal by-laws as may be found necessary for the protection of life, health, safety and property as well as for the promotion of the public convenience. It adopts the annual budget, fixes the local taxes, or rates, and authorizes any borrowing which may become essential. All borough loans, however, with minor exceptions must be approved in advance by the appropriate department of the national government.

Even more important than its legislative functions are the administrative powers of the borough council. It maintains a series of standing committees, each with immediate supervision over a department of municipal administration—police, fire protection, streets, public health and education; it also appoints the permanent officials in charge of these departments and may remove them at any time. These permanent officials are not selected under civil service rules nor have they any guaranteed permanence of tenure; they are termed permanent because by tradition their tenure is of that nature. The official in charge of each department is given a relatively free hand in its administration, but he confers regularly with the appropriate council committee and works in close contact with its chairman. Recommendations affecting the department are presented by the permanent official to the committee, which submits them to the council, by which they are usually adopted as a matter of course.

Among the permanent officials the most important is the town clerk, who is the pivot of English municipal administration and the English city's nearest approach to a city manager. Usually a lawyer, he serves as the legal adviser of the council as well as its secretary. His office prepares all committee reports in proper form and drafts all resolutions and by-laws. The town clerk acts also as registration officer for the borough in preparing the voters' list.

Public education, which is a borough function, is administered by an education committee

appointed by the council. A majority of the members of the committee must be councilors, but the remaining members are appointed by the council from outsiders recommended by various bodies of laymen. The borough council may delegate to the education committee all its powers with respect to education except that of raising taxes or borrowing money. Since this is commonly done, the education committee enjoys in practice a large measure of independent and final authority. The Local Government Act of 1929 abolished the boards of poor law guardians and transferred their functions to the county councils or to the borough councils in certain of the larger boroughs.

London's scheme of government differs from that of other English cities. But there are three Londons. First there is the City of London, the ancient core of the modern metropolis, occupying an area of about 1 square mile, which is almost wholly occupied by banks, warehouses and public buildings. Surrounding it is the administrative County of London, which includes an area of over 100 square miles with a population of about 4,000,000. Finally, there is the London Metropolitan Police District, or (including the City) Greater London, which takes in a much larger area and has about 8,000,000 inhabitants.

The government of the City of London is vested in the hands of a corporation which governs the City through a lord mayor and three councils (officially called courts): the Court of Aldermen, the Court of Common Council and the Court of Common Hall. The aldermen and the common councilors are elected by wards, while the Court of Common Hall is a sort of town meeting. Most of the power rests with the Court of Common Council, which manages all the municipal services through its committees. The lord mayor is elected annually by the Court of Aldermen from two aldermen who have been nominated by the Court of Common Hall and who have previously served as sheriff. The office of lord mayor is an altogether honorary one, for he performs no executive functions.

The administrative County of London is governed by a County Council consisting of 124 elected councilors and 20 aldermen. As in other cities the councilors are elected by popular vote and choose the aldermen either from within their own ranks or from outside; councilors and aldermen sit together and have the same voting powers. Together they elect each year a chairman of the council, who has no powers save

those of a presiding officer. The powers of the London County Council are extensive (*see METROPOLITAN AREAS*). As in other cities the functions of the council are delegated to a series of committees, which in turn devolve a large part of the work upon the permanent officials. The higher permanent officials are appointed by the council at its discretion, but subordinate officials are now selected by civil service competition. Within the administrative County of London moreover there are twenty-eight metropolitan boroughs, each with its regular borough council, which has jurisdiction over certain branches of local administration.

Neither the County Council nor the borough councils have anything to do with the policing of Greater London. The City has its own police establishment, but the county and surrounding circle are included in the Metropolitan Police District. At the head of this district is a police commissioner appointed by the national government. The commissioner has charge of organization and discipline; but the financial administration of the force, including the erection and management of police stations, the awarding of contracts and the purchasing of supplies, is in the hands of a receiver, likewise appointed by the national authorities.

The system of municipal government in Scotland and in Ireland is very similar to that in England; in Scotland, however, the nomenclature of the local authorities is somewhat different and in Ireland a modification of the American city manager system has been introduced, notably in Cork in 1929 and in Dublin in 1930. The British dominions have also followed the general example of the mother country in their municipal systems, but in all of them there has been a gradual moving away from the original scheme. This is particularly true in Canada, where the influence of the United States has been strong. In Canadian cities, for example, the mayor is elected by popular vote and is usually a paid official with important functions. Some Canadian cities likewise have adopted the city manager plan of government and in most of them there are independent boards or commissions, after the American fashion, in direct charge of such municipal services as police, parks, schools and public utilities.

Modern municipal government in Germany begins with the reforms of Baron vom Stein in Prussia in 1808. For two centuries prior to that time local self-government existed only in the few surviving free cities. The municipalities of

Prussia were governed by burgomasters and councilors chosen from a select class of citizens—those who owned property or had inherited the right to vote. In many cases the king appointed the important officials of the cities, which became mere administrative districts for the central government. The comprehensive Prussian municipal code of 1808 extended the municipal suffrage and gave the voters the right to elect their own local officers, who were to manage the affairs of the cities subject to a definitely limited supervision by the higher authorities.

During the ensuing century there was a steady tightening of central control over the municipal authorities. Prussia moreover adopted in 1853 a curious system of suffrage known as the three-class system, under which the voters were divided into categories according to their annual tax payments; and each of these classes elected one third of the membership of the city council. The council in turn chose a burgomaster for a long term of years, sometimes for life. It also selected a group of paid and unpaid magistrates, to whom the administration of the various city departments was entrusted. The three-class system precluded any control of the municipal authorities by the great mass of the voters, since two thirds of the city council's membership was elected by the heavy taxpayers. In the period of great municipal progress in Germany from 1871 to the World War the German system of municipal government gained a high reputation for efficiency.

The revolution of 1918 made radical changes in the basis and structure of municipal government. The Weimar constitution required that universal, equal, direct, secret suffrage and proportional representation be established in all municipal elections but left other features of the municipal system to the various states. The new municipal codes framed by the states differ considerably from one another. There are three distinct types of municipal organization in Germany with many variations. The strenuous efforts of the *Deutscher Städtetag* (League of Cities) to secure the adoption of a uniform municipal government act for the entire Reich have not yet borne fruit.

In most of the Prussian provinces the pre-war system of magisterial government (*Magistratsverfassung*) has been continued with some important changes. Under this system the voters elect a municipal council, which serves as the policy determining branch of the government

but has nothing to do with administration, which is under the direct supervision of magistrates elected by the council. Some of these magistrates are paid (professional) officials chosen for twelve-year terms; others are unpaid (lay) and serve for the term of the council, usually four years. A paid magistrate presides over each of the regular city departments, assisted by an unpaid colleague and usually by a deputation or administrative committee made up of magistrates, councilors, other city officials and some private citizens chosen for the purpose. Collectively the board of magistrates (*Magistrat*) has the important power of appointing all subordinate city officials, whose qualifications are determined by the general laws. Decisions of the council require the consent of this board, but if such consent is refused there are rather elaborate ways for resolving the difference. Cities with this magisterial type of government also have a chief executive officer known as the burgomaster, chosen by the city council with the approval of the higher state authorities for a term not exceeding twelve years. The burgomaster is chief of the magistracy and the coordinating head of the city administration. He assigns the several magistrates to their respective departments and he has a limited veto power over actions of the city council, but he makes no administrative appointments on his own responsibility.

A second type of municipal government, which may be called the mayoral type (*Bürgermeisterverfassung*), exists in the Rhine provinces and to some extent in Westphalia. At the head of the government is a burgomaster, chosen by the elective city council. In addition to the powers possessed by the burgomaster under the magisterial type of government he has all the administrative powers of the *Magistrat* itself. He is assisted by a corps of executive subordinates, who are elected by the council for six or twelve-year terms.

Finally, in some of the south German states, including Bavaria and Württemberg, the conciliar form of government (*Stadtratverfassung*) prevails. A municipal council, elected by the voters, not only determines all questions of general policy but takes immediate charge of all administrative functions. In the smaller cities the work is performed by council committees as in the English boroughs, but in the larger municipalities the council elects salaried officials to perform administrative functions and sometimes to sit and act with it. The council also

elects a burgomaster, who presides at its meetings and carries out its instructions but who has no independent executive functions.

For Berlin a special form of government was devised in 1920 by a Prussian statute which created the municipality of Greater Berlin with an area of about 350 square miles and a present population of over 4,000,000. The central government of Greater Berlin was organized on a magisterial basis as in most other Prussian cities. There were also twenty boroughs, or administrative districts (*Verwaltungsbezirke*), each with its own framework of local administration. A revision of the structure of Berlin's government in 1931 was intended to accomplish a greater centralization of control in the burgomaster as opposed to the *Magistrat* (see METROPOLITAN AREAS).

In France the municipal system differs considerably from those of Great Britain and Germany. Before the revolution of 1789 there was no French system of municipal self-government; the 40,000 communes, ranging from little hamlets to large cities, were governed in haphazard fashion by the king's appointees, many of whom had purchased their posts. The revolution reorganized French local government and placed it on a basis of self-determination. Every village, town and city in France was directed to choose its own officials by manhood suffrage, and the central authorities were enjoined to keep their hands off. This new freedom was badly abused, however, and in 1795 the government of the communes was brought more closely under central supervision. When Napoleon Bonaparte came into power he continued the process of centralization, providing that all municipal officers should be appointed, not elected. The French system of local government since Napoleon has been made more democratic by republics and less democratic by kings, but the centralization which he established has never been greatly relaxed. The city authorities are regarded primarily as the agents of the central government and are under the control of the central authorities.

The term commune in France includes everything that would be called a municipality in the United States. Marseille is a commune, as are Bordeaux, Toulon and Lyons; so is every little town and village. There are now about 38,000 communes in France, some with fewer than fifty inhabitants, others with several hundred thousand. All are governed under the provisions of the same municipal code. The only important

difference is that the larger communes have larger municipal councils and some additional administrative machinery.

The government of the French commune is a relatively simple affair. Except for Paris and Lyons, each commune has a municipal council of from 10 to 36 members. These councilors are elected for a six-year term and serve without pay. Voting is on a manhood suffrage basis; women have not yet been admitted to voting rights in any French election. The municipal council is the dominating factor in the government of the commune, for it not only makes the appropriations but elects the mayor, his assistants, or adjoints, and all other high officials of local administration. The mayor and his assistants are chosen by the council from within its own membership. They hold office during the same term as the councilors and while they serve as executive officers of the commune, continue to be members of the council, the mayor acting as its presiding officer.

Although the mayor of the French commune is not an independent administrative officer like the American municipal executive, he is by no means a figurehead. On the one hand, he is the local agent of the national government and as such is responsible for the administration of the laws and regulations relating to police, public health, finance, the census and military service. The higher authorities may suspend or remove a mayor if he fails to carry out their instructions in these fields. On the other hand, the mayor is the chief executive of his commune and in this capacity follows the instructions of his municipal council. He prepares the budget for submission to the council, promulgates decrees in accordance with its resolutions and tries to keep the administration running smoothly. A close supervision of his work, however, is exercised by the prefect, a nationally appointed officer who is at the head of the *département* in which the commune is located.

Paris like London, Berlin and Washington is under a special dispensation. The city covers almost the entire department of the Seine and is governed from the prefecture. Unlike the other eighty-nine departments of France, however, Paris has two prefects—the prefect of the Seine and the prefect of police. The latter has the function of maintaining law and order. The former is the dominating factor in Parisian government, and like all other prefects he is the dependable agent of the national government. Both prefects are appointed by the president of

the republic upon the advice of his ministry. Paris also has a municipal council of 80 members, 4 from each of the twenty *arrondissements*, or districts, into which the city is divided. With the addition of certain members from communes just outside the city this municipal council serves also as the general council of the department of the Seine.

Paris has no mayor in the American sense, but the administrative heads of the *arrondissements* are known as mayors. In reality they are sub-prefects appointed by the national government. The Paris municipal council votes the budget and has some other important powers, but it does not control the city administration. The council meets regularly four times a year, but extra sessions, which may be called whenever necessary, occupy most of the intervening periods. At all sessions the two prefects have the right to be present and to be heard. The council maintains a considerable number of committees, which investigate and advise but which have no direct control over the various municipal services.

In Italy as in France the basic unit of local government is the commune, of which there are now about 7300. Prior to 1926 each Italian commune had an elective council and a *sindaco*, or mayor, who was chosen by the council from among its own members; in that year both the councils and mayors were abolished in all communes with a population of less than 5000 and by subsequent decree of the same year in the larger communes as well.

The chief officer of the commune under the present extreme centralization is the *podestà*, who is appointed by the crown on recommendation of the minister of the interior for a term of five years and may be removed by royal decree at any time. The *podestà* has acquired all the powers formerly vested in the *sindaco* and the municipal council. He is responsible for the maintenance of public order and security in his commune; he prepares the local budget and virtually fixes the municipal tax rate. He is directly responsible to the national government for the administration of all municipal services and is therefore under the strict control of the prefect of the department in which his commune is situated.

Rome has been under a special regime since 1925. Its mayor and elective council were then abolished and replaced by an appointive municipal organization consisting of a governor, 2 deputy governors and 10 rectors, all named by

the crown on the advice of the ministry. The governor, assisted by his 2 deputies, is virtually the *podestà* of Rome, while the rectors serve as the heads of the various municipal departments and services. A consultative council of 80 members, who are appointed according to a procedure set by law, has advisory functions only.

In Spain the system of municipal government before the revolution of 1931 was modeled on that of France but with a somewhat larger measure of decentralization. Each commune had an elective council with broad powers and an *alcalde*, or mayor, usually chosen by the council from its own membership; in the larger cities two or more deputy mayors were similarly chosen. In Madrid and Barcelona the mayor was named by the king at his own will, and in certain of the more important cities by the king from among the elected members (*concejales*) of the municipal council. The executive officials did their work under the close supervision of the civil governor of the province, who represented the central authorities. The powers of this civil governor over municipal affairs were broadly analogous to those of the French prefect. The new Spanish constitution which was adopted following the revolution of 1931 assured the municipalities a large measure of home rule but did not greatly change the framework of municipal government. The old Spanish system has been generally copied by the various countries of Latin America, in all of which a rigid measure of supervision over the affairs of the cities is maintained by the central government through the intermediary of provincial governors or officials of somewhat like status.

The three most important cities of Latin America, being capitals of their respective countries, are governed under special dispensations. Mexico city is part of the federal district of about 575 square miles which, since 1928, has been administered directly by the federal government, the tangle of federal, district and municipal authorities having been replaced in that year by an executive department similar in general status to the other executive departments of the federal government. The chief of the department is appointed by the president of the republic. The seventeen municipalities, formerly independent, were converted into departmental divisions (*delegaciones*), with heads appointed by the chief of the department and approved by the president. The separate elective municipal councils were abolished and the fed-

eral Congress became the legislative body for the district; provision was made, however, for a purely advisory council consisting of representatives of the various organized interests in the district. Rio de Janeiro has a prefect, appointed by the president of Brazil. Immediately under him are seven directorics or administrative boards, which have charge of the various municipal departments, such as public works, public health, finance and education. The police are under the immediate control of the president. There is a municipal council of 24 members elected by the voters of the city. Buenos Aires has as its chief executive an *intendente*, or mayor, appointed by the president of Argentina with the approval of the Senate. An elective city council of 30 members has considerable authority with respect to municipal finance, public health and public works, but the administration of police and fire protection is exempted from its jurisdiction.

In the Union of Soviet Socialist Republics each of the component states is assumed to be free to determine its own system of municipal government, but all have followed the same general lines. In the Russian Socialist Federative Soviet Republic the present system of city government rests on the municipal decree of 1925, which sets up as the chief organ of municipal government in each city, large or small, a city soviet, or council of delegates, elected annually on a vocational basis. Shops, factories, institutions and military organizations serve as units for election purposes; unorganized elements, such as housewives, vote on a territorial basis. A law of 1928 permits ward soviets in cities with over 100,000 inhabitants; smaller cities may also establish such soviets with the approval of the central authorities. The city council, the basis of representation in which varies with the size of the community and which in the larger communities is made up of several hundred members, exercises a variety of legislative and executive functions, elects a presidium of 12 members from its own membership and in addition maintains various permanent committees or commissions with administrative functions. It also chooses the municipality's representatives to the next higher soviet. Regular meetings are held once a month, and there are provisions for special meetings. The presidium serves as a collegial city executive; in addition each committee chooses a bureau of at least 3 members to direct the activity of the committee. To a very considerable extent administration is conducted

by subsections of departments of the next higher soviet, but the director of the subsection is appointed by the city soviet subject to approval by the executive committee of the soviet immediately superior. The activities of the municipal authorities are rigidly supervised and are limited to those expressly permitted by the higher soviets. A further large measure of strict control is exercised through the machinery of the Communist party, which is the only legal party and which ties the various authorities together and insures hierarchical accountability.

In Japan under the Tokugawa regime considerable local self-government was accorded the free towns, which exercised these powers through elective assemblies. In the three largest cities, however, the central government retained almost complete power and there was practically no local self-government. After the restoration a system of municipal government with prefectural control modeled on the French scheme was established for all municipalities. Each municipality has an assembly of from 30 to 48 members elected for four years by all citizens over twenty-five years of age. In the cities there is also a municipal council composed of the mayor, the deputy mayor or mayors and from 10 to 15 members elected by and from the assembly. The mayor, who is both chief executive of the city and local administrator for the central government, is elected by the assembly. Other salaried city officials, including the deputy mayors, are elected by the municipal assembly on the recommendation of the mayor. The work of municipal administration is carried on by these officials and by the municipal council subject to the general instructions of the assembly and under the surveillance of the prefect and the home minister.

Municipal self-government in China is a recent revival of a very ancient practise. The first modern municipal code for all Chinese cities was promulgated in 1921. It provided a frame of city government similar to that existing in France, with an elective council, a mayor chosen by it from among its own members and a system of close supervision by the district or provincial authorities. Because of internal troubles this plan was not put into operation, and in 1928 the Nanking (Nationalist) government substituted a new code for application within the territories controlled by it. With various modifications made in 1930 this plan has been carried into effect on a limited scale. Each chartered city is entitled to have a mayor, an admin-

istrative board and an advisory council. The mayor is appointed by the higher authorities. The administrative board is made up of the mayor, his immediate assistants and the heads of city departments appointed by him. The advisory council is the only elective organ and it has no mandatory powers; but all important matters must be laid before it for discussion before final action is taken.

India has no uniform system of municipal government; each province, presidency and native state has its own plan of municipal organization. In general the English model has been followed, with a council which is largely elective and which chooses a mayor as its presiding officer. But in some of the larger cities (e.g. Bombay and Madras) the chief executive is appointed by the provincial authorities, and in Calcutta the chief administrative official is not the mayor but an official whose position is somewhat like that of a city manager, and who is chosen by the council subject to approval by the provincial government. Special representation in the council is sometimes given to business organizations, such as the Chamber of Commerce or the Mill Owners' Association. In the smaller cities a great deal of the administrative work is performed by council committees, but the larger municipalities depend more heavily upon their permanent officials. In general municipal government is largely administered by natives, with some Europeans in technical positions.

The history of municipal government in the United States is of shorter duration but of greater complexity than that of England. On the Atlantic seaboard in colonial times there were a number of chartered boroughs, each of which had received its status from the colonial governor as the representative of the crown. The government of these boroughs was in the hands of a council made up of a mayor, aldermen and councilors all sitting together. In most cases the councilors and as a rule the aldermen were chosen by the people, but the mayor was usually appointed by the governor of the colony.

After the revolution borough charters were granted by the state legislatures. The suffrage was gradually widened and the local officers were made more directly accountable to the whole body of citizens. Election of the mayor by popular vote supplanted the method of appointment by the governor. Administrative work was performed by committees of the council, but as new problems arose this system proved unsatis-

factory in the larger communities. Accordingly the practise developed of giving the management of public works, water supply and similar departments to boards of officials especially chosen for the purpose and wholly independent of the council. Likewise the mayor soon obtained the power to veto the council's acts and in due course was also empowered by city charters to appoint the various administrative boards and officers. By these successive steps during the first half of the nineteenth century power over administrative affairs was being shifted from the council to the increasingly strong municipal executive. This redistribution of authority was hastened by the spread of the spoils system, which demoralized the city council and made it essential that patronage be taken out of its hands.

The typical city government in the United States during the middle decades of the nineteenth century was a reproduction in miniature of the federal system. Each city had a mayor elected by popular vote, usually for a term of one or two years. In addition each had a board of aldermen and a common council, which sat separately, each acting as a check upon the other. Municipal ordinances and appropriations required the consent of both chambers; the mayor could veto their actions, but his veto might be overridden by a two-thirds vote of both chambers. The mayor appointed most of the city's higher administrative officials, subject to confirmation by a majority of the aldermen. Various city departments were under the immediate supervision of boards, the members of which were either elected by popular vote or appointed by the mayor. Provision was frequently made that each board should be a bipartisan body, and as the members of these boards were usually unpaid, they endeavored to get as much patronage as possible into their own hands.

Under this complicated scheme of city government inefficiency and waste pervaded American municipal administration, especially in the larger municipalities. Municipal elections were everywhere conducted on a partisan basis; appointments and contracts were freely utilized to build up the party machine, and the spoils system operated without restraint. Positions of high responsibility were brazenly bestowed upon local politicians as a reward for partisan service.

This condition of affairs continued for several decades after the Civil War with disastrous results in most of the larger cities, where rings and bosses obtained control of the government. These were the days of the Tweed ring in New

York, the gas ring in Philadelphia and of less notorious groups in many other cities. Money was spent with a free hand, city debts were pushed far up into the millions and valuable franchises were given away to public utility companies without proper return. Large amounts of public funds were spent year after year without proper planning or adequate safeguards against corruption, so that considerable sums went into the pockets of officeholders, contractors, ward bosses and their friends (*see* MACHINE, POLITICAL; CORRUPTION, POLITICAL).

Attempts to check these abuses made relatively little progress for many years, mainly because the reform campaigns were undertaken with no more fundamental or ultimate aim than that of replacing corrupt officials by honest ones. Occasionally the reformers succeeded in making such changes; but the competent and honest officials found themselves unable to accomplish much during their brief interludes in power, since they were hampered by the complicated system of checks and balances which city charters had set up in an endeavor to prevent official crookedness.

Municipal reform therefore did not advance appreciably in the United States until the opening years of the twentieth century. At that time it entered a new era by directing its assaults not merely against corrupt officeholders but against those complications of city government which made good administration virtually impossible under any political regime. The new reform movement demanded home rule, simplification of city government, elimination of party designations from the ballot and the introduction of business methods into municipal administration.

In 1901 a new type of city government, known as the commission plan, made its appearance in Galveston, Texas. Its origin was due to the need for reconstructing the city after its partial destruction by a tidal wave. Under this plan all the functions of government, both legislative and administrative, were vested in a commission of 5 elected at large by popular vote. The commission was vested with authority to enact the municipal ordinances, vote the appropriations, fix the tax rate and make all appointments. Individually each commissioner took charge of a designated group of municipal functions, such as public works, finance or public safety. Although established to meet a temporary emergency, this plan of city government proved to have substantial merits for permanent use and

it soon spread widely, gaining a foothold in several hundred American cities. In its actual workings, however, it soon disclosed serious defects. It provided a five-headed municipal executive, with the result that dissensions frequently arose within the commission and important business became unduly delayed.

A modification of the plan, known as the commission manager or council manager type of government, was initiated in Dayton, Ohio, in 1914 (*see* CITY MANAGER). Under the new arrangement all legislative and executive functions continued to be vested in a small body of commissioners or councilors elected at large, but the members of this body no longer assigned administrative duties to themselves. The commission or council was required to appoint a supervising administrative officer known as the city manager, upon whom devolved all functions of a purely administrative character. This plan also gained a wide vogue, particularly in smaller cities, but in some large municipalities as well; it has apparently diverted to itself the strength of the commission plan movement. The results of the city manager plan have been regarded as quite satisfactory on the whole, although much has depended upon the competence of the individual manager and upon the political traditions of the community. The National Municipal League officially advocated this plan in its Model Charter of 1916.

With the spread of the city manager plan, and largely attributable to the same recognized needs, has gone a movement to strengthen mayoral powers in those cities which have retained the older forms of government. Almost everywhere the tendency has been to concentrate a larger amount of independent executive authority in the mayor's office by giving him the sole right to appoint and remove the heads of municipal departments and by bestowing on him a larger degree of authority in connection with the framing of the municipal budget, the approval of contracts and the vetoing of acts of the city council.

Much confusion has resulted from the fact that city and county authorities often endeavor to function over the same area. A metropolitan city sometimes covers nearly the whole of a county, as do Boston, Chicago and Cleveland; New York spreads over five counties or boroughs. In such cases the county officers frequently exercise authority over various public institutions, such as prisons, poorhouses or hospitals, within the city limits. Overlapping juris-

dictions have resulted in considerable friction, needless expense and profitless duplication of effort. In some cases consolidation of the city and county governments has eliminated these difficulties (*see* COUNTY-CITY CONSOLIDATION).

The municipal organization of New York, which covers an area of 320 square miles, is based on the city charter of 1901, somewhat modified by the home rule charter law of 1928. The city's chief executive officer is a mayor, elected by popular vote for a four-year term and removable by the governor of the state on charges after a hearing. The mayor appoints all the higher administrative officials except the comptroller, who is elected by the people. No confirmation is required. He has the right to veto any ordinance or resolution of the Board of Aldermen, but, except in certain cases, this veto may be overridden by a two-thirds vote. If the vetoed order involves the expenditure or borrowing of money or the levying of an assessment, a three-fourths vote is required to override it; if the grant of a franchise is involved, the mayor's veto is final. The mayor is presiding officer of the Board of Estimate and Apportionment and has three votes in that body.

The Board of Estimate and Apportionment is made up of 8 members: the mayor, the comptroller, the president of the Board of Aldermen and the presidents of the five boroughs. The first three have three votes each, the presidents of the boroughs of Manhattan and Brooklyn have two votes each, while the presidents of the other three boroughs (Queens, Richmond and the Bronx) have one vote apiece. The Board of Estimate and Apportionment prepares the annual budget for submission to the Board of Aldermen, authorizes transfers from one appropriation to another, grants franchises, regulates the pay of city officials and employees, passes on all proposed public improvements and serves as the upper chamber of the municipal legislature.

The Board of Aldermen consists of a president, who is elected by the voters of the entire city, the 5 borough presidents and 65 aldermen elected from aldermanic districts every two years. This lower chamber of the municipal legislature makes, amends and repeals the ordinances; it has a general control over water rates, traffic and building regulations and markets. It may reduce or eliminate controllable items from the budget but may not insert or increase them, and its actions in any event are subject to veto by the mayor.

The borough presidents are elected for four-year terms by the voters of their respective boroughs. They have charge of local highway and sewer work, the care of certain public buildings and the enforcement of building regulations and appoint the officials in charge of these activities in their boroughs. Each borough is divided into districts with local improvement boards made up of the borough president and the aldermen from the district. The borough president also appoints the members of the local school boards within his borough, but the school system of the city as a whole is administered by a Board of Education, the members of which are appointed by the mayor.

Like other national capitals Washington—officially the District of Columbia—is under a special dispensation. Governed from 1801 to 1871 by a municipal government elected by popular vote and from 1871 to 1874 as an organized territory with its own legislative assembly, the capital is now administered directly by the federal government. Its administration is vested in a board of three district commissioners, two of which are appointed by the president with the consent of the Senate and must be residents of the district. The third is an officer detailed by the president from the engineer corps of the army. These commissioners make practically all appointments to the administrative staff; they supervise the local public services and have power to make ordinances. But the appropriations for carrying on the government of the district are made by Congress and a large part of the cost is paid from the national treasury. The balance is raised for the most part by local taxation. The city accounts are treated as accounts of a branch of the United States government. Congress legislates directly for the district and some of its municipal functions are performed directly by federal agencies. The government of Washington thus represents a much greater degree of centralized control than is to be found in any other of the world's leading capitals. It is the only capital of a democratic country in which the residents are completely disfranchised.

The administrative mechanism of cities everywhere consists of a series of functioning departments, e.g. police, fire protection, public works, finance, poor relief, public health and education. In cities of the United States each department is usually headed by a commissioner or superintendent, but in some cases by a board. Appointments to these positions are customarily made

by the chief municipal executive but are subject to confirmation by the city council in some cities. Council committees have general charge of municipal functions in English cities while adjoints, or deputy mayors, are entrusted with such control in France. Administrative departments are usually divided into bureaux, among which the various departmental functions are allocated. These bureaux in the larger cities are further subdivided into sections or offices. Municipal officers except the heads of departments are appointed in French, German and many American (but not in English) cities under civil service regulations with qualifications prescribed by law. In the United States a few cities have established personnel departments, which perform the function of preparing these eligible lists. The dismissal of any official or employee who has been appointed under civil service regulations must usually be preceded by the filing of charges and a formal hearing.

The rapid expansion of municipal functions and the increased complexity of municipal administration have made necessary the adoption of more businesslike methods by all municipal departments in all countries. Centralized purchasing, better accounting procedure and the scientific management of municipal properties have been generally adopted by the larger cities everywhere. Checks upon corruption and waste have likewise been made more effective. Since several departments may require the same general kind of service, for example, legal advice or engineering counsel, it has become the practise in larger cities to maintain central staff departments which render a certain service to all branches of city administration. It is the duty of the chief executive, whether city manager, mayor or burgomaster, to coordinate all branches of this mechanism; and in the performance of this duty his influence over municipal expenditures is of prime importance.

To insure the use of the most advantageous methods of administration some cities in the United States have established efficiency bureaux or bureaux of municipal research to scrutinize all branches of city business and to make suggestions for improvement. In other cities this work is done by privately supported research organizations, which are assumed to represent the taxpayers' interest. Strong pressure in the direction of improved business methods in city administration has been exerted all over the world by such organizations as chambers of commerce, boards of trade, ratepayers' associa-

tions, better government leagues and local reform groups.

There has been relatively little cooperative activity among cities in the United States. Local pride and intermunicipal rivalries have prevented development in this direction such as has taken place in European countries, particularly in France. American cities moreover do not generally keep their accounts, as European cities do, in such form that their respective operations are comparable, although uniform municipal accounting is now being required by law in a number of the states. The lack of a common denominator for determining relative efficiency has been one of the serious handicaps to municipal economy.

The discussion of common municipal problems, however, has been facilitated by leagues of municipalities and similar bodies in various countries. These organizations, in which the cities are represented by their higher officials, provide a forum for the interchange of ideas as well as an agency through which any common cause of the cities can be jointly furthered. Most particularly these organizations strive to represent the interests of the cities in matters of legislation before the national and state legislatures of their respective countries. Likewise there are leagues, organizations and associations which concentrate upon particular branches of city administration, such as public health, poor relief, sanitation, engineering and city planning. On a nation wide scale the National Municipal League and the American Municipal Association afford channels for the discussion and promotion of civic well being in the United States. Similarly the *Deutscher Städtetag* in Germany provides an unofficial parliament for the larger cities and enables them to present a united front in safeguarding their right of home rule. The *Reichsstädtebund*, or National League of Cities, performs a similar service for the smaller municipalities. Somewhat similar organizations exist in England and in France, while the *Union Internationale des Villes et Pouvoirs Locaux* seeks to further the same ends on an international scale. To the stimulation of interest in municipal affairs, alike among officials and laymen, these organizations have made important contributions.

MUNICIPAL TRANSIT is a recent development in the world's history; before the nineteenth century the poor walked and the rich traveled in their privately owned, horse driven carriages. Because cities were small and men lived close to their work there was no need for the elaborate municipal transportation facilities of modern times. But with the coming of the factory system and the drawing of people from the countryside urban populations and the area of cities increased. Moreover the smoke, dirt and noises of the factories stimulated in men the desire to make their homes at some distance from their places of work; this in turn created a need for a regular mode of cheap mass transportation. The growth of trade and commerce likewise was a factor in hastening the development of municipal transit.

STREET RAILWAYS. The first American passenger street car, which was drawn by horses over strap rails laid on stone ties, dates from November 26, 1832. But actually very little progress in street railway service was made until the last thirty years of the nineteenth century. In the United States, for example, 117 roads were built between 1832 and 1870, while 652 roads were added from 1870 to 1890. The inadequacies of the horse car led to experimentation with improved forms of power driven vehicles. In 1873 the cable car was perfected, but before it could be introduced generally the electric railway had proved its superiority. In 1887 the first successful electric railway was placed in operation in Richmond, Virginia; this year marks the beginning of the phenomenal development of the municipal railway industry throughout the world. Table 1 shows the growth in the United States over the period 1890-1927, in terms of miles of single track.

From the very beginning municipal transit

has been a recognized public utility subject to regulation by governmental agencies. The requirement by street cars of rights of way over public highways has justified public authorities in stipulating conditions as to quantity and quality of service and fares. Again, municipal transit is the type of economic enterprise which can best be provided by a monopoly. The universal practise therefore, wherever private companies furnish municipal transit service, has been for governmental agencies to grant monopoly privileges, usually by means of franchises, or charters. Probably some of the most shameful chapters in American annals are concerned with the bribing of legislators and city councils by business interests anxious to obtain trolley franchises. Thus one body of New York City's aldermen will always be known as the "Boodle Board of Aldermen" because of the huge bribes its members accepted for giving away the surface use of the city's streets without properly protecting the public's interests. This board in 1884 granted a perpetual franchise for the operation of a car line along Broadway, one of the most lucrative routes in the city, to a company controlled by one Jacob Sharp, who had been trying unsuccessfully to obtain the grant for more than thirty years. On the ground that the city could obtain at least \$1,000,000 for the franchise from other and responsible groups the measure was vetoed by the mayor but was re-passed over his veto. Public indignation was aroused and a resulting legislative investigation disclosed that all but two of the twenty-two aldermen had received \$22,000 each for voting the franchise. The legislature annulled the grant, but the state Court of Appeals held that the franchise was a contract which could not be revoked by legislative act. Trolley cars are still operating on this line in accordance with the terms of the perpetual franchise.

In recent times the old practise of giving private corporations permanent rights to the streets has passed away, and it is now customary to grant short term franchises with a life usually of ten to twenty-five years. Frequently the

modern franchise contract gives the city authorities the right of termination if the conditions of service are not lived up to. Both short term and terminable franchises serve notice upon the companies that unless they satisfy the public their activities will be cut short. As we shall see later, the transit problem would be much less difficult today if this policy had been pursued from the very beginning. For example, many cities could replace electric railways with modern buses, but perpetual or very long term franchises render this impossible without the consent of both the stockholders and bondholders of the railway companies. These, to protect their investment, refuse to yield except on the most onerous terms to the city. Few cities in the United States can truthfully say today that their citizens are provided with proper transportation facilities. The street railway industry since 1918 has been one of the sick industries of the nation. Because of meager earnings its credit position has been very weak and new capital has not been attracted. The results have been that antiquated and obsolete cars have not been scrapped and track extensions and rerouting of track locations to take care of population growth and shifts have not been made.

Before the World War a prevailing five-cent fare in most of the cities of the United States and Canada yielded enough revenue to make the electric railway business a profitable one. With the rise in operating expenses during the war period, however, and with the refusal of public officials to countenance an increase in fares fixed by contract, revenues fell off sharply. Beginning with 1920 fares were raised—the average fare in the United States in 1933 was 7½ cents—but this did not materially improve the financial position of the railways. The higher fare merely caused a falling off of traffic; this in turn raised the unit cost of carrying each passenger. People chose to walk rather than pay the additional charge, this being particularly true in the case of the profitable short hauls.

Some cities, notably Cleveland, Cincinnati, Dallas, Rochester and Montreal, tried to meet the problem by the so-called service at cost franchise. Under this plan fares were adjusted to provide sufficient income to meet operating expenses plus a fair rate of return, generally 6 percent on an agreed valuation. A city official was assigned to supervise operations completely. But the new device has failed for the same reason that higher fares have not substantially bettered the financial condition of the street railway

companies. The frequent controversies between the municipal authorities and the companies as to the adequacy of return and the legitimacy of certain operating expenses have been other factors in preventing cities like Chicago, Milwaukee, Denver, Minneapolis and Syracuse from adopting the plan.

Investors have recently shown little confidence in the ability of the street railway companies to meet fixed charges, with the result that throughout the post-war period electric railway bonds sold for \$20 to \$30 less than par value. The depression only made matters worse, so that in 1932 these bonds were selling at about 30 cents on the dollar. Restored confidence in electric railway securities is essential if municipal transit systems in the United States are to get the money to finance necessary capital improvements. One obvious method of realizing this objective has not been tried; that is to say, the deflation of existing capital structures. At first new investment might be frightened off, but gradually confidence would be restored as it became clear that the electric railway companies of the country had reduced the volume of interest charges necessary for old investments in order to make earnings available to pay interest on new investment. The federal census reports show that the funded debt of electric railways in the United States declined only 2.6 percent from 1922 to 1927. In the former year it was \$2,134,331,939; in the latter it was \$2,078,048,415. The interest on the funded debt increased from \$98,572,192 in 1922 to \$99,161,939 in 1927. This was the period when financial reorganization should have been carried on on a gigantic scale.

The private companies owe such reorganization to the public because of their unsound financial practices in the past. Many capital structures have been heavily watered since the early 1900's, when there was no effective governmental regulation of new security issues. In the pioneer days of transit it was the rule to award franchises to innumerable companies for short routes. With the coming of electrification huge new capital investment was required. But because the small companies did not have access to the long term capital markets, holding companies were created by financiers to buy them up. These holding companies sold their securities to the public and with the proceeds purchased the stocks and bonds of the operating companies. It is true that without this service the rapid development of municipal transit

would have been impossible; nevertheless, the use of this financial method resulted in great abuses. The organizers of the holding companies capitalized future earnings, which never were realized, by the issuance to themselves of stocks and bonds which represented no actual investment. One of the outstanding examples was that of the Metropolitan Traction Company, organized in 1886 by a number of Philadelphians, of whom P. A. B. Widener, Thomas Dolan and W. L. Elkins were the leading spirits. This group first gained control of the surface railways of Philadelphia and other cities and then, joined by William C. Whitney and Thomas F. Ryan, turned their attention to New York City. Here they quickly succeeded in consolidating all the surface lines in Manhattan and the Bronx, making huge fortunes for themselves in the process. For example, the holding company acquired control of a railway on Thirty-fourth Street worth \$100,000 and issued \$2,000,000 in stocks and bonds secured by this property. The Metropolitan Street Railway Company, likewise controlled by this group, was compelled to pay \$2,000,000 in cash for these securities and in order to get the money had to sell its own stocks and bonds. In a similar case, that of the Twenty-eighth and Twenty-ninth Street lines, \$3,000,000 of securities were issued for a property worth \$250,000. In these operations the promoters got the cash while the public was forced to pay interest and dividends on millions of dollars of securities representing no physical investment.

The electric railway companies moreover, in accordance with the traditional practise of privately owned and operated utility corporations, failed in more prosperous days to retire a part of their funded debts from profits. This should have been a well established policy, especially in an industry witnessing such rapid technological changes. But it was not done, and the result is that today interest is being paid on bonds of which the proceeds were used to provide equipment long since scrapped and replaced through subsequent bond issues. Interest charges, in other words, were pyramided without substantially increasing revenues through the tapping of new areas and the provision of additional facilities.

A deflation of capital structures would of course require the consent of the bondholders, who have the rights of a first mortgagee upon the properties. It is to be expected that this group will resist such a proceeding as long as fixed

charges can be earned. These the companies have earned, but not much more. In 1927, for example, the ratio of earnings to fixed charges for all the electric railways of the United States was 1.36. Total dividends paid were \$32,796,405 on capital stock, with a balance sheet valuation of \$1,451,808,639, or about 2.25 percent. Obviously new money will not come into an industry which barely yields a return on existing bond investment and such a small return on the common stock. Here and there, where fixed charges have not been met, the companies have gone into receivership and financial structures have been reorganized. In 1919 the high point in bankruptcy was reached, for in that year forty-eight companies with a capitalization of \$634,000,000 and a single track mileage of 3781 were in the hands of receivers. By 1929 these companies in receivership had dropped to five with a capitalization of \$74,000,000 and 425 miles of track, only to mount once more by the end of 1931 to seventeen companies with a capitalization of \$81,000,000 and a mileage of 1308.

Spokesmen for the private companies, opposed to deflation of capital structures, have advocated a reduction in operating expenses through wage cuts. To strengthen the point they call attention to the index of street railway wages, which in June, 1932, stood at 218 percent of the pre-war basis. But the argument is disingenuous in view of the fact that the index is based on the average hourly wage and therefore does not take into account the cuts made over the past three years in operating schedules and working time. The fact is that in 1927, according to the federal census, the average weekly wage received by conductors was but \$33 and by motormen but \$35; since then this average wage has dropped considerably.

Over wage cutting hangs the threat of complete disruption of service in view of the proved militancy of street railway labor. Some of the most bitter strikes in American labor history have been fought by these workers. After the war there broke out all over the United States a series of street railway strikes for the purpose of forcing wage increases; these strikes were accompanied by great physical violence and destruction of property. This is not difficult to understand in view of the facts that the electric street car readily lends itself to destructive tactics and the character of street railway work has been such that it attracts and breeds a sturdy and fearless type of employee. Even though the street railway workers have never been more

than 30 percent organized, the weapon of the strike enabled them to double their pre-war wages. In 1927 the industry employed 239,000 wageworkers; in 1931, 91,400 street railway workers were organized in the Amalgamated Association of Street and Electric Railway Employees of America.

From a number of points of view transit is a service logically to be undertaken by local governments. In the first place, transit is intimately bound up with the whole problem of city planning, for it has been demonstrated again and again that population inevitably follows transit facilities. For this reason if a municipality owned and operated all the transit lines and was seeking to redistribute its population in order to relieve congestion, it could build new routes into undeveloped areas, using the profits of the paying lines to carry the losses of the new ones. In the second place, the credit of the municipality could be utilized to provide new capital for necessary improvements without cost to the taxpayer. While the fare would be established at a point to yield enough revenue to meet operating expenses and fixed charges, a sizable saving could be effected through the city's ability to borrow money at a lower rate of interest than can private enterprise.

A number of cities in the United States and Canada, notably Detroit, Seattle and Toronto, have successfully solved their transit problem through municipal ownership. Detroit, for example, acquired all of the trolley lines in the city in 1922 at a cost of approximately \$5,000,000; even before that date the municipality had embarked upon a program of new track construction because of the inability of the private companies to obtain financing. From 1920 to June 30, 1932, at least \$35,000,000 was spent by the municipality in providing additional facilities and new cars. Besides, where the density of traffic was not heavy enough to warrant trolley operation, buses were put on the streets. The result has been that Detroit has one of the best equipped and most efficient transit systems of the country. Municipalization has been successful from other aspects as well: the average fare is only 6½ cents as compared with an average fare of 7½ cents for the country; the fiscal year ending June 30, 1932, showed a surplus of \$31,183; not only were there no deficits to be made up from the city funds but the municipal transit system paid \$829,000 in taxes; and the wage rate paid was higher than that prevailing among private companies. Detroit's system is operated by the

Department of Street Railways headed by two commissioners, who are appointees of the mayor.

Toronto's story is somewhat similar. In 1921 the city took over the private street railway system at a cost of approximately \$12,000,000. In addition and with the aid of the public credit, the city has spent \$35,000,000 in constructing many miles of extensions and replacing antiquated cars with the latest and most improved equipment. Although the average fare is but 6½ cents, operating revenues have been more than sufficient to meet all expenses, including fixed charges. In 1931 Toronto's municipal transit system closed its fiscal year with a surplus of \$13,605. A commission of three, appointed by the city council and known as the Toronto Transportation Commission, is responsible for operation.

In the light of this record it is interesting to note how few American cities have sought for the solution of their transit problems in municipal ownership and operation. The 1927 federal census reported but 20 municipal railways with a total track mileage of 933, as against 682 private companies operating 40,695 miles. There are several explanations for this state of affairs. In the first place, in the United States there is a general distrust of government in business because of the generally low standards of public administration. Of course, parenthetically, it might be pointed out that it would be difficult for the municipalities to do much worse than the private traction companies. In the second place, many states cannot give cities the power to own and operate their own transit facilities without amending state constitutions. That this is generally a lengthy and tedious process is proved by the case of Detroit, where it took thirty years to obtain the necessary legal power for municipal ownership. Again, the existence of long term or perpetual franchises is a difficulty. Companies are not likely to give up their franchises and properties except at exorbitant prices, a procedure bound to handicap future municipal operation by passing on an unbearable burden of interest charges. Seattle, Washington, for example, by paying \$15,000,000 for properties worth only \$8,000,000, was forced to increase fares to meet deficits.

In Europe, on the other hand, municipal ownership and operation are much more widely accepted. In the United Kingdom, Norway, Sweden, the Netherlands and Italy ownership and operation by local authorities predominate.

A compilation made by the Ministry of Transport for the United Kingdom in 1928 showed that of 221 tramway undertakings 73 percent were owned and operated by local governments. The capital expenditure of the municipal enterprises was £81,574,000 for 1812 route miles of system; of the private companies, £18,925,000 for 608 route miles. Also the gross receipts of the municipal undertakings for 1928-29 were £23,293,000 as compared with £3,775,000 for the private companies.

In Germany there has been a tendency toward private operation with public control through majority ownership of the stock. In 1925-26, the latest figures obtainable, there was in the Reich a total of 149 systems, of which 110 were under the auspices of the local governments, 35 were owned by private companies and 4 by municipalities and private companies jointly. Of the 110 in the first group but 60 were directly operated by the city governments; 26, although municipally owned, were managed by a private company specially incorporated for the purpose; and the remaining 24 were administered by mixed companies in which public and private funds were represented. In the last case the local authorities generally owned the majority of the stock, which entitled them to a majority of the directors and therefore power over policies. The city of Berlin furnishes an excellent illustration of this form of organization. It bought up the majority of the stock of the transit corporations operating within the city and today has complete control over all trolley, bus and rapid transit facilities. As a result a system of free transfers has been introduced under which a passenger can change from one type of conveyance to another and on payment of a single fare of 6 cents travel up to a maximum of 22 miles. The various transit systems are coordinated under a commission of sixteen, made up of eight members of the board of aldermen, four persons representing the city administration, two citizens acquainted with transit and two employees of the operating companies. The advocates of this type of management believe that it combines the best features of both public and private enterprise. In the first place, it enjoys the advantages of cheap and easy municipal credit; secondly, it has the flexibility and efficiency of private management; and, thirdly, it insures managerial policies responsive to public needs.

Many European cities make money from their tramways and these surpluses go toward the support of municipal social services, such as

education, hospitals and the like. In 1926-27 a large number of German cities derived in all one seventh of their income from municipally owned and operated utilities. In recent years the British tramways, over and above the regular taxes of approximately £1,000,000 a year which they have been paying, have contributed more than £200,000 annually toward the support of local governments. In addition they have been spending about £1,600,000 annually for the paving of the roadways over which they run. The sound policy of retiring debt has also been followed. For example, the 161 municipal tramway systems of the United Kingdom had by 1929 redeemed or set aside for redemption £47,285,000 of a total paid in capital of £85,284,000. The 60 private companies, on the other hand, had redeemed or set aside for redemption but £1,274,000 of a total paid in capital of £20,909,000. The municipal tramways, in short, have done eight times as well in retiring their debt as have the private lines. The result has been generally throughout Europe with the possible exception of France, where the government is frequently called upon to make up deficits, that municipal transit systems have not suffered from the severe reverses which have characterized the recent history of the American electric railway industry.

It is to be noted too that European fares are lower than those in the United States. This is to be accounted for by smaller wages, greater density of cities and shorter hauls. Some typical flat fares are as follows: Berlin, 6 cents; Amsterdam, 4 cents; Milan, 2½ cents; Rome, 2½ cents. In London, where the zone system is employed, 1 cent is paid for the first 1.2 miles, 4 cents for 2.4 miles, 6 cents for 3.6 miles and 8 cents for 4.8 miles. The zone fare, which is fairly typical of a great many English cities, furnishes an inducement for short haul riders who otherwise would walk. The British have also experimented with other types of fares, notably the cheap mid-day fare. To encourage more riding between the hours of 10 a.m. and 4 p.m., when traffic is naturally lighter, the London County Council has introduced a 2-cent fare for a 2-mile ride and a 4-cent fare for a ride from the suburbs to central London. In addition working men get reduced rates. This fare structure has worked out very well in recent years and the London County Council Tramways, for the fiscal year 1929-30, showed a surplus of almost \$200,000. Lower rates for working men are also to be found in many continental cities.

MOTOR BUSES. In recent years it has increasingly been argued that the street electric railway is doomed, largely because it is so poorly adapted to the automobile age. Most cities of the United States as well as the larger municipalities of Europe have been wrestling with very serious problems of traffic congestion caused by the increased use of the automobile and the motor truck. There is no doubt that the trolley car impedes the free flow of traffic. For example, every time a trolley car stops to take on or unload passengers all motor vehicles directly behind it must stop. Moreover it is often dangerous for passengers to find themselves in the middle of the street for the purpose of getting on and off cars as motor vehicles stream by. The bus, because it is not fixed to a track, has the advantage of being able to pull up to the sidewalk, while other motor vehicles pass on the left. On the other hand, the defenders of the trolley car contend that the street railway is far superior to the bus in thickly settled areas because it is more economical and efficient for mass transportation. But they are willing to concede the usefulness of the bus in less densely populated areas, where the traffic does not warrant a heavy capital expenditure for tracks and conduits or overhead wires.

Efforts have been made to prove the superiority of the street railways. Thus in Liverpool a study indicated that if buses were substituted completely for tramways, 880 buses would be required to take the place of the 640 trams used in the rush hours—an increase of 37.5 percent in the number of vehicles. Also a survey made by the Canadian Electric Railway Association of the amount of road space per hour occupied by various types of vehicles during the rush hour in a typical Canadian city showed that 5.9 square feet were required for a trolley car passenger, while 18.7 square feet were required for each bus passenger. The advantage of the trolley car over the bus could be corrected only by the design of a motor bus capable of carrying a larger number of passengers.

These claims, however, are far from conclusive. A British royal commission, after an exhaustive survey of the transport problem, reported in 1931 that "tramways, if not an obsolete form of transport, are at all events in a state of obsolescence, and cause much unnecessary congestion and considerable unnecessary danger to the public. We recommend, therefore, (a) that no additional tramways should be constructed, and (b) that, although no definite time limit

can be laid down, they should gradually disappear and give place to other forms of transport." The record shows that, regardless of theoretical arguments, the bus is displacing the electric railway. By 1931 eleven English cities had completely changed from electric to bus transportation, while in a great many other cities substitution was already in progress. In the United States the same process is taking place. Although the bus did not develop commercially in the United States until after 1920, by January 1, 1932, 259 cities in 40 states were served entirely by buses.

In addition the electric railway companies, with the exception of the municipal railways, have virtually ceased building lines into newly developed areas. Instead the companies have applied for bus franchises for these routes. This is reflected in the figures for miles of electric railway track and of bus route operated by trolley companies. In 1920 the electric railway companies of the United States operated no buses; ten years later they were operating 24,296 miles of route and 11,827 buses. In the same period the route mileage of street railways declined from 44,000 to 36,000. The same tendency is discernible in European cities. The daily number of bus passengers in the four German cities of Berlin, Stuttgart, Chemnitz and Königsberg increased from 5,351,000 in 1927 to 8,340,000 in 1930, or 56 percent.

Even in the large congested cities, where trolley operation should presumably be a superior form of transportation, the ascendancy of the bus is apparent. In London buses carried 49.1 percent of the total traffic in 1928 as compared with 27.1 percent by the tramways. Although the tramways are operated by the London County Council, the buses are privately owned and operated. This situation is illustrative of the lack of planning in the development of municipal transit facilities. In the early 1920's when the bus was still in an experimental stage, individuals could buy buses, obtain a certificate from the police certifying to the safety of the equipment and operate them wherever and whenever the owner saw fit. They would appear on the streets during the rush hours and take traffic away from the tramways, which, as a result, began to sustain severe financial losses because it was obligatory for them to furnish services when traffic was also light. This situation was corrected in 1924 when the Ministry of Transport was empowered to compel buses to maintain regular schedules and to order them

off routes adequately served by tramways. London's transit problem, however, has not been solved. Without common ownership it is impossible to obtain a perfectly coordinated and integrated transit system. London's difficulties are complicated still further by the fact that its underground system is likewise privately owned.

In New York City there has been under way for some years a movement to supplant the trolley with the bus. The New York Railways Corporation, which operates 32 route miles through some of the densest portions of Manhattan, has offered to surrender its permanent trolley franchises for a bus franchise—on very onerous terms, however. These have included: franchises for six short haul crosstown routes already being served by operators with temporary permits; payment of but 5 percent of gross revenues for these routes; payment of but 1 percent of gross revenues during the first ten years on all the routes where trolleys would be replaced by buses; the city to pay street repavement costs. No agreement has been reached on this basis.

RAPID TRANSIT. No discussion of municipal transit can be complete without an analysis of the rapid transit situation. The great metropolitan areas of the world cannot depend solely upon electric railways and buses. These in huge cities covering large areas are satisfactory for short hauls but much too slow for conveying passengers from homes in outlying districts to offices and factories in the heart of the city. The distances to be traversed are too great for ordinary transit facilities; hence the need for rapid transit.

Although New York City's first elevated line was opened in 1870 and the first subway in the United States was operated in Boston in 1897, progress in providing adequate rapid transit facilities has been painfully slow, both in the United States and Europe. The total mileage of elevated single track in the United States in 1927 was 634; of subway and tunnel, 342. New York City had approximately 60 percent of the elevated mileage and 82 percent of the subway mileage. Table II shows the mileage of subways and elevated lines in those American cities which can lay claim to possessing something of a rapid transit system.

Rapid transit lines are laid out to carry great numbers of people. In 1931 despite the smallness of rapid transit track mileage, as compared with trolleys and buses in American cities of 50,000 population and over, 2,092,300,000 pas-

TABLE II
MILES OF SINGLE TRACK IN SUBWAY AND ELEVATED SYSTEMS, AMERICAN CITIES, 1927

CITIES	SUBWAY SYSTEMS	ELEVATED SYSTEMS
New York	281.72	373.00
Chicago	—	178.66
Philadelphia	9.20	32.19
Boston	29.38	25.63

Source: United States, Bureau of the Census, Census of Electrical Industries, 1927, *Electric Railways and Affiliated Motor Bus Lines* (1931) p. 23. The original table presents these figures by states; the cities cited are, however, the only ones having rapid transit facilities.

sengers out of a total traffic of 8,738,700,000 passengers were carried by rapid transit facilities. Detroit, St. Louis, Chicago, Los Angeles, Boston and Philadelphia have in recent years appointed commissions to work out plans for the construction of needed rapid transit lines, particularly subway routes; new elevated construction, while considerably cheaper, is now regarded as impracticable and undesirable. The reports of these commissions have been favorable, but little new building has taken place recently except in New York City and Philadelphia.

The difficulty is largely financial, for modern subway construction is very expensive. Thus it cost New York City \$11,500,000 to build a mile of subway along Eighth Avenue. For this reason and because there is a long period of building during which no return is earned on the investment (it took eight years to complete the Eighth Avenue Subway, which New York City opened in 1932), private capital has never been able to finance subway construction on a large scale. There are two exceptions: the so-called "Hudson Tubes," which run from Thirty-third Street in Manhattan to Jersey City, New Jersey, and the London Underground Railway. Generally subways have been built by municipal governments; just as generally they have been turned over to private companies for equipment and operation. The chief reason for private operation has been the fact that subways as a rule have been built to connect with elevated lines also run by private operators. The New York, Boston, Philadelphia and Paris subways are excellent cases in point.

New York City, most of whose subways were built between 1900 and 1920, had an investment, as of June 30, 1930, of \$386,000,000 in a dual subway system operated by two private companies, the Brooklyn Manhattan Transit Corporation and the Interborough Rapid Transit Company. The companies, exclusive of their elevated lines, invested \$325,000,000, the bulk

of it being spent on equipment and the reconstruction of the elevated roads so that the trains could go directly from the subway to the elevated. The terms of operation and the relations between the city and the company have been defined in four contracts, each running for fifty years. From many points of view the contracts did not sufficiently protect the public's interest. Thus under these contracts the city can get next to no return on its money until the companies have collected annually a total of some \$25,000,000, representing the prior lien of the elevated roads, and interest and amortization on the private subway investment. If in any year these company preferentials are not earned, they become cumulative and are deductible from revenues before the city can collect interest and amortization on its subway bonds. The result has been that the city has collected very little money on its subway investment because of these prior liens on earnings. In 1932 there was due to the city \$228,000,000 under the contracts; and approximately \$16,000,000 a year must come from taxes to pay the fixed charges on the old subway bonds.

The cry of the taxpayer for relief has intensified the drive for municipal ownership and operation of the subways. For more than a decade negotiations have been in progress looking toward purchase by the city of the private companies; a fair purchase price would be \$350,000,000 in city bonds at 4 percent. It has been felt that a reduction in capital costs such as this together with the economies possible as a result of unified operation would enable the city to meet the bulk of the fixed charges on the subway bonds and at the same time preserve the 5-cent fare. But the companies' insistence on excessive prices for their properties has until now blocked all hopes for agreement. Aside from the question of meeting capital charges New York is interested in its rapid transit problem for another reason. It is in process of completing a new \$700,000,000 subway system, part of which is already being operated by the municipality itself; and unification (with its conveniences of a single fare and through travel) is out of the question so long as three systems, one operated by the city and two by private companies, are maintained.

Boston's rapid transit system is a combination of public and private ownership and public operation. The subways, with the exception of the Cambridge Subway, were built by the city between 1897 and 1916 and then turned over to

the Boston Elevated Railway Company for operation. In 1918 the private operator went into bankruptcy and there was set up in its place a committee of five trustees appointed by the governor of the state. The state law providing for public operation also guaranteed the holders of the common stock of the private company a 6-percent return and underwrote the city subway bonds. Within a year it was necessary, in order to keep the system self-sustaining, to raise the fare by gradual stages to 10 cents. In 1931 the guaranty was reduced to 5 percent.

The use of public funds for the construction of subways does not in itself solve the financial problem, for the cost of new building has become well nigh prohibitive, at any rate on the basis of a practicable fare. Construction costs since the pre-war period have doubled; the immense growth in underground conduits and pipes, required for telephone, gas, electricity, water and sometimes steam service, causes the additional expense of relocating these facilities without disrupting service; in the large cities traffic congestion is so bad that municipal authorities cannot afford to close the streets during the long period of construction, and therefore large sums of money have to be spent in decking the street with heavy timber after excavation so that motor vehicles can continue to ride on it. Therefore, even if a city has no legal limitation upon its borrowing power and has ready access to the capital markets, the burden of fixed charges is very great. The result would be a very high fare, certainly at least 15 cents in cities the size of Boston, Philadelphia, Detroit and the like, if the new subway is to be self-sustaining. It must be apparent that with such a marked increase in fare traffic will fall off and unit costs will increase enormously. Indeed such was the experience of Boston when the subway fare was doubled.

It is necessary therefore to shift part of the cost of construction from the rider to some other group. The commissions that have studied the problem in various cities have generally recommended that one third of the cost be transferred to the general property taxpayer, another third to the property especially benefited through close proximity to the new subways and only one third to the rider. There is great merit to the proposal in normal times. Rapid transit inevitably raises land values and results in very large unearned increments to property owners. According to a study made in 1908 by the City Club the first New York City subway, which

cost \$43,000,000, added \$80,000,000 in value in seven years to one section of the Bronx and Manhattan. According to a study made by the City Affairs Committee the Eighth Avenue Subway, also in New York City, added \$17,000,000 to the value of only some sixty blocks of property along the route. It is interesting to note that this rise in real estate took place during 1924-30, while construction was still going on; also that the unearned increment of the property in question was equal to fully 80 percent of the cost of construction of the particular strip of subway which had brought it about.

This proposal of placing part of the cost of subway construction upon real estate interests likely to benefit specially from the improvement has not yet, however, been transferred from the realm of debate; because of this and the lack of an equally reasonable method of financing, rapid transit construction in the great metropolitan centers of the world is proceeding at a snail's pace. Indeed New York's population is fortunate in that its rapid transit needs were provided for to the extent they were before the crisis in financing became apparent. In 1930 its subway and elevated lines carried two thirds of the total municipal transit traffic. But London and Berlin, both of which resemble New York in that they are spread over vast areas from which their populations are compelled to travel great distances to reach places of work, are not so happily situated. In 1928 London's rapid transit lines carried but 24 percent of the total traffic; in 1929 the proportion for Berlin was 18 percent. Since the depression construction in both these cities has been at a standstill; in London, as has been pointed out, the situation is further complicated by the facts that existing rapid transit facilities are privately owned and operated and that private capital is unable to finance the necessary extensions.

TAXICABS. In recent years the growth of the taxicab has created a new problem for municipal authorities. In 1930, 19,500 taxicabs in New York City carried 346,000,000 passengers, at a total charge of \$144,000,000 including tips. This sum was almost equal to the \$160,000,000 in fares collected by all forms of mass transportation in the city. But despite the magnitude of its operations the taxicab business has been made to submit to public regulation of only the loosest character. The customary supervision has consisted merely of examinations of the personal record of the individual applicant and of the physical fitness of his machine. Permits to

operate have been forthcoming upon the satisfaction of these simple requirements.

Naturally this lack of adequate municipal supervision has resulted in grave abuses. For one thing, it has led to an oversupply of licensed taxicabs, with the result that almost every city has large numbers of empty cabs which cruise in search of passengers and therefore increase traffic congestion. Thus the Fifth Avenue Association of New York City reported that a count on March 27, 1930, revealed that 2095 empty cabs passed by one Fifth Avenue corner between 10 a.m. and 5 p.m. Again, wasteful competition and duplication of facilities are just as unsound practises in the taxicab business as in other forms of transit. Wages are depressed because the available revenues must be distributed among an unnecessarily large number of drivers; potential profits that might go to the city for the use of its streets, if taxicab operation were conducted on a franchise basis, never materialize because of excessive operating costs.

Public officials therefore are increasingly being persuaded that taxicabs should be regulated in the same manner as other forms of transportation. The usual programs advanced contain the following items: first, taxicabs should be limited, through the issuance of certificates of convenience and necessity, to the number necessary for adequate service; second, they should not be allowed to cruise at will but should be compelled to maintain hack stands located at strategic points in the hotel, theater and other districts where the demand for cabs is greatest, and these stands should be accessible by telephone; third, an expert governmental agency should be charged with the responsibility for supervision.

Already a trend in the direction of regulation has become evident. In Connecticut the Public Utilities Commission has the power to grant or deny to taxicab operators certificates of convenience and necessity, and it has used it. In Montana, Pennsylvania, Arkansas and Rhode Island similar steps have been taken. In Detroit the mayor has been given the power to determine the number of cabs, the fares to be charged and the like. Cities with similar regulations are Cincinnati, Los Angeles, Akron, Chicago, Grand Rapids, Jackson (Michigan), Milwaukee, Minneapolis, Norfolk, Racine, Roanoke, St. Paul, San Francisco, Tacoma, Toledo and Washington.

It is not unlikely that most cities will eventually adopt the comprehensive franchise principle

for taxicab operation, for it is much easier to control the rates, service and equipment of one operator than of many. Besides under a franchise the city can fix compensation for the use of its streets. In Grand Rapids the local transit company has a monopoly franchise which includes taxicab operation; in Philadelphia the same situation prevails. In support of this type of unified service it is argued that the profits of the taxicabs can be used in helping to carry the less profitable street railways.

MUNITIONS INDUSTRY. From the early economy of primitive tribes, among whom there was little differentiation between articles of daily use and implements of war, there developed handicraft manufacture of defensive and offensive weapons. The sword and armor industry of the Middle Ages did not progress beyond this stage, even when it produced for export. The making of powder and cannon also remained essentially handicraft arts, even when comparatively large quantities of gun barrels were cast or forged in a short time and the iron used for the guns was obtained from mines organized on a primitive capitalistic basis. As late as the age of absolutism the slight demand for munitions was filled in a far from uniform manner. A minor portion was supplied by state factories while the rest came from plants leased by the state to entrepreneurs who employed workers under a contracting-out system or was obtained by occasional large purchases abroad, depending on how the requirements could best be met at any given time. Amsterdam was noted as a source of muskets, while many cannon came from Stockholm. The French and Swedish ordnance works of the eighteenth century were largely in the hands of the higher nobility, who made large profits from them.

The establishment of armament manufacture as a special branch of fully developed capitalist production of considerable economic and political importance occurred largely during the second half of the nineteenth century. In this period the increasing technical precision required in the material supplied and the large accumulations of capital needed for mass production led to the elimination of most of the small plants and the concentration of production in the few plants in each country which were able to turn out high quality armaments under modern conditions. Constant technical advances in the industry and the rapidity with which types of arms change heightened the competition still more and increased the number of industrial casualties. Further development along

this line led inevitably to a tendency toward monopoly within each important country.

Ordnance works have always played a leading role in the munitions industry, while small arms plants have risen to prominence only occasionally, although they sometimes grow into large concerns with considerable political influence and economic importance, as in the case of Mauser, Ludwig Loewe and the Berlin-Karlsruher-Industriewerke under the management of Paul von Gontard. Rifle factories have, however, found it increasingly difficult to obtain positions of importance without affiliation with ordnance works. The munitions industry as a whole, in spite of its political importance, constitutes so small a fraction of the total of big industries that as a national economic factor its significance is relatively small in time of peace.

The founders of the modern munitions industry did not start out with the intention of becoming armament industrialists. Some, as in the case of Ehrhardt, Alfred Nobel, Armstrong, Andrew Noble, Whitehead, Maxim and Zaharoff, entered it as the result of inventions which proved useful in warfare or simply in search of profits. Others, such as Krupp, Schneider, Vickers, Skoda, Whitworth, Carnegie, Schwab and Harvey, originally owned industrial plants manufacturing articles of peacetime use and turned later to munitions, for which their plants were peculiarly adapted.

The link between the development of war material and the manufacture of peacetime products often developed out of the parallel increase in standards of quality which marked the latter half of the nineteenth century. Those ordering both sorts of material repeatedly required that large orders be turned out extremely quickly and with the highest precision. The same material was used in the manufacture of big guns as was employed for many high quality peacetime products. The manufacture of propeller shafts, rails and car wheels was among the first big problems of the steel industry simultaneously with the manufacture of steel ingots for big guns and the forging of armor plate. A number of the older munitions works therefore made both high quality railroad material and war material.

War and peacetime production had other points of contact than quality standards. Important items of peacetime steel production automatically served war uses as well. The propeller shafts on fast steamships propelled armed auxiliary cruisers in time of war; and since rail-

roads have played a part in military operations since the German-Danish war of 1864 and the American Civil War, car wheels and rails are also indirectly war material. From the end of the nineteenth century onward wartime and peacetime production have drawn closer and closer together. All general staffs were deeply interested in the evolution of the early automobile into a usable motor truck. Radio telegraphy cannot be differentiated at all in practise into war and peace telegraphy. The chemical industry has been drawn into the manufacture of war material to such an extent that there is no longer any chemical industry that is not a munitions industry as well, while in the manufacture of airplanes and airplane motors the last difference between production for war and peacetime purposes has vanished. In plants of this sort peacetime production may outweigh production for war purposes or vice versa. It is a question not so much of the quantity of each kind of production as of their relative importance to the plant. Even though approximately 60 percent of Vickers' total production for 1913, for instance, was for peaceful purposes, the plant nevertheless bore the stamp of a specific munitions concern.

As the development of the munitions industry has thus gained impetus from peacetime industrial advances, so industry in general has been helped by lessons drawn from wartime experience in munitions work. Developments in the munitions industry during the World War, for instance, threw much light on labor problems, hours, wages, welfare and the hitherto largely unrecognized possibilities of woman's work in new fields. The nature of skilled, semi-skilled and unskilled grades of work was brought out also. The possibilities of industrial progress through the encouragement of science, notably chemical science, were clearly revealed by the war, while engineering skill and knowledge received a great impetus.

From the beginning of the munitions industry in the modern sense to the 1890's was not a period of ordinary competition between firms turning out similar products, but was rather one of bitter struggle between two ordnance systems and a race between guns and armor plate. The two competing methods of ordnance manufacture up to the World War were the Armstrong wire wound process and the Krupp shrunk hoop process. Both of these processes emerged during the 1850's and were the starting points for the growth of the largest British and German

munitions firms. In the most embittered competition each firm endeavored to secure orders for the artillery of its own country and to drive its competitor out of the latter's home market. Armstrong succeeded in obtaining the contracts for the British navy, but only for a short time, until technical changes made him wholly dependent on the foreign market. By the use of a very high grade, although extremely expensive crucible steel, Krupp secured the Prussian army contracts fairly easily and was able to retain this monopoly until the appearance of the Ehrhardt recoil barrel gun. Krupp's prolonged but finally unsuccessful opposition to the adoption of the recoil barrel cost that firm world leadership in field gun construction, although it did not affect its rank as a designer of heavy artillery and armor plate. In the design of field guns Schneider-Creusot took the lead.

The other great nineteenth century armaments contest was between guns and armor plate. In the naval armaments race of the 1860's France and England developed seaworthy and serviceable armored frigates, the *Gloire* in 1859 and the *Warrior* in 1861, followed by other ships with increasingly heavy armor and bigger guns. This race between guns and armor was based upon a purely mechanical increase in the thickness of iron armor and a similar rise in cannon caliber without any improvement in the quality of either, until the giant 45 cm. guns could no longer be serviced and the ships could not carry the masses of iron armor plate. The nature of the contest changed during the 1880's when the gun caliber was reduced in favor of improved quality, while a more complex method of manufacture—compound and all steel plates—took the place of simple iron armor. After a short interval, when the Harvey hardening process was employed, the race in its initial form was settled by Krupp's cemented armor plate in 1893. This finally came into such universal use that in the battle of Jutland both the British and German fleets were equipped with Krupp armor plate.

Toward the end of the nineteenth century with these conflicts settled, the movement toward concentration in the munitions industry which had begun in the 1850's took on added impetus. The invention of smokeless powder to take the place of black powder gave the explosives factories a new importance in armaments. In 1886 Alfred Nobel amalgamated his world wide dynamite and powder interests into the Nobel Dynamite Trust Company, Ltd., in

London, directly controlling the international explosives trades.

Shortly thereafter the move toward concentration began in the British munitions industry as the monopoly positions of the older firms were broken by newer competition. Because Armstrong had raised the prices of guns and Brown and Cammell that of armor plate, both lowering the quality of their products at the same time, the Admiralty aided the development of the Vickers firm, which had a talented ordnance designer in Lieutenant Dawson. It made an improved all steel armor plate instead of the compound armor plate, while it strengthened its financial position for big munitions orders by raising its capital from £150,000 to £750,000. A few years later in 1891, the Admiralty allowed a fifth firm, William Beardmore and Company, Ltd., to participate in the armor plate bidding. The battle between these firms ended with large scale mergers. In 1897 Armstrong absorbed the independent Whitworth armor plate plant, Vickers bought up the Maxim-Nordenfeldt works, and Brown the Clydebank shipyard. Immediately after Sir William Armstrong's death Zaharoff, the director of Vickers, put through the biggest merger ever made in the munitions industry, bringing together Vickers, Armstrong and Beardmore. Vickers abandoned gun manufacture, Armstrong gave up the production of armor plate and Beardmore was relegated to a subordinate position in the shipyards of the trust through the purchase by Vickers of a controlling interest in its capital stock. A competing concern of smaller size, the Coventry Ordnance Works, was formed to dispute the field with this giant merger, but the Zaharoff group was able entirely to exclude its new competitor from the building of big warships up to 1910. In the few remaining years before the outbreak of the World War the Coventry works did considerable business, particularly in the expansion of the Russian fleet, but it was unable seriously to threaten the supremacy of the Zaharoff group.

Compared with the tremendous concentration of the English munitions industry under Zaharoff's control the Krupp concern took second rank in size and capacity, although it too had abandoned the sole manufacture of ordnance in the 1890's and developed into a producer of all kinds of armament material. In 1893 it bought up the Gruson works in Magdeburg, which specialized in the manufacture of armored turrets for foreign countries, and began the manufacture of Krupp armor plate. In 1896 it ab-

sorbed the small Germania shipyard in Kiel and a machinery plant, expanding them into big establishments. Internationally, however, Krupp was far outdistanced by the Zaharoff group. Its comparative weakness was further increased by the leasing of its patents in 1902 to the financially insolvent Skoda works, which were turning out very poor cannon. Skoda gradually got control of the Austrian market, but it failed completely in its efforts to penetrate the Balkans. Krupp was forced further and further back in the construction of warships and the production of ordnance, while the German yards' share of warship orders for foreign countries diminished accordingly. Just before the outbreak of the World War Krupp lost another of its most important markets, Turkey, to the Zaharoff group.

In the United States in the meantime the munitions industry had been developing along somewhat different lines. Here it was most markedly an outgrowth of already existing industrial organizations so that the typical European "armament king" was altogether absent. The numerous little blast furnaces and iron smelters that cast cannon and cannon balls during the Revolutionary War and the small local powder manufactories of the same period did not attain economic or political importance. The Civil War gave rise for a time to large scale production of war material, but no permanent munitions industry grew out of it, because the American army and navy ordered neither guns nor ships for half a generation after the war. Only when the United States began to build its modern fleet in 1886 were contracts given to big plants. Guns were ordered from the Midvale Steel Company—which later entered into bitter competition for armor plate orders as well—while guns and armor plate were ordered from the Bethlehem Iron Company (later the Bethlehem Steel Corporation). When Hayward Augustus Harvey, president of the Harvey Steel Company of Newark, New Jersey, invented the Harvey process for hardening armor plate in 1890, the Carnegie steel plant also began to manufacture armor plate. In the United States ordnance works have usually been merely departments of big steel plants. As the American interest in armament manufacture came later than it did in Europe, the process of concentration was delayed. It was not until 1913 that the Bethlehem Steel Corporation bought up a yard in which big battleships could be built even to the smallest detail.

The years immediately preceeding the World

War were a period of tremendous activity for the munitions industry, as both great European alliances were building up their military and naval establishments. The outbreak of the war caused no change in this situation at first, for all countries thought they could get along with the available material or with the productive capacity of the existing plants. Not until 1915 did it become fully apparent that the war would be a long drawn out struggle, enlisting all the resources of the continent, rather than a short, sharp campaign ending in sudden victory for one side or the other. Extensive expansion of war production then began, transforming all the industries of the belligerent countries into munitions industries. At the start the governments treated the munitions industry as a private party to a contract, as had been the case before the war, but it was soon found that this newly created giant machine required new forms of organization and management, representing a cross between governmental and private ownership in all countries, and giving the state an unprecedented degree of control over production, prices and labor policies.

The munitions establishments on both sides were utterly unprepared for the tremendous demand for guns and ammunition of all kinds and for the production of the new weapons developed during the war. In the beginning Germany suffered from this shortage less than did the Allies. The German general staff was less dogmatic than the French about the length of the war and consequently had larger reserves of material. Nevertheless, Germany too lacked sufficient munitions for some months after the battle of the Marne. The high development of its metallurgical industries, however, and the care taken at the time of mobilization to retain the necessary workmen in the war factories enabled that country to begin the production of munitions on a sufficient scale some time before the Allies were in a position to achieve the same result. It was only when the allied blockade began to shut off essential raw materials and German labor began to be restive that the German munitions enterprises lagged.

France was less well prepared. By the end of August, 1914, the supply of munitions began to run short. The effort to produce on a large scale was handicapped by the fact that the Germans had occupied that part of France which was richest in metallurgic industry and by a shortage of skilled labor due to the unscientific mobilization which had taken workmen for the

army without regard to their importance to the war industries. The government immediately began to utilize governmental plants to the utmost and at the same time to set private plants to producing munitions. So well did this effort succeed that by March, 1916, France was producing ninety-eight times as many machine guns, two hundred thirty-seven times as many rifles, four and a half times as much powder and twenty-five times as much high explosive as at the beginning of the war.

England likewise entered the war with small reserves of munitions. By the terms of the French alliance its contribution was to be the British navy and a small expeditionary force. When England realized that instead of the latter it would be necessary to raise and equip an army of millions, the seriousness of the munitions problem became apparent. There were only three government factories producing munitions—Woolwich Arsenal, Enfield, for rifles, and Waltham Abbey, the royal gunpowder factory. There was also a group of private armament firms—Vickers, Armstrong, Whitworth, Birmingham Small Arms, Coventry Ordnance Works, Beardmore, Firths, Hadfields and Cammell Laird. These plants were expanded, new ones were built, and private plants which could be adapted to munitions were utilized until by the third quarter of 1918, according to the estimates of G. A. B. Dewar, there were 2,871,000 men and women directly employed in the munitions (metal and chemical) industries; including those indirectly employed Dewar puts the total at 3,400,000, and he calculates that at the period of greatest productivity there were between 8000 and 9000 firms engaged in the production of munitions.

The United States was less ready for the war than any other country involved. Before 1914 there were only six government arsenals and two large private ordnance works which were at all competent to manufacture heavy artillery. Allied orders led to some expansion along this line in the early years of the war, but even in 1917 there were only a score or so of firms turning out artillery ammunition, big guns, rifles, machine guns and other important ordnance supplies. When the Armistice was signed, however, there were nearly 8000 manufacturing plants in the United States working on ordnance contracts.

The end of the World War brought about a complete transformation in conditions within the munitions industry. The Russian industry was freed of western influence and rebuilt and ex-

panded by the Soviet government. Krupp dropped out of international competition but in 1920 it purchased the Bofors ordnance works in Sweden and since then has been supplying foreign countries with guns made in Sweden under its patents. The only plant left in Germany was the Ehrhardt works in Düsseldorf, which Krupp likewise owned for a time, but which was bought by the German government in 1929 after its expansion. The old Zaharoff group also disintegrated. The British munitions industry, which had grown powerful primarily through the mass production of battleships, suffered a serious blow in the Washington Naval Treaty of 1921-22. Vickers and Armstrong both had to be reorganized in 1925-26; in 1927 the munitions plants of both firms were merged into Vickers-Armstrongs, Ltd., with Vickers dominating the new concern. Ansaldo, which had come into prominence during the war, collapsed after hostilities ceased and was maintained only with the aid of state subsidies. Schneider-Creusot became the undisputed leader of the whole continental munitions industry. This munitions plant was expanded into the biggest industrial concern in France with large interests in production for peacetime use. The Skoda works, majority control of which was acquired by Schneider in 1919, was enlarged considerably both for munitions and for peacetime production and became a powerful subsidiary, filling chiefly the orders of the Little Entente. Energetic efforts by the Czechs to nationalize the plant failed in 1930. In the United States the Bethlehem Steel Corporation in 1923 took over its competitor, the Midvale Steel and Ordnance Company, thus obtaining a virtual munitions monopoly.

The political, economic and social problems which arise out of the munitions industry are many. Most obvious, perhaps, are its connections with national diplomacy. Support by the diplomats of its own country has always been extremely important to the industry, and it has obtained this aid regularly, although published diplomatic documents simply omit the material dealing with this subject. The monopolistic trend of the munitions plants has caused the diplomats always to aid the monopoly plant, leaving the outsider without any support. Military missions always see to it that armament material produced in their own country is purchased by the government to which they are accredited. The sovereigns have also carried on vigorous propaganda for their munitions plants.

Wilhelm II took a lively interest in having Chinese warship orders filled in German yards and personally intervened with Czar Nicholas II for the award of Russian warship construction to Germany.

In spite of this close connection with national diplomacy, the munitions industry recognizes no national boundaries. It will sell to anyone who will buy, whether the purchaser be an ally of its home government or a potential enemy. Hans Wehberg declares that in 1915 the English troops in the Dardenelles were defeated by artillery which the Turks had bought from English armament firms. Lehmann-Russbüldt states that "the Krupp works, in the course of a century, exported one-half of its total output of cannon to fifty-two countries which later, during the World War, showered hand-grenades and death-dealing shells on the Germans and their Allies."

The diplomatic relations of the munitions industry are not, however, the only source of the social problems of the industry. Its influence in domestic politics is important also. While the use of lobbying and the exertion of economic and political pressure by munitions makers may not be much greater than similar activity on the part of other industries, the distinctive nature of the armament business makes it a more vital social problem. It does not remain within the purely business sphere, bringing economic distress to classes which are less able to influence the government; it makes its profits partly through speculating on mass slaughter and partly through the slaughter itself. The profits of the individual munitions plants are in startling contrast to the general destruction of values caused by the products which they manufacture.

Appropriations for armaments are often voted, not in the interests of the state as a whole but in the interests of one or more groups. The munitions industry obtains its orders therefore not as a result of the general governmental concern for a national foreign policy, but in consequence of a definite distribution of social and political power within the state. Thus the expansion of the German fleet around 1900 did not have any motivation in foreign policy but took place before any opponent for the fleet had been found. The navy laws of 1898 and 1900 were part of major political and economic conflicts between heavy industry and the big agrarians, who ultimately granted each other a fleet and protective tariffs, coming together for a joint suppression of the social democracy in-

stead of contesting with each other for governmental power.

Particularist interest in expansion of armaments may go as far as in Japan, where naval construction was pushed after 1910 by the business men and industrialists of Osaka and Kobe, by the Zaharoff group, which paid fantastically high bribes, and finally by high navy officers of the Satsuma clan—including Admiral Yamamoto, the prime minister—who were financially interested in the Mitsui works in Nagasaki.

Another problem arises from the fact that the munitions industry does not wait until the interests of the ruling classes provide it with orders; it endeavors to regulate the armaments of the great powers in accordance with its own economic ambitions. Statistics on the number of articles on naval matters appearing in American newspapers indicate a rapid rise during periods of falling iron and steel prices and low shipyard activity, while these articles grow fewer as prices rise and prosperity returns to the industry. When the crisis commenced in Germany after the second navy bill had been passed in 1900, the president of the German navy league, Prince Salm-Horstmar, appealed to Admiral von Tirpitz for a new navy law, because "orders for new warships and the ensuing stimulation of trade and industry would cause the corresponding stock quotations to rise, saving many securities and consolidating the market." In England, after the business crisis of 1907-08 when Germany speeded up naval construction by building four big ships annually instead of three, while British dropped from four in 1906 to three in 1907 and two in 1908, the Zaharoff group and the Coventry works initiated a large scale press campaign, attempting to prove by bold distortion of figures that Germany would soon have more dreadnoughts than Britain. As a result they actually succeeded in having eight dreadnoughts built in 1909. But since the Coventry works out of all this booty was awarded only the gun contracts for a single ship, it was forced in order to avert financial collapse to have its banks grant loans to Australia and New Zealand so that they might order two additional battle cruisers.

This problem arises not only in time of industrial depression but is necessarily bound up with the existence of a private munitions industry working on government orders. Its production depends on two contradictory factors: the industry's interest in accurate cost accounting of production and of capital charges, with uniform

production to reduce costs; and the government's interest in the greatest speed in handling its orders, a number of which are usually awarded at one time. The state requires very short delivery dates in war, but even in peace time new inventions in armament technique result in mass orders for rapid delivery, while there follow long intervals when there are no orders. Thus the munitions plants are forced to expand greatly, while they also endeavor to keep the plants in operation at all times. This leads inevitably to the exertion of constant pressure upon governments to award new orders.

The physical location of munitions plants also has economic and political implications. If they grow out of plants producing material for peacetime uses and still manufacture such products as subsidiary or major output, they must have good industrial locations to enable them to compete successfully. But as munitions plants they cannot take this factor into account; they must be located well away from the frontiers so as not to fall into the enemy's hands in the event of invasion. In spite of their prominence, however, as objects of attack munition centers have never played more than a minor role in strategy. Moltke gave the subject some thought in 1870, but pre-war continental military thinking eliminated munitions centers as objects of attack by concentrating upon rapid and brief operations at the beginning of the war and quick military decisions on the field of battle.

The League of Nations has endeavored to reduce the influence of the munitions industry in politics, but with slight success. The Chinese arms embargo of 1919 was never effective; nor was the St. Germain Convention that no arms would be supplied to revolutionaries. On the contrary the revolutions and undeclared wars of the post-war period have led to a further strengthening of the munitions industry. The Arms Trade Convention of 1925 was signed but never ratified by the required number of countries; and no country is ready to injure its balance of trade by eliminating arms exports. Publication of arms import and export figures is of merely academic interest; the statistics list numerous exports that have never reached the country of destination as well as imports that were never exported from the alleged country of origin. The munitions industry itself is tenaciously fighting any limitation of armaments, especially naval armament, as was brought out in the Shearer case; it would not be much affected by numerical reduction of land forces,

as even small armies require large material reserves in order to expand to war strength.

MUNRO, SIR THOMAS (1761-1827), British statesman. Munro attended Glasgow University and after a short apprenticeship to a merchant entered the East India Company's army at Madras in 1780; from 1792 he served in the civil administration. Before becoming governor of Madras in 1820 he inaugurated British government in several parts of the Madras presidency and in the Bombay district. Throughout his career he remained in close contact with the people of south India, speaking their languages with ease and familiarity. He opposed strongly the extension into Madras of the zamindari system prevailing in Bengal and advocated instead the ryotwari system, that is, the collection of the land revenue direct from the peasant proprietors; this method he believed to be indigenous and moreover one which would provide the collectors with an ever growing mass of information, economic and social, without which a foreign administration could not hope to succeed. Munro is still remembered for his systematization and extension of the ryotwari plan of revenue collection. He adhered to the traditional method of administration through executive officials in opposition to the system established in Bengal, which depended upon a law code ignored by an illiterate population and upon a series of law courts encumbered by an elaborate procedure. As president of the special commission to investigate and reform the judicial system of the presidencies of Bengal and Madras, Munro was instrumental in having the new regulations of 1816 adopted. Among the innovations were the permission to headmen of the villages to decide petty cases, the increase

of the power of native judges, the simplification of judicial procedure and the employment of hereditary village officials as police. Some of these regulations were retained for a long period.

While seeking to establish the company's rule in India upon a sound basis Munro did not, however, regard it as permanent. To him it appeared an episode made necessary by that demoralization of government and society which the breakdown of the Mogul Empire had produced. He looked forward to the time when it would be proper and necessary to hand the government back to Indians and accordingly urged the need of promoting native education and developing higher moral standards. These objects were to be effected by the reorganization of schools and by the employment of Indians in posts of ever rising responsibility in proportion as they proved that they had shaken off their corrupt habits and acquired a new sense of political duty. As governor of Madras, Munro established over three hundred schools and gave grants to existing ones.

MUNSEY, FRANK ANDREW (1854-1925), American business man and publisher. After a poverty stricken boyhood in Maine, Munsey came to New York in his twenties and began the publication of the *Golden Argosy*, a cheap popular monthly devoted chiefly to romantic fiction, much of which he wrote himself. He greatly augmented the fortune obtained from this venture by investment in grocery stores, real estate and banks and by stock speculation.

He later carried his strictly commercial practices over into daily journalism but with little success. He believed in consolidating newspapers to maintain revenue and decrease expenses and bought or established seventeen newspapers in six cities. Of these he suspended three, combined nine with one another and sold six. Munsey's papers were never popular; the circulation which he purchased at a cost of millions rapidly dwindled; he had to draw repeatedly on his large private fortune to continue operations. The chief tangible results of his policy were the dismissal

of hundreds of journalists, often practically without notice, and the opening of the way for new, competing journals nearly always inferior to those which Munsey had killed. Indirectly he had much to do with the rise of the tabloid, and he helped accelerate the process which was transforming journalism from a profession into a business. At the time of his death he owned but two newspapers. It was an ironic conclusion to a futile career that although he had always been quite indifferent to aesthetic pursuits he could think of nothing to do with his fortune except to leave it to the Metropolitan Museum of Art in New York.

MÜNSTERBERG, EMIL (1855-1911), German social worker. Early in his career Münsterberg, a jurist by training, acted first as assistant to the town council of Berlin, and then became interested in poor relief and the protection of youth. As mayor of the city of Iserlohn he gained direct insight into public administration. His efforts in behalf of poor relief acquired particular importance in 1892 after he was called to Hamburg, where he found the distress among the laboring classes greatly intensified by an epidemic of cholera. Here as in Berlin six years later Münsterberg rendered pioneer service in reorganizing the poor law administration. His method, based on the famous Elberfeld system, included a central bureau for information, research, registration and financial administration together with the decentralization of the actual giving of relief through the division of the city into small districts in order to make possible greater attention to individual cases. Wherever practicable public assistance was given in the home and the services of volunteers were utilized. Later Münsterberg introduced professional social workers, trained experts in public relief. Through his visits to the United States as well as through his numerous writings he became the chief interpreter of this system to American social workers.

In addition to his work as a practical administrator Münsterberg founded in 1900 and edited the first professional magazine in the field of German social work, the *Zeitschrift für das Armenwesen*; wrote the first systematic textbook on German charities, *Die Armenpflege* (Berlin

1897); and helped to establish in Berlin the first school of philanthropy. In his "Zur Frage der städtischen Selbstverwaltung, mit besonderer Beziehung auf die englische Lokalverwaltung und ihre neueste litterarische Behandlung" (in *Jahrbuch für Gesetzgebung, Verwaltung und Volkswirtschaft im Deutschen Reich*, vol. xxvi, 1902, p. 1639-89) he embodied his views on city home rule. He participated in the various international congresses for public charities and served as president of the Deutscher Verein für Armenpflege und Wohltätigkeit, later the Deutscher Verein für Öffentliche und Private Fürsorge. From 1905 until his death he was director of the Department of Public Charities in Berlin. Münsterberg's ideas continued to bear fruit after his death and many of his views on the reconstruction of social legislation were realized in Germany after the World War.

MÜNSTERBERG, HUGO (1863-1916), German-American psychologist and philosopher. Münsterberg, son of a Jewish merchant, was born in Danzig and educated at Geneva and Leipsic, taking his doctorate in psychology with Wundt. Later he took a degree in medicine at Heidelberg. After teaching psychology (nominally as a branch of philosophy) at Freiburg i.Br. he was called to America in 1892 through the influence of William James, who secured his appointment as professor of psychology and director of the experimental laboratory at Harvard University. In 1897 after a two years' visit to Germany the appointment was made permanent. During 1910-11 Münsterberg served as Harvard exchange professor at the University of Berlin.

Münsterberg's first important work was a monograph entitled *Die Willenshandlung* (Freiburg i.Br. 1888), in which he criticized Wundt's innervation theory as implying a direct experience of the will. This criticism was subsequently attacked as a misunderstanding of Wundt's position. When he came to Harvard, Münsterberg's

interests shifted from systematic experimental psychology to various new branches and applications of psychology. He was the first to give a course in applied psychology (at Berlin) which included practical demonstrations in hypnotism. He sought and found applications of psychology to medicine, law, industrial efficiency, advertising and various other departments of human endeavor. While much of what he wrote on these subjects was not strictly scientific, his work had the merit of enlisting the interest of practical men of affairs on behalf of psychology. His books moreover were full of fertile suggestions and intuitive flashes which opened up new pathways for laboratory research by more controlled methods.

Münsterberg's philosophy, contained in his *Eternal Values* (Boston 1909), an English version of the *Philosophie der Werte* (Leipsic 1908), *The Eternal Life* (Boston 1905), *Science and Idealism* (Boston 1906) and *Der Ursprung der Sittlichkeit* (Freiburg i.Br. 1889), is a species of voluntaristic idealism, with the chief stress on action. In this respect he harked back to Fichte; yet unlike the German idealists of the nineteenth century he set up a barrier between philosophy and science. In the real world there are purposes; in science, or the world of constructs, there are only causes. From this double system of bookkeeping he derived the conclusion that in actual life man is free but from a psychological viewpoint determined.

MÜNZER, THOMAS (c. 1490-1525), German revolutionary and religious leader. Münzer, a priest, became an adherent of the Reformation and was influenced by Hussite and Taborite ideas while serving as a reformed preacher in Zwickau near the Bohemian frontier. With Nikolaus Storch he spread these doctrines among the Zwickau proletariat until he was expelled in 1521. After living for a short time in Prague,

where Hussite doctrines were still strong, he led a religio-social uprising in Allstedt in 1522. Later in Mühlhausen (Thuringia) together with Heinrich Pfeiffer he established a revolutionary regime closely resembling the Münster collective of the Anabaptists. After being banished from Mühlhausen he wandered throughout Germany, finally playing a leading role in the Peasants' War of 1524-25. Disapproving of the relations of Luther with the evangelical princes and landowners he called for a more basic attack on traditional Christianity as well as for a popular revolution against the feudal ruling class. He endeavored to link the uprising of the Thuringian peasants to social revolutionary movements of urban workers and miners. His program was violently denounced by Luther, and following the annihilation of his forces in the battle of Frankenhausen he was put to death.

Münzer was an outstanding figure in one of Germany's greatest social revolutions. His religious and social doctrines, largely influenced by Huss and Joachim of Flora, were based upon what was later called the theory of the inner light. God speaks through the heart rather than in the dead letters of the Bible. When hearts are full of "the spirit" and men are reborn in the true baptism of God's living word, external laws and compulsory social organization will be unnecessary. Power will be in the hands of the holy. The "godless," who "have no right to live," should be ruthlessly exterminated.

Münzer greatly influenced German political and social thought. Hans Denk, Sebastian Franck and Andreas Karlstadt owed much to him. Radical democratic and social movements of the nineteenth century acknowledged and honored him as their precursor. Ecstatic revolutionary and chiliastic communist groups in Germany after the revolution of 1918 claimed him as their prophet, holding that he anticipated revolutionary developments in Russia and was the peer and prototype of both Liebknecht and Lenin. Münzer's doctrines paved the way for the Quaker doctrine of inner light, for the English Quintomonarchist demand for a dictatorship of the holy and for the chiliastic and enthusiastic communism of Winstanley and Weitling. His Allstedt *Bund* was a forerunner of the English and American covenants.

MURATORI, LODOVICO ANTONIO (1672-1750), Italian historian. Muratori was born at Vignola near Modena and entered the priesthood in 1694. For a short time he was librarian of the newly founded Biblioteca Ambrosiana in Milan. In 1700 he returned to Modena, where for fifty years he was the duke's librarian and archivist. Muratori's life work consisted in the conscious application of the methods of Mabilion and the Benedictines of Saint-Maur, improved by his independence of judgment, to the sources of Italian mediaeval history. This field had been neglected by the scholarly humanistic tradition, which, honoring only the illustrious history of classical antiquity, had generally left the Dark Ages to their darkness. Through the sheer force of his humility, patience and unpretentious love for truth Muratori reversed the prejudice; he published and interpreted more than two thousand chronicles from the period from 500 to 1500. Thus he illuminated a comparatively recent but almost thoroughly hidden past and revealed, among other features of the Middle Ages, the importance of the struggle between the Italian free communes and the empire, in which the Swiss historian Sismondi later sought the pattern of modern liberties. Although in his adolescence he was a pupil of

the Jesuits and throughout his life a sincere Catholic he evinced a firm impartiality whenever he touched upon matters of positive research. Prosecution was initiated against him by the church but was overcome through the interference of political authorities whose protection Muratori enjoyed.

Not rebellious in any sense, Muratori was liberal minded as far as this was permissible within the set up of the acknowledged powers. In his treatise *Della pubblica felicità* . . . (Lucca 1749) he conceived of the state as a paternalism ordered by reason and virtue, solicitous for the bodily welfare and the spiritual improvement of its subjects, lawful, beneficent, wisely tolerant of natural inclinations, neither ambitious, tyrannical nor cruel. Wars Muratori held to be the worst of evils if not necessary for self-defense but promoted by lust for glory and power.

MUSEUMS AND EXHIBITIONS. Although museums can trace a continuous history only as far back as the beginning of the fifteenth century, occasional collections of art works, religious objects and "curiosities" of various kinds existed at a much earlier period. Alexander the Great in the course of his marches and conquests amassed and sent to his former teacher, Aristotle, the materials of a notable collection; and, as is generally believed, Ptolemy Soter, under the inspiration of Alexander's world Hellenizing policy, founded the museum of Alexandria. But these were isolated instances. In the long period between the burning of the Alexandrian library and the beginnings of the

Renaissance Roman trophies of conquest and mediaeval collections of ecclesiastical relics constituted the nearest approach to a museum.

The fifteenth century witnessed the discovery of two new worlds. One was the long obscured civilization of ancient Greece and Rome; the other was America. Aided by the growth of nationalism, these discoveries revived the long dormant intellectual curiosity of western Europe. Materials to satisfy this curiosity were sought with feverish intensity. Kings, princes and nobles sponsored excavations and collected libraries of the classics and objects of classical art in their palaces and castles; explorers and traders brought minerals, plants, animals and other trophies from the East and West Indies and the continent of America; scholars and men of wealth vied with one another in obtaining "rarities" and choice specimens of art or natural history. Thus there grew up throughout Europe art collections, coin and medal collections, natural history collections and collections in which art objects, natural history specimens and mere curiosities were intermingled. By the middle of the sixteenth century there were, according to Murray, nearly a thousand coin and medal collections scattered through Italy, France, Germany and the Netherlands. Notable early collections which formed the nucleus of museums now in existence are those of Cosimo de' Medici in the Uffizi Gallery at Florence; that of Ulisse Aldrovandi, which, joined with the collections of Cospi and Marsili in 1743, is now in the Museo Civico and the university library at Bologna; the Kunst und Naturalien Kammer of Augustus, elector of Saxony, from which developed the museums of Dresden; and the collections of Francis I and his successors in the Louvre.

With the decline of ecclesiastical authority and obscurantism in the period following the Reformation interest in the sciences spread widely. This was heralded early in the century by the founding at Rome of the Accademia dei Lincei, of which Galileo was a member. After the middle of the seventeenth century the movement gathered force, and a strong stimulus was given to the collection and classification of scientific material by the founding of such societies as the Academia Naturae Curiosorum at Schweinfurt in 1652, the Accademia del Cimento in Florence and the Academia Naturae Curiosorum in Madrid in 1657, the Royal Society in London in 1660 and the Académie des Sciences in Paris in 1666. During the second half of the century

the foundations were laid for a number of important science museums in Germany; Buffon assembled at the Jardin du Roi in Paris collections in every department of natural history; and the collections made in America and Algiers by the Tradescants, gardeners of King Charles I of England, passed through the hands of Elias Ashmole into the possession of Oxford University to become in 1683 the Ashmolean Museum.

In the eighteenth century museums began to be definitely recognized as of public significance as well as a means of gratification to the aristocracy of rank or scholarship. Between 1740 and 1750 the first Christian museum was established at the Vatican by Pope Benedict XIV. In 1753 the collections of Sir Hans Sloane were accepted by act of Parliament for the establishment of the British Museum. The first American museum was organized in 1773 at Charleston, South Carolina. At Madrid the Museo Nacional de Ciencias Naturales, established by royal decree in 1771, was opened to the public in 1776. In 1793 the Muséum de la République (now Musée Nationale du Louvre) was constituted at the Louvre and the next year the Jardin du Roi became the Muséum National d'Histoire Naturelle. The Conservatoire des Arts et Métiers, the oldest industrial museum, was opened at Paris in 1799. By the close of the century museums were firmly established as public institutions, although their potentialities for usefulness had only begun to be appreciated.

In the nineteenth century the museum emerged from its formative stages—the palace collection, the cabinet of the prince or scholar and the public depository of materials from palace or cabinet—into the modern museum, a laboratory of research and an educational center. The development of the museum as a laboratory was influenced by the spread of archaeological research and the publication of Darwin's *Origin of Species*. Biology turned from classification and recording to the investigation of relationships, and archaeology became a science rather than an outlet for curiosity. About 1870 educational exhibits, as distinguished from exhibits which were only collections, were first installed in museums. The earliest science museum group in the United States was shown in New York about 1869, this type of exhibit having had its origin in England a few years earlier. Mammal and bird groups were developed in American museums in the 1880's. At about the same time lectures and active educational use of exhibits began in science museums, the lead being taken

by the museums at Buffalo, New York, and Davenport, Iowa. In the art museum field the Musée de Cluny¹ was opened to the public in 1844, with its collections, including craft work of the Middle Ages, arranged by period, in contrast to the galleries of the palace museums filled exclusively with paintings or with sculpture. In 1851 the Great Exhibition at the Crystal Palace in London focused attention on the generally inartistic nature of articles for everyday use produced at that time by machine manufacture. This demonstration of the machine threat to the handicrafts, following upon the custom engendered by the romantic movement of assembling collections of old furniture, fabrics, utensils and other objects, led to the establishment of the craft museum with collections arranged by material in departments of woodwork, metal, textiles, pottery, glass and so forth, and to the introduction of industrial arts into museums already established. The first museum of industrial art was established at South Kensington the year after the Crystal Palace exhibition. Museums became a source of design ideas first for handicrafts and later for machine manufactured articles. A further step in the arrangement of collections was taken in 1888, in which year the Nuremberg museum installed six original period rooms of the fifteenth to the seventeenth century with appropriate furnishings. At about the same time the British Museum (Natural History) was engaged in arranging its "introductory series" in the central hall of the new building at South Kensington. The general scheme for arranging the collections in this building included three series: introductory series, exhibited systematic series and reserve, or study, collections, this constituting a formal adoption of the idea of Louis Agassiz and J. E. Gray that there should be a sharp separation of the exhibited material and the study material.

An important influence on the establishment of museums during the nineteenth century was exerted by the international expositions, beginning with the Crystal Palace exhibition in London in 1851. These expositions, by directing attention to scientific, artistic and industrial developments, by demonstrating the effectiveness of visual education and by assembling material, aided largely in the growth of the museum movement. In many cases the exposition was seized upon as an opportunity for the erection of permanent exhibition buildings to be used later as museums. Notable examples are the Trocadéro at Paris (Exposition Universelle of

1878); Memorial Hall at Philadelphia, now one of the buildings of the Pennsylvania Museum of Art and the oldest existing public art building in the United States (exposition of 1876); the first building of the Field Museum of Natural History (World's Columbian Exposition of 1893); the building of the Museum of Science and Industry at Chicago opened in May, 1933 (also an outgrowth of the exposition of 1893); the City Art Museum at St. Louis (Louisiana Purchase Exposition of 1904); the San Diego Museum (Panama-California Exposition of 1915); and the building which was until recently the home of the San Diego Natural History Museum (exposition of 1915). The Centennial Exhibition at Philadelphia in 1876 led also to the establishment of the department of industrial arts in the United States National Museum at Washington and to the erection of a building for the department. Other museums trace their origin to exhibits at great expositions which were later used as nuclei for the museum collections.

After the opening to the public of the museums in London, Madrid and Paris in the eighteenth century museums began increasingly to acquire a democratic character. Reluctant at first to admit the ordinary citizen—as indicated by the early rules of the British Museum restricting admissions to thirty people in any one day and requiring even these to obtain permits in advance—museums have steadily modified their practise, first so as to bring more people into the building and then to extend the museum's influence beyond its walls. Originally it was customary to arrange the whole collection in one series: every object was for exhibit as well as for study. Rows of animals, birds or skeletons; cases crowded with minerals, shells and other specimens; and solid galleries of sculpture or of paintings, were the rule. Later, in order to relieve the dullness of repetition and to attract popular attendance, a selection was made for exhibit, the rest of the collection being arranged in systematic order for the use of the research specialist and housed in a separate part of the building. Some zoological exhibits came to be arranged against natural backgrounds painted on canvas; improvements were made in the art of taxidermy so as to produce more lifelike effects; and finally there was evolved the habitat group, showing animals and birds mounted in natural attitudes with surroundings as in nature. Early in the twentieth century miniature groups began to appear in museum exhibition halls. In the last five years these groups have become popular

and are in use not only for natural science but for anthropology, history and industry exhibits. In the art museum the more flexible methods of arrangement, the introduction of industrial and decorative arts, the installation of period rooms and the development of the temporary exhibition have all had the effect of drawing people into the museum. This democratizing of the museum itself has been accompanied by an increasing effort to extend the museum's influence outside its walls, first to the schools and then to the community as a whole in ways that will be indicated later.

Today there are more than 7000 museums in the world; Markham has estimated the number as 8000. Of these about 6500 are in continental Europe, the British Isles and the United States. Germany and the United States are far in the lead in numbers, with more than 1500 museums each. Next come France and Great Britain, with more than 1200 about equally divided between them. On the European continent museums vary somewhat according to racial or national differences. France has a large group of important national museums in and near the capital city of Paris and some 500 provincial museums which owe their existence for the most part to the revolution and which have derived their collections from property seized at that time and from material acquired by the nation through conquest, purchase and in other ways and distributed in accordance with government policy. Italy has more than 400 museums. In that country the outstanding characteristic of the older museums, which are in the majority, is that they reflect the ancient civilization existing in their separate regions and the taste and policy of princes, schools or prelates of the city-states. In France and Italy most of the museums deal with art and archaeology, notably the Louvre and Luxembourg in Paris and the national museums of Florence, Rome and Naples and the Vatican museums in Italy.

In Germany and the other Teutonic countries the people have developed a keener sense of the value of museums than is to be found elsewhere in Europe, and it has been estimated that in these countries there is a museum for every 40,000 inhabitants. Culture history museums are the most numerous, constituting nearly 50 percent of the total. Historical museums and natural history museums follow in order. Germany also has many fine museums of art and archaeology, in particular those at Berlin and Munich. The most famous of all industrial mu-

seums, the Deutsches Museum, is at Munich. In Germany the museums are for the most part provincial; but whereas in France such museums are bound closely to the national government, in Germany their relations are rather with the state governments within the Reich. They are more varied in subject matter, more a source of local pride, more generally used by the people.

Soviet Russia, which has about 200 museums, is using these as an effective tool of educational propaganda. In museums of science the emphasis is on evolution and on studies in applied science; in museums of art the emphasis is on the social significance of periods and kinds of art work. Special museums have been established to illustrate the revolution and the principles of communism. The management of all Soviet museums is directly in the hands of the central government.

In Great Britain museums have developed with less government supervision than on the continent. More of them are general museums; that is, museums which include art, science, history and industry. The British Museum, by its extraordinary size and scope and its long history, has to some degree overshadowed the others. In the Orient, Japan leads in museum development, with more than 160 institutions; China has about 100, and India 90. In Australia and New Zealand there are about 160 museums and in Africa 60. South America has 100 museums; 58 are national museums, of which 51 are located in the capital cities. Two thirds of the total are devoted to one subject; natural history leads, and history, art, anthropology and commerce or agriculture follow in order. There are 125 museums in Canada and about 75 in Mexico and the West Indies.

In the United States the educational activity of the museum has been given full scope. Children's museums and traiside museums were first established in America. Fully developed educational departments using school cooperation, guide service, publications, radio, loan exhibits, slides, films and all the other educational devices are to be found only in the United States. The typical plan of museum administration in the United States is that of control by independent boards of trustees, either self-perpetuating or elected by vote of members of the museum society. Of the 1500 museums nearly 800 are public; more than 400 of these are history museums, about 170 are art museums and 125 are science museums. There are 24 industrial museums and 50 general museums.

About 600 museums in the United States are owned by universities, colleges and schools. The investment in public museum buildings is more than \$100,000,000 and in college museum buildings \$10,000,000. Revenues of museums in the United States exceed \$16,000,000 yearly. Endowments, gifts and membership dues are the chief support of public museums; this is in marked contrast with museums abroad, which are supported and administered for the most part by government agencies. Some of the important public museums in the United States are the United States National Museum under the administration of the Smithsonian Institution at Washington, the Metropolitan Museum of Art and the American Museum of Natural History at New York, the Museum of Fine Arts at Boston, the Field Museum of Natural History at Chicago, the Art Institute of Chicago, the Pennsylvania Museum of Art at Philadelphia and the art museums at Detroit, Cleveland, Cincinnati, St. Louis, Toledo and Providence.

Museums comprise in their province almost every subject that is represented by objects. Most of them may be included, however, in five major divisions: art, science, history, industry and general. Science includes not only all museums dealing with geology, biology, palaeontology, ethnology, anthropology, medicine and so forth but also the planetariums, aquariums and botanical and zoological collections. Physical science has a place in most industrial museums. Many museums, for instance, agricultural museums, industrial arts museums, archaeological museums and folk museums, overlap at least two of these major divisions. Art museums often have sections for industrial art and archaeology, and they touch on the historical field with period room exhibits. Trailside museums are usually connected with natural history museums or with park educational development. Children's museums and school museums are invariably general museums. Scandinavian countries have led in the establishment of outdoor museums with houses assembled in one place. Similar museums are beginning to appear in the United States, where in addition a strong movement is under way for the preservation of historic houses and their interpretation to the automobile traveling public.

The chief function of modern museums is education, although the services of museums as laboratories of research and as guardians of the material evidences of the workings of nature in the past and of the accomplishments of civiliza-

tion and of the nation continue to be of great importance. Cooperation with the schools, which began in the United States in the 1880's, is now carried on by means of regular visits of school classes to the museum and by lectures and loans of objects, lantern slides, photographs and films. Museum visits and the use of museum material are regularly incorporated in the school program, and in many cities the board of education assigns special teachers to meet classes at the museum and to use museum material for instruction. In a few cities, notably St. Louis and Cleveland, museums have been established within the school systems for the sole purpose of providing material for the use of the schools. In others an endeavor is made to foster the establishment of museum branches in the schools themselves, the material in such museums being chosen for its suitability for classroom instruction. This is being done particularly in Pennsylvania through a cooperative plan of the Commercial Museum and the Museum of the University of Pennsylvania. In addition to work with the schools, museums provide for the instruction of children by means of story hours, museum games and other methods.

In the field of adult education the efforts of museums have developed steadily in magnitude and variety during the last twenty-five years. Lectures, conferences, study groups, clubs, courses of instruction and guide lecturing have emerged as the principal methods, supplemented by the lending of objects, photographs and paintings, slides, lanterns and motion picture films. Popular publications, newspaper publicity and radio broadcasts are used effectively to stimulate public interest. For the art museums the field of industrial art has offered an especially good opportunity for educational work because of the practical interest of designers, salespeople, buyers and others. Most art museums have amateur classes in drawing and other subjects as preparation for appreciation or knowledge of technique. The extramural work of science museums has recently taken a turn of special importance to adults. The purpose has been to find effective ways of using nature itself as museum material to be labeled and interpreted on the spot. This began with nature walks under museum guidance and since 1925 has brought forth park nature trails along which natural objects are tagged, and trailside museums devoted to study of the immediate locality.

Growth of educational museum work has

attended a progressive consolidation of the museum field, especially during the present century. One manifestation of this trend, in part its cause and in part its effect, has been the rise of the museums associations. The first, the Museums Association (British), was established in 1889. The American Association of Museums followed in 1906. These and other associations in Germany, Scandinavia and elsewhere paved the way for the most recent development during the past decade. This has been the consolidation of museum interests on an international scale, reflected by the establishment, through the International Institute of Intellectual Cooperation of the League of Nations, of the International Museums Office at Paris.

MUSIC AND MUSICOLOGY. *Music and Language.* To increase the understanding of the social function of music it is necessary first to examine the relation of music to language. Both music and language employ sound as their medium. Both communicate something from a sound maker to a sound hearer. This "something" is, in all the higher as well as in most so-called primitive cultures, an elaborately stylized selection of sound material which is assumed by both the makers and the hearers of the sound to have communicable content and social value. It is possible that there may be a field or content of music which may comprise something homologous to linguistic thought, logic or discourse. It is likely also that the musician communicates something homologous to an understanding of a social function through music. The essential problem is, however, how reliable language can be in presenting in words an understanding of the social function of music, when possibly every composer and performer of music is giving in his music something at least homologous to an account of his understanding of that function. Are the fields or contents of music and language identical or mutually exclusive? Or do they overlap—and to what extent?

It is difficult to say what is or might be the communicable field or content of music. Even the reports of the few men of recent times who have been blessed with unusual skill in both arts—such men as Wagner, Schumann and Berlioz—have not been of a positive sort. It is easier to say what music is not, than what it is. There are several opposing viewpoints upon the subject. The nature of the belief depends mostly upon the temperament. Believers in absolute music (music for its own sake) hold that music and language are incommensurable and had better be kept apart. Believers in the "marriage of the arts" hold that what can be communicated in language can be identical with what can be communicated in music and that opera is therefore an ideal and supreme social experience. Candid examination recommends a modification of both claims. Some persons may be able to effect a closer mystical rapprochement between music and language than others, but

little can be said at present about the logical correlation of the two. The logical use of language presumes the possibility of exact reference by its words and sentences to something other than the actual sound forms employed. Music, on the other hand, need not refer to anything outside of its sound forms. By common consent various affects, describable in language, can be attributed to musical stimuli, but there is no reason for supposing that because these affects or stimuli can be presented in language about music therefore they are necessarily presented as musical elements in music. Specific musical materials and processes can of course be associated with definite words and with the objects to which words refer, but this is not at all the same as communication through the medium of words. Meaning, especially precise or comprehensive meaning, as understood in language seems to be unnecessary in music. Definite meaning can be and often is attributed temporarily to particular musical processes, but there seems to be more left to music after such meaning has been abstracted than there is to language after its meaning has been abstracted. The communicable content of music is predominantly the sound itself—the forms of the tonal and rhythmic manipulation. The vague and shifting associations and suggestions of language meaning that music may produce are not to be confused with the definite precision and comprehensiveness of language meaning itself. By translation the content of a body of sound material of one language can be communicated with very little loss, if any, by an utterly different body of sound material of another language. But translation from one music to another music is not practicable. Briefly, if the sound of language is changed the sense may be preserved, but if the sound of music is changed its sense is changed. There is no other reason for this than habit. A social order in which the functions now exercised by language could be performed by musical tones and rhythms is not inconceivable. Indeed it is possible that something remotely approaching this was done in ancient China when, it is reported, prime ministers were selected according to their skill in music and affairs of state were conducted in terms of the

functions of the twelve *lü*, or basic tones. The chief difficulty in correlating music and language and our linguistically conditioned social fabric seems to lie in the fact that in music there is no contradiction. Opposites do exist in music, but they are not contradictory as they may be in language.

Musicology. Musicology, or the methodical treatment of music by language, is an ancient study dating back to Pythagoras in Greece (sixth century B.C.), to mythical periods in China, Japan and India and to the eighth century A.D. in Arabia. In the nineteenth century in western Europe, at the time when most subjects of learning were undergoing a reconstitution, musicology too took on a new lease of life. The bibliographical work of Forkel, Gerbert and others, shortly before and after 1800, laid the foundation for a study of the history of European music, which until that time had been woefully neglected. By 1850 modern scientific methods had completely revolutionized the subject. The publication of most of the important treatises on music remaining from Greek, Greco-Roman and mediæval periods and the publication and deciphering of music—notational monuments—occupied the attention of many capable scholars. The complete works of the great European composers began to be collected in monumental editions financed by world wide subscription lists. The upshot was the fixing of the new found powers of musicology in a historical, backward looking attitude, unavoidable perhaps in view of the enormous tasks at hand, but regrettable because it produced a wide gap between musicology and music.

Into the study of historical musicology were drawn in turn the sciences of archaeology, palaeography and iconography. The subject matter became interesting in itself and the question of its use to music was temporarily shelved. The work of Helmholtz in acoustics fixed the study of physics in the position of a permanent adjunct of musicological studies. Psychology and physiology, obviously interrelated in the undertaking, were brought in; and it is not unfair to say that a very large part of the musicological work of the nineteenth century which is not biographical or textual has been done in the laboratories of these sciences. Philosophy, in more ancient days the mainstay of musicological systematization, has lagged; but its subsidiary interest, aesthetics, has produced a small host of treatises upon music, especially in Germany. Toward the end of the nineteenth century the

various strands of these interests began to be drawn together by Hugo Riemann, Guido Adler and others, whose indefatigable labors have resulted in the creation in Germany of chairs of musicology in most of the important universities. The work of Ellis and Stumpf in the 1880's laid the basis for the later destruction of Europe's solipsistic concern with its own music alone. The extra-European musics, theretofore subject to a merely casual dilettantism, began to take the places in European musicological calculations that long before the languages of the world had taken in philology. Serious students no longer considered they had done their duty by oriental music with little more than a collection of curiosities and a couple of transcriptions for piano in four-part diatonic harmony, badly written "by ear." Phonographic recording was begun by Fewkes in America as early as 1890. Phonogrammic archives began to be established shortly afterward both in the United States and in Europe. Musicological work is now a recognized part of anthropological and ethnological undertakings. But buried, as most of these contributions are, in the journals of learned societies and in volumes which are for the most part incomprehensible to musicians, musicology has here a special task of sifting, correlating and interpreting.

The difference in viewpoint of the musician and the non-musical scientist appears often at first irreconcilable. What is essential truth for one may be irrelevant if not positively misleading to the other. A case in point is the 2500-year old dispute about tuning. Elementary physics has shown that there are certain types of pitch differences that can be described accurately by simple numbers. Thus in the occidental system of music the octave can be expressed as the ratio 1 : 2, the perfect fifth as 2 : 3, the perfect twelfth as 1 : 3 and so on. By comparing the intervals expressible by the simplest numerical ratios with the actual intervals used in occidental music, one cannot help being struck by what seems either an extraordinary coincidence or a revelation of the oneness of fundamental law in the universe. For these musical intervals have been chosen from the myriad possibilities of nature by the musical ear without knowledge of the physics of the situation. The disturbing element is the fact that if, for example, a physically "pure" tuning were given to all the notes in a sonata by Beethoven, from fifty to a hundred keys might be needed for each octave of the pianoforte. Since this is impracticable twelve

tones have been selected, spaced equally distant from each other and these twelve are accepted in place of the fifty or hundred. They are "out of tune," but the ear "corrects" this. What happens, however, when a violinist plays the sonata with the pianist? He can stop the strings with his finger at any of the fifty or one hundred intervals of the physically pure scale. But in many cases he does not; indeed, on the contrary, he often plays the intervals in a manner more out of tune with the pure tuning than the piano does. And this is approved as the best practise by the best musical judges. Dozens of other instances can be cited to show that the measurements of the non-musical scientist, indeed his very categories, are, although true for him, fallacious for the musician. Art appears to be concerned not so much with what is as with what seems. Standards of this "seeming" change, however, with amazing quickness; so that non-musical science, far from being rejected by the musician, should be continually referred to. But it cannot govern—it can only correspond. Music, for instance, cannot be conceded by any serious musician to be based upon physics or psychology or upon any linguistic technique. But since music exists for the present in a predominantly linguistic society, in which most people (even some musicians) are linguistically literate but musically illiterate, it will be necessary for a long time to come to bring in all the help science can give. But before this help can be utilized for the benefit of music, much of it will have to be translated from the non-musical to the musical point of view. It is still too early to attempt evaluation of the contributions from these sciences. Physics alone in its applied aspect has nearly revolutionized the profession of the musician. It began with the perfection of various instruments, especially the pianoforte and organ and the wood and brass wind instruments of the orchestra, then with the improvement of the acoustical properties of auditoriums and opera houses. The phonograph, the player piano roll, the recording piano and above all the radio loom upon the musical horizon as forces whose effect it is impossible to gauge. A veritable musical invasion of the rest of the world is being conducted from the factories, offices and broadcasting stations of Europe and the United States. The question is already being asked how many of the non-European musics can survive the onslaught even long enough for adequate recordings of their idioms to be made. Already French, German, English and American brass

bands are standard in oriental armics and navies, and native music is being adapted to western instruments.

The present state of affairs exhibits highly organized scientific activity, linked with vague, mystical and chaotic critical determinations. Musicology has these two main branches, science and criticism—probably equally important from an academic viewpoint—of which the critical, or evaluating, attitude predominated in the earlier stages of its development in Europe. Music, morals, statecraft, philosophy and the actual living of life are closely integrated in much of the primitive life that can be observed at the present time, and some of the earliest existing books report that the same was true of ancient China, India and Greece. There, the integration was formal—that is, certain values were attached almost legally to certain technical processes, as, for instance, in Greece certain modes were proper, others improper for the education of young men; in India even today certain music is appropriate to certain times of day; in old Hawaii singing with some qualities of voice brought the death penalty. Undoubtedly the musical laws were often broken, often changed. But the fact remains that there was far reaching and thorough effort to bring about a correspondence between the best thought and the general practise.

Criticism and Music. The formal study of musical value has two aspects: the intrinsic value of music and the value of music to society. Very little has been written in modern times upon the former, and practically nothing upon the latter. Although scientific method has been polished with infinite care, the method of criticism is still riding in a chaise. The result is a tendency to absolutism in values on the part of individuals but disregard of values in collective undertakings—for a sane musicology, two equally undesirable extremes. Musical value does not depend upon any one set of criteria, but various criteria arise from several diverse and equally important sources: the almost instantaneous taste reaction of the individual; various musical group tastes, into one of which the individual taste reaction tends very soon to merge and to several of which he is likely to defer either consciously or unconsciously; the mandates of musical history, those determinations of value that are presented in the myriad ways a complex history can record them; the current musical idiom of any place or time, a body of theory and practise which not only represents achieved

values but which continually destroys old and creates new ones; the group tastes of musically untrained people, especially of those in control of powerful institutions, e.g. political, religious, economic; the determinations of value of an extramusical sort that come down in an almost chaotic confusion from ancient times; the contributions of contemporary non-musical sciences. In no one source are the criteria without serious conflict; from no two sources are the criteria extractable by the same methods or with equal ease, nor are they easy to make commensurable with one another. At present, with romantic individualism at the basis of European and American musical thought, two of these sources of criteria—the present musical idiom (musical science) on the one hand and the present non-musical sciences on the other—are irreconcilably opposed to each other. In a predominantly authoritarian state, such as existed in the past of some oriental cultures, there might be no conflict between the musical and non-musical sciences—they would be merged by decree, if necessary—but there would undoubtedly be a greater conflict within the individual between his personal predilections and his duty to the state. Any final judgment of musical value, then, must wait for a utopia wherein the extrinsic and intrinsic criteria are permanently adjusted.

All musicians exercise critical functions; they take hold of the inherited stream of musical development at the point where they reach it and express, by the kind of music they compose, perform and listen to, the value judgments they wish to or must proclaim. The distinguishing of the critical element in their work depends, however, in part upon their adjustment of it to their skill in technique. The great composers, for instance, are not necessarily the great critics. Sometimes their greatness depends more upon their skill, sometimes more upon their taste. Thus in European music one of the men whose critical accomplishments are most notable, Monteverdi, is not regarded—and rightly—as one of the greatest composers on account of a frailty in technique due to the fact, perhaps, that his critical acumen led him to see so far ahead that he experimented with processes that were not perfected until centuries after his death. On the other hand, Saint-Saëns had a brilliant technique but showed no particular critical taste. The greatest composers, however, show an approximate balance between the two capacities. This necessary union of technical and critical

ability is one of the things that make the literary criticism of music so difficult. The musician presents the facts and the values of his music inextricably interwoven. The literary critic has to deal separately with facts and values. This has led to the cultivation of two distinct types of literary criticism of music: the impressionistic and the scientific. When the extrinsic judgment of music is expressed in the impressionist vein the musician must sit and listen or reply in the same terms—non-musical terms. But when the literary critic of music attempts scientific criticism he is invading the musician's stronghold, and if he is to maintain himself there he must be thoroughly acquainted with the technique of music. As long as his judgments are in agreement with everyone he has no trouble, but as soon as he disagrees with the musician he is asking his readers too much, unless he can (or persuades them that he can) write the music better himself.

Musical Science. The technique of music has been regarded as something of an esoteric secret by the professional musician, especially in the higher cultures of Europe and America. The setting apart of any group of people as music makers is a comparatively late social development and, from a musical viewpoint, not an entirely fortunate one. Musicians have never been particularly satisfied with the linguistic formulations of their skill as "technique." Most of these have been made for such special cases that their general use is precluded. The first requirement of a formulation of musical technique is a basic plan that can fit the music of any time and place; the second, a standard of measurement that will not only be musically intelligible but will be uniform for the whole field now known and likely for some time to become known. The most serious lack in most of the older musical theory was that it regarded musical processes as fixed standards rather than as the continually changing things they are. Even in ancient China and Japan, where tradition in music was regulated by royal or religious law, music changed its aspect continually. Indeed sometimes change was legislated into it, as, for instance, in China during the period when each incoming dynasty or emperor commanded the basic normal pitch of the musical art to be changed. A third requirement of any modern formulation of musical technique must be a clear differentiation of the domains of musical and non-musical considerations.

The definition of the technique of music

which would probably meet with least opposition is that of "the forming of music out of tone and rhythm." Tone and rhythm are data of the science of physics and can be combined in other ways than the musical way. Not all the tonal and rhythmic data of physics are available for musical form. Those which are may be called the physical, or raw, materials of music. These materials have each three characteristics whose variability is of importance in music. Tone has pitch, intensity and timbre (or quality); rhythm has speed, accent and proportion (or relative length of beat). As a matter of physical fact these two raw materials of music are two only to the musical ear. Together they can be represented upon one scale as simple frequency or mere occurrence in time-space, with rhythm occupying one part and tone an adjacent part, separated by only a small interval. The slowest perceptible rhythmic occurrence, or pulsation, has not yet been defined. It may span an interval of many minutes. The slowest simple (undivided) beat seems to occidental ears to be a speed of about 30 occurrences per minute: the fastest simple beat may be about 300 per minute, while the fastest rhythmic pulsation may be fixed at about 16 per second, when the separate sounding of the beats ceases, at least for the occidental tempo sense. This may be put down tentatively as the tempo or speed gamut. Increasing the speed of similar simple occurrences, the beats become a kind of flicker, or rapid tattoo, until by the time they reach the speed of about 32 per second they are heard as a low tone. The cycles, or rate of vibration, of the accepted as musical tone extend from approximately this point to a little over 4000 per second. This is the pitch gamut. Fine musical ears can distinguish separate pitches up to 30,000 per second or more. It is also possible to hear tones lower than 32 cycles under certain circumstances. Thus the single variable of physical frequency becomes for music two variables: speed of rhythm and pitch of tone, each of which has its low, medium and high and whose serial sequence may be observed as increase, constancy and decrease in frequency.

It is possible both in pitch and in tempo to slide or to jump from one frequency to another. The former produces an unarticulated, the latter an articulated variation. The occidental art uses both of these, but the articulated is the basis upon which such sliding as is done is thought out, written and performed, and it may thus be spoken of as an articulated music, as far as pitch is concerned. Some musics slide in such man-

ners as to make it extremely improbable that fixed pitch psychology can be assigned to them. On the whole it appears that the pitch variable is generally more elaborately articulated than the tempo variable, some instruments, such as the pianoforte, organ, harp, xylophone and metallophone, being unable to slide. How much more sliding there is in occidental music and how much more important it is in music generally is only now being recognized. It is this point that invalidates the claim to scientific accuracy in the transcription to European notation of non-European musics, a procedure still too much relied upon by comparative musicology.

While occidental music treats the frequency variables as the most important or fundamental ones, it is not proper to grant them this priority in any broad study of music. For they never occur in music except in conjunction with the other four characteristics, i.e. pitch never occurs without loudness and timbre, and tempo never without accent and proportion. Nor do these two sets ever appear in music apart from each other. There is no doubt that tempo and pitch are the easiest to talk about and to measure. It may be for this reason, and not because they are more important musically, that the theory of music has spent so much time in organizing them, while those that are hard to talk about have come to be regarded as secondary. The variation in amplitude of vibration which causes the sensation of loudness and softness in sound varies between a soft tone on a violin and the fortissimo of the concert orchestra approximately as 1 to 20,000,000. The timbre, or quality, of a tone, which is the result of the interplay of frequency and intensity of a predominant tone and its concomitant accompanying tones, is so complex that no one scale has ever been devised upon which its variation can be plotted. The same sort of thing can be said of the other variables of rhythm—accent and proportion. All six of these fundamental aspects of the raw materials of music must be regarded, at least in theory, as being equally important, although the various musics of the world never make use of them all in the same way.

The raw materials of music through their six variables have certain inherent forms in which they combine among themselves, entirely apart from any connection with music. These may be called the physical forms of the materials. The wind blows in the trees, the horse's hoofs sound on the ground and the subway train makes its

run with squeaks and rumbles, now soft now loud, in varying tempos and accents according to the construction of rails, wheels, trucks, couplers, the demands of crowds and traffic regulations. These may be accepted as compositions in terrestrial mechanics, natural history or engineering but not in music.

Music is a phenomenon of prolonged social growth—a culture. It is not only a product of a culture but one of the means by which the culture has come to be what it is and continues. For a longer period than there is any record of, men have manipulated the raw materials of music in a manner deemed by them (or taken for granted) to be socially useful and valuable, but with a result entirely different from the sound-rhythm sequences mentioned above. Each great culture has become habituated to a particular kind of manipulation of the material, so that their musics are quite as distinctive as their languages. This results in a profound modification of the attitude toward the raw materials and of the forms inherent in them and imposes upon them a new class of forms, which may be called the forms of the manipulated materials, or the musical forms. These resemble the physical forms about as much as the forms of baskets and vases resemble the forms of willow trees and clay in pits.

The simplest musical form is the single, unaccompanied melody or melodic line. It consists in the simultaneous continuity of all six variables mentioned above. This definition must be understood to signify explicitly that a melody is not merely a sequence of pitches. It is equally a tonal and a rhythmic form and can no more exist without the one (and all its three variables) than it can without the other (and all of its three). Musically, then, these variables are known only in conjunction. Abstracted from a musical context they are no longer of use to the musician, although they may be to the physicist or psychologist. The manipulated form gives them characteristics that the physicist cannot grasp with his tools and concepts. Their musical character bears a relation to their physical character similar to the relation borne by the musical form (melody) to the physical forms. The musical character of these variables may be called function or resource, according to whether we are speaking scientifically of an objective process or speaking critically of the composer's subjective act of willing to do such and such. The musical variation of the functions may be called inflection. Thus when the pitch frequencies of

a melody increase, the pitch function exhibits tension; when they remain constant, poise; when they decrease, relaxation. Similarly with the other five: tension results from louder sound, stronger partial tones, faster beat, stronger accent and divided beat; relaxation results from softer sound, weaker partial tones, slower beat, weaker accent and prolonged beats. A certain definite effect of a peculiarly musical sort is gained when tension, relaxation and poise occur simultaneously in all functions of a melody. There is a "together-soundingness" that has an important significance in the higher elaboration of musical technique. When tension occurs in some and relaxation in others an "apart-soundingness" can be noticed, which is of equal importance.

Continued habitual manipulation of the musical materials in melody has led to the conception of higher forms, or branches of technique, through the combination of melodies: (1) simultaneously two or more single melodies sounded at once according to more or less accepted conventions of harmony and counterpoint; (2) sequentially, two or more single melodies sounded one after the other according to more or less accepted conventions of musical structure; and (3) melodies sounded both simultaneously and sequentially. To this last and most complex type belong most of the works that have made the European art of music for the last thousand years. As a result of generation after generation of practise in these higher forms, the inflection of the original six functions of the single melody have received in turn more complex character. The three higher branches of technique may be referred to as the chordal, gross-formal and architectonic functions. For instance, the pitch function in melody results in what is known as mode. In the higher chordal form it develops what is known as key. In the gross-formal it builds in addition tonality in the broader sense, where extensive changing of key and mode occur. In the architectonic, where large blocks of modes, keys and tonalities are massed, as in the symphonies of Beethoven and Brahms or the music dramas of Wagner, the processes are recognized but are not named. The remaining functions receive similar although less consciously organized elaboration, until the complexity of the analysis is beyond practical handling. Even in two-part counterpoint, such as results from two solo voices singing a duet unaccompanied, each melody besides showing a different inflection of the six melodic functions,

twelve in all, shows relations, varying in importance, between each of the twelve with the remaining eleven. No one likes to think of counting them. The true musician, however, keeps his eye and ear upon them all and calculates nicely the effect of all the important ones. In respect to the equal development of all the basic functions none of the great musics of the world presents a balanced art. This may or may not be the characteristic of the international art of music that appears to be now in the process of forming.

Occidental music is to be distinguished for the simultaneous sounding of diverse material; the development from this practise of a so-called system of harmony, that is to say the viewing of the simultaneous combinations of tones as units or chords, among which elaborate functions have been cultivated; the development of a system of notation for music; the principle of consonance and dissonance; the mechanization of performance, by which large aggregations of performers follow very minute written directions with great precision; and technological development of instruments, their mass production and economic exploitation through engineering based upon the results of physical research.

The simultaneous sounding of diverse melodies, or polyphony, is to be distinguished from the simultaneous multiple sounding (with only approximate likeness) of one and the same melody, which is a favorite device of many oriental musics. Polyphony is not rare in other musics; indeed it is highly cultivated in east India, Indo-China and Indonesia. Outstanding in European polyphony is the practise of canon, i.e. the singing or playing of one and the same melody by two or more performers, beginning at slightly different but carefully calculated moments. The effect is of one voice chasing the other. As an art form in the fugue this represents one of the most complex and curious of musical practises. There are many places where the exact opposite is cultivated, as, for instance, in the art music of the Javanese *gamelan*, in which it is considered poor skill to play what the other musician is playing.

The harmonic or chord system of occidental music is a spectacular development which is not known to have prevailed elsewhere. It has called forth more fanciful artifice in the way of linguistic theory than all the other phases of musical technique put together. Theorists have never agreed about many essential and fundamental

points; but the composers, especially from 1700 to 1900, have displayed the most remarkable agreement in the actual use and development of the system. The basic type of the chord was the triad and was composed of three tones, of which there were two main varieties: a major, conforming to the tones of the first six partials of a harmonic series in superior resonance (the tones obtained by the division of a sounding string into aliquot parts in the order 1, $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, $\frac{1}{5}$, $\frac{1}{6}$); and a minor, conforming to the tones of the first six partials of a harmonic series in inferior resonance (the tones obtained by the multiplication of a sounding string by 1, 2, 3, 4, 5, 6, in turn). The attention given to this device by composers has resulted in the increase of the number of chords to such an extent that composition by chordal construction shows signs of a decline. Originally three of these triads, at a relationship of 2 : 3 to each other, defined a key. By a process of key changing, incorrectly termed modulation, successive groupings of these trinities of triads defined tonality, a conception real enough in music but very elusive of definition.

Occidental notation, although a most useful tool, is still inadequate for the notation of other than occidental music and not any too good for that. Present day researches are evolving it into a graph notation which can record or prescribe, to any desired degree of accuracy, any conceivable music using clearly defined pitches and any kind of rhythm. When this graph notation is released for practical musical work, the study of comparative musicology will be put securely upon its feet. This does not mean that the letter, symbol and stenographic notations of the Orient are to be discarded. On the contrary, a graph notation would help in understanding them and in preserving that understanding.

The principle of consonance and dissonance appears at present to be a unique achievement of occidental music. At least the non-western parallels of it have not been distinguished. The concept seems to be an extension to a higher form of the basic "together and apart-soundingness" referred to above in connection with the basic technical functions. When the principle of inflection was extended to the chordal branch of composition, poise and relaxation, as the result of a custom whose origin is unknown, were associated with the consonant intervals, and tension with the dissonant. These concepts were gathered together in a device known as (consonant) preparation and (consonant) resolution of dissonance, which imparted to the fabric of

composition a poignant and pulsing character that became so much prized that composers' interest became centered in dissonance. The continual search for more tension (and hence more dissonance) resulted soon after 1900 in the making of dissonance and tension the rule rather than the exception. Some modern theorists claim that the distinction between consonance and dissonance no longer holds. It is an intricate historical problem and will be dealt with more at length below, along with the two remaining distinctions of occidental music.

There are two respects at least in which occidental music is behind some of the other musics of the world in technical development. In the first place, the tendency to mass production and mechanization has done away with many of the more subtle possibilities that still survive in the more intimate arts of the Orient. The tendency to pursue tension as over against poise and relaxation, predilection for the showy and the theatrical, the acrobatics of too highly trained specialists, all lead in the same direction. In the second place, the development of rhythm is in occidental music in many respects far behind the development in some other musics, notably that of India. The African signal drumming too is utterly beyond western capacity, a surprising situation in view of the polish given to the pitch function. Why western music has not explored the rhythmic intervals and chords when it has before it all the time the pattern of the tonal parallels is hard to explain.

Those who have their eye toward the advancing study of comparative musicology are already speculating upon what the Orient and the Occident are going to learn from one another. That the musical rapprochement may be more rapid than that of any other art might be expected, since western music is already, without any knowledge of such a course, advancing toward experiment in possibilities of music that have long been staple practises in other musics. Not the least interesting to the West are the primitive musics, most of them highly complex and making use of vocal and instrumental capacities both new and fascinating.

CHARLES SEEGER

PRIMITIVE. The term primitive is used to describe those musics which have no formally or deliberately established scales, norms or theory, and whose instruments are comparatively crude. Many peoples practice such music, which is still little known. The music of the

peoples of certain parts of Asia, Africa, the South Seas, most of the uncivilized regions of Australia and South America, some parts of Canada, and of the Indians in the United States and Mexico is as yet unsurveyed in this respect. Investigators have paid more attention to primitive vocal music than to primitive instrumental music, particularly since the latter is infrequently cultivated apart from its service as an accompaniment to song and dance. In all primitive society vocal music is prominent in ceremonial procedure. Ritual songs are frequently overemphasized at the expense of secular music by students and collectors interested in the ceremonies for other than musical reasons, although both usually occur in varying proportions and categories. Much ceremonial music reveals a pattern tendency, songs for a given ceremony often being structurally similar and limited in concept by adherence to a formalized style. Secular music is likely to be more varied and colorful. Hence collections based only on ceremonial music are not satisfactory representations of the musical achievements of a people.

The concept of the musician, as a socially distinct individual, hardly exists in most primitive societies, for music making and song composing are indulged in by any who have the desire and ability. Some, however, are recognized as more able than others and are accepted as leaders. In many social groups songs are regarded as magically endowed, valuable for propitiating deities, curing the sick and vanquishing enemies, and may be personally owned. They may not be used by others than the owner unless he sells them for a good price, gives them away or bequeaths them at death.

Vocal music tends toward greater metric regularity if associated with some form of bodily movement and lapses into irregularity without it, when merely accompanying language. With its irregular flows of meter and rhythm language tends to shape the more or less spontaneous melodic intonations not only in movement but in rise and fall of tone. Little research has been done in this field. Evidently melody for its own sake is a comparatively late phenomenon, often associated with a high development of tonally rich musical instruments. It has not yet been reached by certain peoples, whose music now and then affords interesting examples of the struggle for supremacy between music and language.

North and South American native vocal

music is monophonic or at best polyphonic only in the difference in range of men's and women's voices and in inadvertent sporadic harmonies. Much American Indian singing seems unique in its peculiar voice production—a pulsating tone. Navaho differs from most of the rest in its extravagant employment of very high tones and falsetto. The women of many Indian tribes use a squeezed, high tone, not unlike that cultivated by the Japanese. Hawaiians consciously develop tremendous lung capacity so as to be able to produce light, floating tones for a long time without breathing and delight in a rather pronounced vibrato, while an odd break occurs in the shifting of registers, which amounts to a style. Some tonal and considerable rhythmic harmony is found in the South Seas and in Africa. These harmonies are produced by combinations of instruments as well as in vocal music. Part singing was reported by early explorers to the South Seas; and particularly in Tahiti great choral ensembles appear to have been inspired by native suggestion without influence from the European world. In Africa antiphonal singing is a very old practise and many Africans seem to take naturally to tonal and rhythmic harmonies.

Few really primitive instruments except musical bows, flutes and the African marimba and mbila offer much tonal variety, while the rhythmic possibilities of many of the others are great. Where instruments are largely of the rhythm making sort, extraordinary rhythmic developments may occur, as in Africa. On the other hand, the old native Hawaiian music was not only tonally very limited, but rhythmically simple. The multitude of stringed instruments with great tonal possibilities in southeast Asia seems to contribute conspicuously to the unusually elaborate development of melody among some of its peoples. Most primitive music lies between these extremes, and generally neither melody nor rhythm appears to be experimented with independently to any great extent and solely for its own appeal. Instrumental music in many lands has been used for communication. In the South Seas, parts of western North America and in certain regions of Africa flutes and musical bows are used to convey messages between lovers. In Melanesia, Africa, the West Indies and Aztec Mexico drums have been particularly useful in tribal communication over long distances and in war.

The sudden contact of Europeans with the "savages" of America after trade relations were

established led to the first serious investigations of a linguistic and ethnological character all over the world. The songs of Indians were early matters of comment. But the science of comparative musicology has had a tardy commencement. In the last fifty years several students have devoted considerable time to the study of primitive music and each has stressed a more or less different aspect of the problem. Earlier scholars naturally were engrossed in the ethnological setting of the songs, but also attempted to find in them evidence for a submerged harmonic system similar to that developed in Europe since 1700. Scales next became the principal interest and great importance was attached to the tonal content of songs and to minute tone differences. At a somewhat later date rhythms were the main theme, together with types of intervals sung. All these phases still receive considerable attention, but certain contemporary investigators feel that form and design in composition, varieties of melodic curves, styles of singing and voice production, are yielding data more significant for the study of primitive music than specific scales and intervals.

Even music generally considered primitive is complex, with almost unlimited possibilities in the stylistic combinations of its various constituent elements. Hence it offers exceptionally good material for comparative studies which aim to discover what traits may be common to various musics, what is the nature of the differentiating characters and which ones reveal a possible common heritage of style. The last affords interesting and valuable evidence in the problems relating to movements and relationships of peoples having no written or reliable history, since there are almost no chances of accidental similarity in such complex art. In this connection musical instruments also have their role. Considerable attention has been paid to them as such and fine collections exist in most ethnographical museums and have been listed in voluminous works. Formerly they were interesting merely as curiosities but more recently they have had their share in furnishing evidence of cultural diffusion through studies of their geographical distribution.

Even rather simple instruments may contain enough complexities to make it appear unlikely that they have arisen independently in various cultures as original inventions. Thus E. M. von Hornbostel in a study of pan pipes and their distribution has concluded that the re-

markable similarity between Javanese and certain Pacific Ocean pan pipes and South American forms is hardly the result of mere accident. H. H. Roberts has suggested that the distribution of two types of conch shell trumpet (lateral and apical), considered together with the life zone of the shells suitable for such trumpets, indicates wide dispersion by human agency from Asia across the Pacific to the Americas in pre-Columbian times and from India west through southern Europe to the British Isles and the coasts of the North Sea; while the fact that Africa in general, including Egypt, lacks them indicates that the dispersal was not due to peoples inhabiting that continent. Exercising due caution and pursuing correct methods of analysis, students may expect from comparative studies of this sort valuable aid in solving these problems.

In primitive music are found, now here, now there, the rudiments of most of the stylistic and elaborative devices employed in modern European highly developed music, and some that it has as yet almost ignored as possibilities. There are traces of such features as distinguish developed music of other regions, like that of India, which has used certain devices almost to the exclusion of others. The actual presence or absence of traits like modulation and ways of achieving it, linked melodic assonance, various types of melodic rhyming, paired reverse melodic curves, types of design building by means of initial, internal or terminal incrementation or telescoping, is not so important in determining or characterizing styles or recognizing relationships or utter incompatibility, as combinations or relative prominence of such traits. Primitive music is thus not only a fascinating study in itself but offers suggestive material for new lines of development of musical art and affords valuable data in the field of ethnology.

HELEN H. ROBERTS

ORIENTAL. Music to oriental peoples is a definite expression of philosophic and religious ideas and principles and its function is to induce an emotional understanding of these principles. Thus certain definite musical materials are associated with particular religious and moral practices. The musical means for the realization of this function vary in the different parts of the Orient but the general purpose is everywhere the same. The oldest cultivated music systems are those of India and China. Indian music spread

through Persia and Arabia and also influenced the music of Java. Chinese musical theory and practise are at the basis of Japanese music and have also influenced the music of Siam and of the Malay Peninsula.

Indian music is assumed by legend to have been originated by the gods. The gods gave forth the seven principal *ragas* together with the seven different philosophical categories which they represent. All Indian art music since has been created through an elaboration of each of these *ragas* into families of related *ragas* and *raginis*. A *raga* is, like a scale, a pathway through pitch. Unlike a scale, however, a *raga* is also a mood and the name of the *raga* covers the philosophical mood as well as the physical pitch. Furthermore the basic unit of a *raga* is not always a single continued pitch, as with a scale, but is often a sound containing a conventionalized curve; and the types of curve used as units vary with different *ragas*. Although authorities vary greatly as to exact numbers, it can be said that there are at least 49 different *ragas* in constant use in Indian music, at least 500 other *ragas* which are occasionally employed, and at least 31,000 others which exist theoretically, but of which some only are sporadically used by Indian musicians. The study of rhythm has also been greatly elaborated in Indian music and includes both a development of irregular meters such as five, seven, nine and eleven (in which two or more accented beats often follow in succession) and a studied concept of the rhythm of a whole composition. Certain rhythmic forms of composition have a certain specified number of beats and metrical units, and the performer must always be aware of which beat he is playing in reference to the work as a whole as well as to each particular measure. Definitely unmetrical forms also exist, often in introduction to metrical forms, in which the players improvise in accordance with certain established laws.

Many of the *ragas* have a specific meaning and use. There are special *ragas* for the morning, afternoon and evening which must be played at exactly the right time. There are *ragas* appropriate for certain seasons, and *ragas* for only a certain day of the year. There are also certain *ragas* for each major emotion such as love, hate and religious ecstasy, for inducing rain, for casting a spell and for every shade of philosophical meaning. The emphasis on *raga* differentiation has resulted in Indian music being probably the most varied melodically of any known music. The rhythm is also very subtly varied in drum

playing. Classical knowledge lies in the hands of master musicians only and a prospective pupil must be very talented and very serious before he is accepted by the master. If accepted, he must study in constant association with the master for many years before he is considered an independent musician. And no music of a high nature may be played for an outsider. One must prove one's earnestness before being permitted to hear a note of it, much less to learn it. There are ancient Sanskrit methods of writing music, but it is assumed that one knows the *ragas* before reading. The notation, therefore, is of value only to the musician who has already studied the *ragas*.

Chinese music, like Indian, is of great antiquity. It is known to have flourished as a highly cultivated art during the whole of the Chou dynasty (1122-255 B.C.). According to the tradition of that time, Huang Ti, who lived about 2600 B.C., invented the most ancient cultivated scale, which was played on the *sêh*, a zitherlike instrument originally with 50 or 52 strings but later reduced to 25. While the exact tuning of this scale cannot be ascertained, it is so notated that it is certain that there were no less than 24 different tones in it, and it is more probable that all 52 tones were different. In the Chou dynasty the *yü* was also a favorite instrument. It was the oldest form of the more modern *shêng* and consisted of a fixed air chamber into which 47 smallish pipes were set. Two sets of the pipes were alike, with one over. This gave a scale of 24 different tones, or "quarter tones." Since it was technically impossible for the *yü* or the *shêng* to be played without leaving at least two different sorts of pipes open, it must be assumed that harmonic intervals, probably fourths and fifths, were in use in ancient times. If this is so, then it is the earliest known use of harmony in music. Exact tuning was developed through measuring by pipes of certain lengths and thicknesses and also by filling the pipes with a certain grain which is extremely even in form. The grains were laid lengthways, sideways and corner to corner, three different measurements which had to check, before a pipe was considered tuned. Music was classified according to instruments and instruments according to the materials used in their building. The classic materials were silk, bamboo, gourd, metal, stone, skin, earth and wood. This division still plays a most important part in Chinese musical theory. Many different scales were invented in the course of time, some with equal, some with un-

equal intervals and with varying numbers of tones—12, 18, 60, 360 and so on. It is not known whether all these scales were actually used or remained only theoretical. In any case musical cultivation reached its height in the Tang dynasty, when the emperor's orchestra was reported to have contained over 600 musicians. After this time (about 700 A.D.) music became in less repute as a cultivated art and also became subjected to many outside influences from Manchuria, India and Turkestan. New and simpler scales such as the five-tone and seven-tone scales came into use. The classical standards were somewhat preserved in the temples but the folk music was quite different. The opera drama, which is the most familiar form of Chinese music to the westerner today, is of comparatively recent origin, partly Chinese and partly Manchurian. It makes use of a scale of 5 fixed tones and of conventionalized curves (*glissandi*) of sound, which are used to slide into or away from the fixed tones. In the older form of such dramas more curves were used. Only men were permitted on the stage, taking female as well as male parts. In the modern form women are permitted to take parts, and the music is simplified into fewer curves of sound. The rhythm of modern Chinese music is almost exclusively in duple meter, with use of even divisions only. Little or nothing is known concerning the rhythm of the classical music. According to E. M. von Hornbostel, Chinese classical music is not to be found anywhere in China today; except in the temples, which have preserved a little of it in an impure form. This ancient music, however, may still be found in certain places in Korea, where it has been better preserved.

Arabic music is based upon tonal and rhythmic systems similar to those of India, varying somewhat in actual content and greatly in philosophical connotation. Nevertheless, they employ far fewer scales or modes and have fewer different rhythms. The music current in Persia, Turkey, Egypt, in fact practically the whole Near East, is of Arabic derivation. The problem of the eastward extent of the Arabian influence is still in the controversial stage but some writers find Arabian-Islamic influences as far as Java.

Japanese musical theory comes from that of China, although its application is to scales which probably existed previously in Japan. There are about seven different scales in use, none of which is like any Chinese scale; but the method of tuning is taken from ancient Chinese theory.

The types of instruments used are Chinese in origin, but have been much altered. The Japanese have greatly simplified all musical materials. Their aesthetic feeling is to suggest as much as possible with the least possible means. To accomplish this they have abandoned all but one musical instrument of each type; they eschew mathematical theory in favor of expression, employ but few different scales and rhythms and favor an attenuated tone quality. The singing voice in Japanese music must be very restrained and in the throat to be considered expressive. In singing, flute playing and on the *koto* (a zitherlike instrument) very delicate, slow curves of sound are employed as a fine art. Another fine art in Japan is the singing together with an instrument, both performers taking the same melody but with slight deliberate tonal and rhythmic differences between the voice and the instrument.

The music of Java has been influenced by Indian theory, which has been applied to indigenous Malayan types of melodic percussion instruments. A large number of these are used together forming a *gamelan*, or percussion orchestra. There are only two different scales in general use: *slendro*, with 5 equal steps to the octave; and *pelog*, with 5 unequal steps to the octave. The exact tuning of the *gamelan*, however, differs slightly with each one which has been constructed. The meter is mostly duple or quadruple, low instruments playing long notes, medium pitched instruments playing notes twice as fast and high instruments playing four times as fast. Certain conventionalized variations are added, however, in a partially improvised manner by the players. The classical music is formal, of the court and sacred. It is a specific language; each tone as played on a certain instrument has a certain meaning dependent upon the rhythm, and there are certain unplayed sacred tones in both the scales. Many of the percussion instruments are constructed so as to sustain the tone a long time. The drums which are used with the *gamelan* are played in a highly syncopated manner against the rhythm of the other instruments and sometimes play a slow three against the quadruple rhythm of the rest. The Sundanese music of western Java is quite different and uses a scale like the Japanese *kumoi* scale.

Balinese music is very akin to Javanese, from which it doubtless sprang; but it has retained more ancient instruments and practises than has Java, where there have been centuries of Moslem and later of Dutch influence. There is, however,

less formality in Balinese music. It is a continuation of the classic traditions, but is used as folk music as well as ceremonial music and has attained a great spontaneity of rhythm and dynamics. The use of pianissimo, fortissimo, crescendo and diminuendo is equaled only in western European music. While different names are applied by the Balinese, the scales and most of the instruments are the same as in Java.

Siamese music, a highly cultivated art, has been influenced by Javanese, which was introduced into the Siamese court at an early date, and also somewhat by Indian and Chinese. It has adopted a scale of 7 equal tones to the octave, which means that each interval is about three quarters of a European whole step in length. It is sung mostly unaccompanied in conventionalized curves of pitch, with interludes by a small orchestra of flutes and percussion instruments. A scale with approximately the same intervals is to be found in music from Africa, the South Sea Islands and Brazil, wherever pipes are played. Von Hornbostel has advanced the theory that when the pipes are played, the energy necessary to produce the fifth above by overblowing sends the fifth a bit too low in pitch making 678 cents instead of 700. Theoretical projection of a series of these fifths produces, after 23 progressions, a tone which, when octave reduplication is not considered, differs only by 6 cents (approximately $1/34$ th of a tone) from the octave of the fundamental of the series. He has built a scale from such fifths and finds that its even, odd or mixed degrees closely approximate the actual scales of the Siamese, Javanese and other peoples.

Of great importance to oriental music as well as to the music of Africa and the South Seas has been the existence since ancient times of a "sacred tone" in Tibet. This tone, a specific pitch (approximately 366 vibrations per second, nearly middle F), was known only to the priesthood, who spread it over Asia, Africa and many South Sea Islands. There it still exists as the foundation of all scales and is taught by one initiate to another as a sacred secret. The pitch is usually preserved by means of a pipe or bell which is in the possession of the high priest and is brought out only upon special occasions.

These theories of oriental music are not always found perfectly exemplified in actual performances. In the classical arts of music attempt was made to carry out the theories but with varying success. The folk music is not based on the theories of the classical music. It is freer

and varies greatly in different localities even of the same country. In recent years occidental music has had a wide influence on all oriental musics, with a resulting destruction of the purity of many oriental arts in different ways and to varying degrees. The older oriental modes have been carefully preserved by the finest oriental musicians and by scholars; but less cultivated performers have often degenerated into transposing their music to fit occidental instruments and notation in such a manner that the original and indigenous concepts are lost.

HENRY COWELL

OCCIDENTAL. The history of occidental music is drawn from four sources: instrumental remains, which date as far back as the bone flute of the Magdalenian epoch in France and Switzerland; sculptural and pictorial remains, which show in the harps and lyres of the ancient Sumerians, approximately 3500 B.C., a highly developed art of music; monuments of language art—poetical allusions as early as Homer and Hesiod, documentary, philosophical and scientific records from the great days of Greece; specifically musicological works, of which the fragments of Aristoxenos are the earliest, about 300 B.C.; and music notational remains—the oldest, a Delphic hymn to Apollo of the second century B.C., although a fragment in a later, Augustan hand, points to a textual origin of about 400 B.C. In regard to the first two sources the data are so recent and are accumulating so rapidly that no comprehensive review of them can be made at the present time. In regard to the third it is of the highest importance to understand the nature of two conflicts inherent in the source itself: one, between the historiographical and systematizing orientations; the other, between both of these and the art of music. As to the fourth, although the monuments of language art had themselves received frequent publication and continuity of study from the earliest times, it was not until about 1800 that the monuments of music notation received either publication or study, except in an extremely limited way. Up to that time, for over 2000 years, musicology had, it is true, looked back to “olden days” in which the music had been of another sort; but the whole interest was systematic—an attempt to deal with a contemporary art. It is no wonder that when the historical viewpoint finally came into its own it was occupied with the wealth of accumulated data—the events—to the exclusion of the proc-

esses that underlay them, of its own role in the situation and, often as not, of the contemporary art of music. Toward 1900 Riemann and Adler attempted comprehensive systematizations but failed to reach the music of a generation later than that of their fathers. For while the belief in the doctrine of progress was general in regard to music during the nineteenth century, it tended in musicology as in some other fields to be interpreted only as progress up to but not out of the century. Thus, in this as in the preceding period, change in musical technique or style was for the most part combated by the musicology of the day. Soon after 1900, however, the bulk of publication was completed and since that time more and more attention has been given to reconciling the two opposed viewpoints—the study of the past in the light of the present and that of the present in the light of the past. Musicology, for the first time on a large scale, is coming to be not only a conservative factor in music but also, through recognition of musical change as a normal process, a directive force in experimental composition.

Music-notational remains up to and including part of the Renaissance are mostly of cultivated or “art” music. For this reason there is a tendency to overemphasize its importance and to mistake its history for the history of all music. The primitive music of Europe is utterly lost; notational remains of its folk and popular music begin only with the Renaissance and are not abundant until recent times. Art music is the product of a continuity of learned and refined discipline and is pursued as a profession. Where art music has developed, the primitive music has always, so far as is known, continued for a while; but as soon as the differences appear evident interaction of the diverse trends sets in. Either the primitive is modified or new, hybrid types, the product of both, appear between them. These are ordinarily called folk music—one of the most abused categories in musicology.

The inherent fallacy is that folk music is the basis of art music. Often its influence is strong; but it has always been, to extents which can never be calculated, itself a product of art music, and art music usually influences it. Folk music appears to have two distinct trends, one back to the primitive and the country, the other toward art music and the large city. When a professional or semiprofessional class produces deliberate composition in either of these types

of idiom, it is called popular music. Such, for example, is jazz.

Greece. Music, together with singing and dancing, was given a place at the Olympic games as early as the eighth century B.C. Terpander, who won a musical contest in Sparta about 675 B.C., was the first of whom there is historical mention. Timotheus was exiled for modern tendencies in the fourth century B.C. By music the Greeks understood an art of melody closely integrated with language—as, on the one hand, in the drama with poetical declamation, gesture and movement, and, on the other, in science and philosophy, hence with the affairs they governed, of the state and of social life. The art was roundly developed. Upon equal terms a tonal and a rhythmic system, the former regarded as female, the latter as male, were utilized in song frequently accompanied by the harplike cithara, lyre or aulos (a small pipe). Unison and octave singing was the rule and while the accompaniment was allowed to depart at times from the melodic line, it is now generally conceded that an independent accompanying part was not recognized, at least formally. A letter notation was used for pitch—one series for the voice and another for instruments—and there were rhythmic signs for proportion (relative duration of tone), stress and rests. In the linguistic systematization of this musical system a consistent development covering a period of approximately a thousand years can be traced from the sixth century B.C. to the fourth A.D. How accurately it describes the music of the period is not so clear. If the discrepancies between modern theory and practise are considered the reports of the Greek theorists cannot be entirely relied upon. The distinct cleavage between the tradition of Pythagoras and that of Aristoxenos is paralleled by the modern controversy between the non-musical and musical points of view. But underlying both is the thoroughly Greek belief that between the order of observable nature and the psychology of man that makes and reacts to music there must be a direct correspondence. The term ethos of music covered not only a general theory of the social function of the art as a whole but also the social valuation of specific technical devices within the art itself. Thus definite characters were attributed to the various modes. For example, music in the Dorian expressed, and therefore stimulated, the poise in a man that renders him superior to the blows of fate; the Phrygian was an incitement to wild passion

and ecstasy; the Lydian was tender and intimate.

Rome. The Greek tradition, especially in its musicological aspect, flourished in Alexandria as late as the fourth century A.D. But by 500, Boethius, perhaps the most important Latin writer on music, had already lost an understanding of the notation and misnamed the modes. Pagan Rome imported Greek music and theory along with the rest of the Grecian culture. Its genius, however, was to invent a music of its own rather than to continue in the Greek tradition. Instruments were strengthened and massed in large groups. Military trumpets and the hydraulic organ made music in the circus. At banquets, orgiastic improvisations resulted in mixtures of styles that shocked the serious minded. Comedy and tragedy degenerated into *mimus* and *pantomimus*—musical farce and pantomime ballet. Music, instead of being viewed as a social discipline, served simply as entertainment and pleasure. Meanwhile the inheritors of the philosophy of the Greeks became more and more interested in the religious view of life. Plotinus and the neo-Platonists saw in music an aid to the achievement of the ecstasy of contemplation. Eventually this fell in with the ideals of the Christian fathers and so the new art was born—the plainsong.

Like more recent puritanical movements, early Christianity banned music from its ritual on account of its association with the worldly life of the times. Still the power of music was held to be the greatest among the arts and it was only a question of time before the sacred texts were intoned. A musical revolution set in as an accompaniment or expression of the religious and social overturn. It was rigorously controlled by non-musical factors, for music had to serve to arouse the penitential attitude.

The musical influences in the early church must have been as various as the origins of its members. Greek professional musicians probably contributed to the new style and Orphic sects probably brought in more of the Greek art. But mixed with this can be detected the temple and synagogue music of the Jews, while the influence of primitive musics from Asia, Africa and northern Europe must have been considerable. Four types of chanting developed but the main body of material is Gregorian. Its composition and compilation was complete by the end of the seventh century, although additions were made at later times. Originally there were four classes of singers: the people, the choir, the

chanters and the soloists. There were two distinct types of song: responsorial, developed from the recitation alternated with brief answer; the antiphonal, or melodic alternation between two choirs. The essential element of the style is an austere and dignified intoning of the texts upon more or less fixed pitch centers, varied with departures, usually very legato (sliding), at the ends of phrases and sentences. As the skill of the singers increased, virtuosity appeared. Unusually long breaths, high and low tones, trembling, shouting, gasping and choking were employed for dramatic effect. The higher authorities stepped in now and then to put a stop to excesses.

Unlike the Greek music, plainsong did not represent a well rounded growth. It was too highly specialized. It was to too large an extent a negation of secular music—a determined exclusion of the recurrent rhythm of the dance or, possibly, of the balanced phrases of popular song. It was primarily a prose, the tones following the inflection of speech and the rhythm being likewise a speech rhythm. Metrical hymns gained admission in later days but could not alter permanently the basic character. It was above all, however, an art music and did not present a system of music or yield gracefully to systematization.

The notation of the plainsong was based upon a principle entirely new to the Greek practise. It was diagrammatic rather than symbolic, standing for the melodic unit as a whole rather than giving two separate representations, one for the tonal and the other for the rhythmic material, as did the Greek notation. It developed from a practise, which originated early in the history of the church, of interpolating certain written aids for the reading of the sacred texts, which were in Greek—marks indicating, in the unbroken stream of letters, the pauses and the raising and lowering of the voice. From them developed the Greek accents, marks of punctuation and the plainsong's neume notation which developed later into the notehead and stem. Unfortunately the history of western European music is practically barren of records of any kind from the sixth to the ninth century and that of the Byzantine church equally so from the fourth to the thirteenth; and it was just at this time that the final touches were put upon the neume notation. Such historical records as are found after this hiatus indicate several new and fundamental changes. First, the concept of high and low in pitch is graphically repre-

sented by up and down upon the written page. Second, the music for which the notation was devised is already profoundly disturbed by the singing of it not only in unison and octaves but in fourths and fifths. It is not known whether this practise was an intrinsic development of European musical technique or whether it was in whole or in part borrowed from Moors or eastern invaders. It, however, virtually sealed the doom of the old style and ushered in a new one, based, it is true, upon plainsong melodies but altering them in the process of adding to them and finally making the additions the end and dispensing with the plainsong entirely.

Middle Ages and Renaissance. The new style—polyphonic, contrapuntal, choral—fell into its stride with the invention, attributed to Guido d'Arezzo, early in the eleventh century, of the staff line, scratched or drawn across the parchment and representing throughout its length one definite pitch, the letter for which was given as a key or clef at the left. The neumes, which up to that time had been vague as to pitch interval, became quite accurate in this respect, especially after more lines were added, often in color. It remained for the neume to acquire more accurate rhythmic measure, for it was a unit diagram indicating both tonal and rhythmic functions. Thus was lost the basic gain in the change from the Greek to the plainsong notation. The curves were severed into discrete or articulated units of pitch, to each of which time duration units could be assigned. If instead there had been invented staff lines for rhythm running up and down the page at right angles to the staff for pitch, the neumes could have been continued and Europe would have had in the tenth century all the essentials of the twentieth century graph notation, the first scientifically accurate means of recording music. But scholasticism stuck doggedly to the task of making the music, which was more a sliding, unarticulated than a gap skipping, articulated tonal and rhythmic process, appear at least on paper to fit the almost unintelligible theory of the lost Greek art.

The higher ecclesiastical authorities usually opposed innovations put forward by the musicians, but when resistance seemed to be no longer practical, they gracefully adopted the new devices as part of the august tradition of the ritual. Absolute control by the church was gradually relinquished during the five hundred years after 1000 A.D. Church composers wrote secular music. They also introduced secular

tunes into the church music. Even more, in the thirteenth century in the form known as motet two secular tunes, street songs or love songs could be blended, with their original words, simultaneously with a free treatment of a traditional chant in Latin. The preliminary measuring of rhythm was effected only in the course of several centuries. Five or six rhythmic modes were established to accompany the eight (theoretically, fourteen) tonal modes. From the twelfth century on, the exploration of the technical resources of choral polyphony was practically unhampered by any non-musical considerations. It was then that musicians established the notion which has endured to the present day: that technique in music evolves according to its own laws and that musical value consists solely in technical excellence.

Of the many accomplishments of the period from 1000 to 1600 two stand out above the others, the establishment of the *trias perfecta*, or consonant triad, and the concept of organic musical form. By the sixteenth century the musician was in full command of all apparent controls of his art. The ecclesiastical authorities no longer interfered. They simply accepted what the musician gave them in the way of music and from then on, throughout western Europe, secular requirements occupied the attention of the most talented musicians.

In the secular antecedents of the feudal system music had occupied an especially high place. It was one of the duties of the churchmen to demote it, if not to abolish it entirely, and to supplant it with their own music. The old heroes of Teutonic mythology were reputed able to fight all day and then gather around the banquet table and sing of their deeds far into the night. In later days a special class of bards came into being which sang of warriors and princes. Descended on the one hand from the bards and on the other from the Roman comedians were the mediaeval minstrels. Besides their function, as singers of the ancient days, they were often general entertainers, acrobats, jugglers, quacks and rogues. Under the ban of the church, they were nevertheless the news conveyers of the day and flourished down to the fourteenth century. Another group, educated somewhat in the church learning and technically clerics, were the Goliards, or *clerici vagantes*, some of whose songs are preserved in neumatic handwriting from as early as the ninth century. Besides history, their subjects ran from praise of wine and women to abuse of

the churchmen. In the twelfth and thirteenth centuries a type of secular song, connected with the institution known as the court of love, was composed by the knights and princelings of Provence. They called themselves troubadours and their verse shows indubitable Moorish influence. The songs were accompanied upon the lute, which was derived from the Arabian *al 'Ud* and remained popular well into the seventeenth century, but the attempts to prove Moorish influence in the music have not been well received. The notation, of which there are many survivals, shows a basis of plainsong. Shortly afterward in northern France there sprang up a similar movement but more allied with church learning and the well to do bourgeoisie; its participants were known as trouvères. Both troubadours and trouvères had their music performed by a class of professional musicians which eventually replaced the minstrel class. In Germany at a somewhat later date the parallel groups are referred to as Minnesinger (nobles) and Meistersinger (burghers). It is difficult to say to what extent the crusades influenced western European music. The high development in secular music throughout the world of Islam must have impressed the musically inclined of the soldiers and knights. Pictures of European festivities at which the musicians are clearly Moorish are not rare. European musicians studied at Moorish universities and besides the lute there were in Arabian musical instruments of the period plenty of prototypes of the ancestors of the violin family. Furthermore, the knowledge of Greek and hence of the Greek musical theory was kept alive before the Renaissance in Ireland, Constantinople and Arabia.

An outstanding factor in the music of the Renaissance was the growing popularity of instrumental music and the improvement of musical instruments. The pipe organ, which in the eleventh century often had keys three feet long and employed a drop of one foot (replacing the older device of slides) became by 1600 an instrument with pedals and keys approximately as they are today, with three manuals, dozens of stops, and pipes up to thirty-two feet in length. The viols, ancestors of the violin family, were capable of rendering fine concert music and there were whole "families" of large, medium and small wind instruments combined sometimes into sizable orchestras. The predecessors of the piano, keyboard instruments with strings, the harpsichord and clavichord, were

perfected to a degree rendering them capable of performing music of the utmost delicacy, judging by our modern standards. The technological advancement must have been very rapid. In keeping with the taste of the period in other respects, the instruments were made in the most fanciful designs and often decorated by fine painters, using plenty of bright colors and gold. Wood predominated as a material of construction in all except organ pipes and the trumpet and horn family.

Modern Period, 1600-1900. The stylistic changes that took place around 1600 are comparable in magnitude only to those of the tenth century and possibly of the twentieth. Unstable elements of the choral style—the concepts of the chord and of organic, independent musical form—were the materials of an experimental trend in northern Italy. It was made possible by noble patronage and freedom from ecclesiastical control, and the improvement of instruments, especially of the keyboard and the violin families, made it practicable. A serious attempt was made in 1594 to reconstitute the Attic drama, but within a few decades it was transmuted into what became known as opera—a concert in costume with gesture and some action limited by rigid and formal rules of procedure. As if to offset this tendency to grandiose display, which sometimes imperiled the solvency of royal courts, there developed during the seventeenth century a type of music on a smaller and more intimate scale—chamber music. A number of the older instruments, the spinet, clavichord, lute, viols, continued in use into the eighteenth century. But the change in the character of the audience from a small company of nobility in a small room to a large number of burghers in a large hall inevitably led to a gradual displacement of these delicate instruments and to the transformation of European music from a domestic to a platform art. Church music and oratorio (opera with sacred text but without costume or action) took on a similar character. The *Zopf*, or rococo, period, which with its frivolity of detail tended to weaken architecture, painting, poetry and some of the crafts, resulted, on the other hand, in a more powerful music. In spite of the profusion of filigree, Bach, Handel and their French contemporaries are today as highly regarded as any composers in history. The chordal system, built up throughout the seventeenth century, formed a firm structural basis for what might have been a fatal blemish. Composers of otherwise diverse

origins, environments and tendencies showed uniform and consistent understanding of its use, although theorists have never succeeded in giving a concise or comprehensive account of it. Counterpoint became dependent upon the chordal harmonic system, and form was envisaged more and more in its terms, resulting in a rhythmic weakness that now is being perceived for the first time.

The outstanding factor of the period was the industrial revolution. Events in phases of human life which might be considered as totally removed from the universe of music fell in with tendencies manifest in the art many centuries earlier. As a result of the technological development of iron and coal the wooden frame and thin brass strings of the harpsichord yielded to the steel frame and high tension of the modern pianoforte. Similarly, the wood and brass wind instruments underwent the complete transformation around 1800 which made possible the large symphony orchestra. The enormous increase in the numbers and resources of the bourgeoisie gave the musician an entirely new type of audience. Music printing, which had been invented before 1500, remained slow and expensive almost until 1800, when copies of the most admired music began to come within the reach of even small purses.

The revolt against the rococo was effected suddenly and completely. Within a few decades after 1750 the "old music" was displaced and there appeared a new style, the romantic, paralleling strictly the literary movement in Germany and England. A good deal of the ornamentation of the old style remained, but mixed or alternating with it were bits of genuine folk music or inventions in that idiom showing a thorough consistency with the new social doctrines. After 1800 composers still deferred to the taste of patrons but they wrote for the public, whose growth fostered larger ensembles and longer compositions. The necessity of almost mechanical timing in execution involved preparation, discipline and management new to the profession but in keeping with the times. Types of social organization and work, discovered in industry and merchandising, were applied to the teaching, making and distribution of music, vastly enlarging its field but exacting a return in the matter of control at least as great as had been exercised by the church or by noble patronage. Each standard instrument acquired a solo literature. What the instrument could be made to do became often more important than

what it might be musical to do with it. A vast amount of "study material" came into existence, ostensibly to give opportunity for practise in concentrated form of the difficulties to be met in good music. Years of application to the former only too often killed the taste for the latter. With public recognition and pecuniary reward for playing fast and loud increasing by leaps and bounds, the bulk of performers developed a predilection for the old as against the new. Strangely enough, in the course of the nineteenth century the musician for the first time could know that there was *ars nova* around 1300, *nuove musiche* in 1600 and *neue Musik* after 1750. The age old conviction among composers that the new was more valuable than the old was seen to have historical grounds. But not everyone recognized this fact and thus there arose a conflict between composers and performers and, since the public followed the latter more easily, between composers (those who were not imitators) and the public. From about 1830 practically every composer who has later been accepted as worth while has had to face abuse and discouragement, not only from ignorant dilettanti but also from the music reporters on prominent newspapers. The customary defense of the composer rested upon the claim that the unusual and gifted man must at first necessarily be misunderstood by the vulgar, whose opposition was supposed to steel him for higher endeavor. There can be no doubt that while there may be some truth in this theory it has in practise caused the loss of many forward steps and the payment of too high a price for what has been accomplished. The belief is consequently widespread that it is easy to achieve something new in music and that the composers who try to do so are therefore insincere and worthless. The cure for this ill is the removal of the point at issue from the field of individuality and its discussion in terms of the wider world of art change.

At any given time there are diverse trends in the art, varying in momentum and direction. If one man does not carry them on others may. If none do stagnation may ensue for a while. Of course it is not desirable for the composer to run too far ahead of his audience. Audiences should, however, not run too far behind their composers. The composers in all bourgeois societies are the leaders and it is incumbent upon audiences to accept them as such.

During the nineteenth century nationalism came to be accepted as a quality to be delib-

erately cultivated in music, and it was encouraged in each European state by government grants and by the exclusion of foreign art. On the whole, the use of the term nationalism in connection with music is too facile: in regard to art music, differences too small to be worthy of attention often become unprofitably magnified; and in regard to folk music, widely dissimilar practises become too vaguely lumped together. The plainsong was an Italian music thrust upon all of western Europe by Rome. The art of choral polyphony that grew out of it, however, was truly international in western Europe. The opening of the seventeenth century saw the rise of several distinctly national styles—among them the English madrigal and the Italian opera. The former went down before the Commonwealth; and later the whole great art of music in England died with the advent of the house of Hanover. Italian opera bid fair to rival the spread of its predecessor, the plainsong, but German instrumental and concerted music, growing sturdily from the fifteenth century, finally gained the upper hand with Beethoven (who adapted much of the Italian technique to his needs) and dominated the occidental field throughout the nineteenth century, by the end of which Italian opera was practically Teutonized. It was Wagner who, around 1850, made German music conscious of its nationality. Besides being one of the most successful innovators in the history of musical technique, his views on the "marriage of the arts" and his correlations of music with philosophy, history, literature, religion and the destiny of the German race were widely publicized. Moussorgsky, although in a different way, defined a Russian nationalism in music, but it was not until after 1900 that strong French and Russian schools became a serious challenge to the German art, which had almost come to be regarded as a universal one. American music is scarcely to be defined at the present time. Survivals of the folk and popular music of many European lands are still to be found in out of the way places and some distinctive developments in those types have appeared as indigenous growths. The Negro work songs and spirituals, the cowboy songs, the fiddle, banjo and mouth organ music of the Atlantic states, all contain germs which may grow into art forms but have not yet done so. Only jazz, a hybrid of various local strains and European art music, has spread beyond the borders or claimed more than local and temporary attention. But occidental cultivated music shows

and always has shown that it is one art, although it has many "dialects" which are termed national arts. The folk music of the various nations vary far more widely. Within the boundaries of one nation can be found folk musics which differ more from each other than any two national cultivated arts. Indeed some European folk musics are as different from the contemporary occidental cultivated art as are Chinese or Japanese art musics. As examples may be cited the Serbian singing with *gusla*, the Pyrenean bagpipes or Irish keening.

The Twentieth Century. One of the most outstanding characteristics of the early twentieth century is the fact that for the first time music has become a mass commodity. The music business, its ramifications in the theater, the cinema, the publication field, instrument making, advertising (especially in broadcasting) and, last but not least, in education, is becoming organized upon a large scale. Business, as at present understood, aims at profit for services rendered. In such a field as music, business will try to give the kind of service that brings the greatest profit. It is dealing no longer with the small circle of educated amateurs. It is selling virtually to the whole population. Business will say that the taste of the population will govern the service rendered, but will it not read that taste as being of the kind that keeps business going? In other words, will not the technique of this particular kind of production and distribution tend to continue the type of music which brought it into being? This type is constituted chiefly by that part of the bourgeois music which entertains and gives pleasure. If the taste of the population were sufficiently educated no fault could be found in the situation, except that progress, if there be such a thing, or mere change, which certainly has been the rule in occidental music for the last thousand years, might slow down or cease altogether. Not all musics change as rapidly as has the European. Most of the Asiatic arts seem to be highly conservative in essence. The control of music, then, by large amalgamations of educational, manufacturing and distributing institutions, is a reality which must be faced. Greece may have had its socio-political control of music, Rome its socio-religious, the musician of the Renaissance, rococo and romantic periods his heyday of technical autonomy, narrowed though it was by an unavoidable deference to elegance of taste of noble and wealthy patron-amateurs; but it has

remained for the twentieth century to propose and commence direct economic control. This phase is especially interesting in view of the efforts brought to bear by Soviet Russia and Nazi Germany toward the building up of proletarian and "totalitarian" musics. Conservative and even liberal musical thought in Europe and America have been very prompt in condemnation of this development. Historically there is no reason why it should not be attempted and nothing to prove it cannot be done successfully. There are said to be only two kinds of music—good and bad. Despite the fact that much music lies in between and that much is very difficult if not impossible for contemporaries to classify, the two old questions still obtrude—good and bad as what? Good and bad for what? Much good music was probably discarded in the past because it was held not good for Greek soldiers, Christian penitence, bourgeois comfort or the box office. But, on the other hand, much good music was written and retained with those requirements very much in mind. No one can successfully maintain that better results came from adherence to purely intrinsic musical standards than from control by any or all the chief extrinsic ones. There is no record of the absolute control by any set of criteria. But there are plenty of examples of the temporary predominance of one or of a set of them.

Besides the conservatism of economic control, conservative and even reactionary individual psychological set ups may be expected during the next century to apply an unusually strong brake to musical innovations. But against these forces that bind men to their past—to its weaknesses as well as its strengths—there are several very powerful agencies of change, and indeed of very rapid change. First, there is the experimental mood in musicology and composition: the musicologist sees in occidental music a very unbalanced technical and critical situation—some functions and resources are badly overdeveloped at the expense of others that are underdeveloped, as, for instance, chordal practise on the one hand and rhythmic form on the other; while the composer, stimulated by the history of the successes of former experimenters and by the refreshing beauties of exotic musics, with which the Occident is becoming for the first time acquainted, still shows strong revolutionary spirit. Second, the very means which make possible the large scale commercialization of music—the mechanization of performance—contain within themselves po-

tentialities for musical change which are almost completely ignored at the present time. Every important step in the history of music has been accompanied by change in the instrumental means of performance. The constant factor has been the solo human voice, although even this has changed gradually in regard to the manner of its use. One of the most powerful factors in this history has been the capacity of the instruments. At first the violin, the organ, the wind instruments, the harp, lute and dulcimer groups, seem to have been restricted to the emulation or imitation of something the human being could do, or could suggest doing, himself. The electrical instrument seems to be in this stage now—it is used simply to reproduce, convey or imitate music made by hand or throat. It is already possible for the machine to make music with nothing in the way of human interference, once the initial controls have been set. Such music could be absolutely unperformable by human beings. Indeed its first embodiment in sound need not occur until it is picked up by a broadcast receiving set. Whether this possibility will be exploited cannot now be determined; but history provides one clue, whose implications, if they continue in the future to operate as they have in the past, may serve as a guide. As has already been pointed out, in the early Christian times instruments were tabu on account of their abuse or their association with social usage that was tabu. By 1000 they were reintroduced as an aid to the very ritual that had excluded and tried to abolish them. Soon after 1600 instrumental music was at least as much prized as vocal and the technique of music as a whole from then to 1750 was a mixture of the two, with the former as the dominant and the latter as the recessive characteristic. After 1750 instrumental music was in the position of superiority that vocal music occupied after 1000: it was supplemented by the voice, but even the voice was instrumentalized. Instrumental music still had a human performer who touched the instrument with his hands or lips. Soon after 1900, however, there began to appear instruments which copied or recorded music made by human beings and then performed it automatically. The last step in the cycle still awaits completion or rejection—the machine which coordinates its own music, once the controls are set to a pattern and the switch turned or arranged to turn. The question may then be asked whether in such a musical regime there

would be a renewed interest in the single, unaccompanied human voice, singing for one or two or at most a small group of listeners without any thought of public criteria, and whether there is any likelihood that it will eventually displace the interest in mechanization. The matter is purely speculative from this point on. But it must be remembered that in all art, as indeed in science as well, speculative considerations are of vital importance and tend to be ignored by the overemphasis upon facts in contemporary culture. It is quite conceivable that some day speculative musicology may again be valued even more than historical. The musicology scale has customarily tipped far to one side and then far to the other, appearing to regain balance only to lose it once more. One of the first concerns of a coordinated body of musical learning should be the invention of a stabilizer.

Social Status of Musicians. Very close to the question of the social versus the technical control of music is the question of the place of the musician in society—the place he is conceded, the place he desires to win. In the more complex cultures it is on the whole not a high one. Among musicians the man with exceptional talent is of course very highly respected. The general estimation in which the musician is held seems to depend in part upon the degree of musical cultivation of the judge. In those primitive societies in which the social functions are not much differentiated or are very unequally distributed among the members, and in which everybody sings and plays, those who cannot make music are in the minority rather than in the majority, as in the civilized world. Appreciation of exceptional talent is by connoisseurs rather than by amateurs. For in primitive cultures music accompanies most of the normal activities of the individual and of the group, whereas with us music making for anything but entertainment is increasingly differentiated. In certain comparatively early stages of culture, music may be preempted by a powerful class, but the maintenance of class superiority upon a musical basis is not often found. The power of the medicine man seems not to be elaborated in more complex stages. Sooner or later the musician becomes an honored associate, a retainer, a servant. Whether musicians are judged to be better or worse off for this classification depends upon the standard. Examples of their great good fortune at the hands of music loving tyrants, high priests and ruling classes are not

unknown. But the attitude fostered by the absolute monarchies from the Renaissance to 1800 and continued by the liberal democracies of the nineteenth century makes it quite clear that the enjoyment of music of the best sort was proper to the noble and wealthy while its composition and performance were expected of a lower class. Until about the close of the sixteenth century the youthful musician was apprenticed to a professional. If he were an orphan he perhaps received his education in the conservatory as late as the seventeenth century. But in either case he was later dependent upon a patron, a noble or wealthy amateur who respected him as a musician but regarded him as a social inferior. The romantic movement took in hand the resolution of this paradox. Beethoven was one of the first and most powerful rebels against the patronage system. While he relied upon the help of patrons he was explicit in his opinion that there were many princes but only one Beethoven. The final triumph of his viewpoint has occurred only recently: the children of the wealthy and socially privileged may now do their best in music with comparatively little hindrance. But it is still difficult for that best to rank very high. Artists of such origin find in the other arts easier paths, although in none of them does it seem that independent income or unusual social prestige is other than a drag. The evidence seems to point conclusively to a connection between music making and the feeling of its social function that can be impressed upon the musician only by the necessity of his earning or receiving his living thereby. The situation is complicated at present by the fact that many members of the more submerged classes definitely look upon music, and upon the other arts, as a means of social advancement. The mere size of the pecuniary emolument of some of the outstanding performers of the present day is another confusing element. The possible rewards of successful composition and successful performance are entirely out of proportion. Judged in the light of history, performance is the lower category, but it is universally the fact that some of the best composers can at present make a decent living from their composition alone, whereas even the rank and file of performers could, until the invasion of their field by the mechanical instrument, gain wages far above the minimum living, and the most successful ones very respectable incomes, comparable to those of men moderately successful

in industry, banking and commerce. This has been especially true in the United States, where the position of music has been since colonial days a peculiar one. The extension of the copyright laws to include rights of performance may, however, radically alter the economic status of the composer.

Music in the United States. The early American colonists did not cultivate music to the same degree as their contemporaries in Europe. Some of the groups, such as the Puritans, were hostile to all forms of music except the hymn. No professional musician class existed for the first two hundred and fifty years of North America or for the first three hundred and fifty in Central and South America. Popular music thrived. During the second half of the nineteenth century energetic efforts to make good the deficiency were initiated in all departments of musical activity. Concert and operatic tours, music education in the public schools, professional music schools, music stores and publishing houses sprang up almost overnight. A chaotic, undisciplined musical life came into being which began to strive toward European standards of excellence only by the twentieth century. Performers were brought over in such numbers that the labor problem became acute. Organization into unions affiliated with the American Federation of Labor finally bettered the economic situation but produced some historical novelties whose effect cannot yet be appraised. The problem of wages was settled upon a time basis: for a performance and a certain minimum of rehearsal a certain wage was paid. This worked out satisfactorily for the employer of players in restaurant and theater bands; he obtained rather perfunctory performance at a price he could afford and the musicians were protected against long hours. It did not, however, prove satisfactory in more artistic fields. For more serious concerts it was in many cases impossible to pay for extra rehearsal time, so that performers rendered, and audiences became accustomed to accept, slipshod work. Moreover both performers and listeners tacitly gave consent, on the one hand, to the cluttering up of programs with music of a type easy to rehearse and, on the other, to the avoidance of more highly elaborated music. Wealthy patrons of opera, symphony and chamber music offset, although only in the larger centers, this unmusical state of affairs. It is difficult to offer another alternative for the unionized musicians. Perhaps a more flexible wage scale and a more

critical scrutiny of musical values might have saved them. But working conditions were undeniably bad, and, with the mixture and conflict of musical traditions among the imported musicians, a garbled and vulgar degeneration of taste had set in. The brief improvement of the lot of the rank and file musicians was, however, ended by the mechanical instrument. So poor was the music of the average restaurant and theater orchestra that the phonograph record, "talkie" or radio performance of a single well rehearsed and competent band was hailed as a blessing by employers and public alike. The invasion of the music field by labor saving devices and quantity production has resulted in the advancement in economic and social status of the best, the more conservative or the cleverest musicians, and has thrown out of work or into other employment tens of thousands of others. Meanwhile outside of the large cities the great musical culture of Europe is being spread for the first time. So momentous a process cannot be gauged at so close a distance as the present. That music loses certain qualities in the phonograph record, the sound film and the radio broadcast is undeniable. So too it experienced a loss soon after 1600, when the dead materials of the music instrument supplanted the living vocal chords of human singers. But later generations found that the music of Bach, Beethoven and Wagner was good, in spite of the predominance of instruments; this was largely because after the initial period they did not expect the instruments to play vocal music. It is probable that there will be an initial period when the new contemporary instruments will play "hand made" music. They may be expected, however, to have their own music soon.

The strongest hold of the individual musician upon music is in improvisation, for there he acts as both composer and performer in the creation of music that is unique and of the moment, unless, by modern devices, it is recorded. Skill in improvisation was part of the activity of the well equipped musician at many times past, but it died out during the nineteenth century in Europe. Elaborate ensemble music cannot be totally improvised by one man. But he can direct it, as does the drum player in Javanese *gamelan* playing. The electrical instruments offer a vast new field to musicians and an audience for a single performance which might conceivably comprise the inhabitants of the globe.

The education of the amateur becomes then one of the focal points in the new musical situation. A moderate degree of musical literacy could be expected of all high school graduates in the United States. This does not imply that all people should appreciate all styles of composition. Some music may be heard and even performed by all; but there is no reason why some music may not exist merely for a small group. One of the chief tasks of musicology is the clarification of these distinctions and the guidance of educational policies so that they may be brought into harmony. Closely allied with the public school music movement, which is now progressing upon an ever larger and larger program, is the education of the public through the newspapers in the columns of so-called musical criticism. Most of this is at present composed of news items and rather undisciplined personal opinion. Very little of it can pretend to be called criticism, nor will it achieve such status until academic rules permit of a more serious and extensive study of musical value theory than they do at present. The worst faults in this field also underlie the efforts in musical education, as they do indeed the whole music commodity manufacturing and distributing mechanism which is so rapidly being built up. They consist, first, in an inability to cope with the analysis of technique, and this at a time when, outside of technical excellence, the only standard is the extent to which music pleases; and, second, of an aesthetics which identifies the pleasing and the pretty with the socially useful, the good, the beautiful and even the sublime.

MUSTAFA KĀMIL (1874-1908), Egyptian nationalist. Muṣṭafa Kāmil studied law in France, where he became imbued with progressive nationalist and democratic ideas. He was the first among the rising generation of young Egyptian intelligentsia to dedicate himself to the restoration of Egypt to the Egyptians. He aroused his

countrymen's patriotism through the spoken word, the schools, the newspapers and books. In *Le péril anglais* (Toulouse 1895, 2nd ed. Paris 1899), written while he was still a student, he tried to show the French that the English occupation of Egypt threatened world peace since it must lead to the seizure of Jerusalem and to the domination of Asia and Africa. Upon his return to Egypt he won the support of the students and by indefatigable efforts he established a nationalist movement. He stressed the need for popular education along patriotic lines as the most essential part of the national program and commenced his public activities in 1898 by founding in Cairo the first national school. Toward the end of his life he constantly extended his educational work; he was instrumental in the establishment of people's high schools and evening courses and in the promotion of a scheme for a national university. He took special interest in the education of girls, hitherto entirely neglected.

In 1900 Muṣṭafa Kāmil founded his own newspaper, the *Leva* (Standard), which with its subsequently established French and English editions became the most influential in the country. In the same year he formed the *Ḥizb al-waṭan* (National party), thus uniting the progressive elements of Egypt's developing middle class, which was being influenced by European thought. Until 1904, when the entente between Great Britain and France gave the former a free hand in Egypt, Muṣṭafa Kāmil had hoped for French help in ousting the British. Later he was prepared to use pan-Islamism to further his nationalist aims. He opposed in his fiery way the gradual winning of national freedom through English concessions and taught the Egyptians to seek self-emancipation. His movement emphasized particularly the indissoluble tie uniting Egypt and the Sudan. After his premature death his work was continued by the National party under the leadership of Mohammed Farid Bey, but it lost much of its impetus and ceased to play any role under the changed conditions following the World War, when, on a much broader basis, Sa'd Zaghlūl took Muṣṭafa Kāmil's place as national leader and educator.

MUTINY. The term mutiny is used both in popular parlance and in penal legislation to refer to collective disobedience to orders of officers on the part of soldiers and sailors. In old French *mutin* meant any kind of sedition or conspirative uprising of a revolutionary nature. American federal statutes use mutiny and sedition synonymously. In order to distinguish mutiny from industrial sabotage, from general disregard of orders by public officials or private employees and from other types of revolutionary behavior it seems desirable to limit the application of the term to mass insubordination of members of ships' crews and of military, naval and air forces.

Mutiny is a form of protest behavior on the part of subordinates whose normal deferential attitude toward commanders has broken down. It may consist of mass disobedience, collective passive resistance or physical assault. The preliminary breakdown of the established patterns of deference and obedience may result from specific grievances in the local situation, such as poor food, bad housing and obnoxious working conditions; it may arise because of a general lowering of morale following a long war or defeat or heavy losses; it may be a consequence of revolutionary propaganda from external sources or in itself be a manifestation of a revolutionary movement; more rarely it may be caused by private predatory purposes which can be realized only by the overthrow of the legally constituted military or naval authorities. Because of the ease of repression and the severity of punishment in highly disciplined services individual disobedience or desertion is less effective and more dangerous for disaffected soldiers and sailors than for other wage earners. Group action is therefore imperative. When personal grievances and individual inclinations to indulge in protest behavior become symbolized in terms of group interests, collective action follows either through spontaneous insubordination or through organization about new leaders who command the respect formerly accorded the officers. Because of the nature of the services in question no right to "strike" is recognized by those in authority. The severity of prospective punishment leads to fear and desperation, inspiring extreme measures, and insubordination at once assumes a revolutionary significance and almost inevitably results in violence on both sides.

The subsequent behavior of mutineers in a particular situation will depend upon the new group symbols which have become current and

upon the purposes which have been formulated. If the object is merely better food or more favorable working conditions, the mutineers may indulge only in a brief gesture of disobedience, followed either by repression or by a redress of grievances. If a mutinous crew desires to assume control of a vessel either for public or for private purposes, for example, revolution or piracy, the old officers must be subjected to expulsion, arrest or execution and completely replaced. Mutinous soldiers often kill their commanders and desert en masse to the enemy. A mutiny which is a phase of a general revolutionary situation will normally have for its objective the complete overthrow of the existing command and the placing at the disposal of the revolutionary cause of the ships or guns seized by the mutineers. Since mutiny is always a means designed to serve ulterior purposes, the forms which it assumes are necessarily almost as numerous as the purposes which may be served by collective insubordination.

Such purposes are public or political when the mutineers desire to destroy the fighting forces of which they are members or to collaborate with other revolutionaries in bringing about an illegal modification of the existing distribution of power within the state. They are private when the mutineers seek only a redress of local and immediate grievances. This is usually the situation in mutinies on private vessels. Such outbreaks were frequent when the impressment of seamen was a current practise and when conditions on shipboard were conducive to chronic disaffection. Successful mutineers often engaged in piracy or betook themselves to remote ports and disbanded. Since the suppression of piracy and the general improvement in seamen's working conditions in the nineteenth century mutinies on private ships have become rare.

On the other hand, the adoption of conscription has made the war services more susceptible to mutiny than was formerly the case. The highly disciplined professional soldiers of the eighteenth century were usually loyal supporters of the established regimes of aristocratic absolutism. When the popular conscript of the twentieth century is pitted against a foreign foe, his morale may be kept up to the level of his predecessors by the adroit use of modern propaganda technique, but he tends to be less reliable in the face of heavy losses and defeat. When he is called upon to fire at revolutionary mobs, his loyalty is much less certain than that of the

professional mercenary, for he is recruited from the populace and is easily affected by its political discontent. He has often not developed the *esprit de corps* and the unquestioning habit of obedience which offer assurance against mutiny in political or social crises.

Under modern conditions mutinies to serve private purposes are almost invariably doomed to failure when they lack the support of politically significant sections of the civilian population. The mutiny in the British navy in 1931 in protest against wage cuts is scarcely an exception, since its success was due less to the activities of the sailors than to the reluctance of the government to take vigorous repressive measures in view of the prevalent sentiment in labor circles. The serious mutinies in the British navy at the end of the eighteenth century were suppressed with the hanging of the leaders. Mutinies of war weary soldiers or sailors are unsuccessful in most instances, except where the mutineers go over in a body to the enemy or where crushing defeat disorganizes the high command and the government and leads to political disturbances. During the World War the Czech battalions in the Austro-Hungarian armies were highly successful in deserting wholesale to the Allies as a means of furthering their aspirations toward national independence. In the allied armies the various mutinies resulting from severe losses and exhaustion were not followed by large scale desertions and were readily liquidated through courts martial and executions. The mutinies in the Russian armies in 1917, in the Austrian armies in 1918 and in the German navy in 1918 were more successful because of the simultaneous collapse of governmental authority throughout the states involved. Political mutinies are likely to be successful only when they are timed to coincide with the accession to power in the state of sympathetic revolutionary forces. Instances of failure resulting from the absence of this coincidence are numerous: they include the mutiny on the Russian cruiser *Potemkin* in 1905, in the Brazilian navy in 1893 and in 1910, in the Spanish air forces in 1931 and in the Chilean navy in 1932. Conversely, mutinies coinciding with the maximum effort of a general revolutionary movement have sometimes been successful and decisive; as, for example, those of the Kronstadt sailors and the Petrograd garrison in 1917, the Kiel sailors in 1918 and various Latin American armies and navies in the revolutions of 1931-32.

The fact that rigid discipline and unquestion-

ing obedience are the *sine qua non* of all fighting services has led to the general adoption of the severest penalties for mutiny. In public military and naval forces the offense is dealt with by courts martial and is punishable by death. Mutineers on private vessels were also formerly executed but are now usually dealt with more leniently. By an act of 1790 mutinous seamen on private American ships were held to be guilty of revolt, felony and piracy and were punished by death. But by an act of 1835 there was substituted a maximum fine of \$2000 or ten years' imprisonment at hard labor or both. The federal Criminal Code of 1909 (Revised Statutes 5360, sect. 293) contains an almost identical provision and Revised Statutes 5359, section 292, provides for a maximum fine of \$1000 and five years' imprisonment or both for endeavoring to incite mutiny. The death penalty, however, remains the normal penalty for mutinous soldiers and for sailors on public vessels, although it is no longer mandatory in American and British courts martial (see Articles of War of United States, Act of June 4, 1920, art. 66, and Articles for the Government of the Navy, Revised Statutes 1624, art. 4).

It may be noted finally that modern economic conditions make rigid discipline and implicit obedience in various fields of activity other than shipping and soldiering increasingly important for the community welfare and for the preservation of the existing distribution of wealth and power. There is a perceptible tendency to regard strikes and other forms of insubordination among policemen, firemen, railroad men and public utility workers as analogous to mutiny. The labor legislation of Fascist Italy makes all strikes unlawful, whether in public or private employment. The necessity in industrialized economies for an uninterrupted functioning of essential services is likely to lead in an increasing degree to disciplinary standards comparable to those which have traditionally prevailed in the fighting forces.

MUTUAL AID SOCIETIES are associations formed for the purpose of affording their members material assistance in case of need. They are common throughout the European continent, having existed in the more advanced countries for several centuries. In Germany, Norway, Sweden, Denmark, Holland, France and Switzerland they may be traced back to the mediæval craft guilds, which besides regulating the conditions of membership and promoting trade interests usually assured their members legal protection, assistance in case of illness and compensation for loss by fire or flood. To supplement the more comprehensive craft guilds journeymen often formed societies of their own for mutual aid in sickness.

In Germany guilds were formed for either single or mixed trades and were known as closed or open according to whether the number of members was fixed or indefinite. Where they succeeded in dominating the town government and even in exercising important powers of independent jurisdiction within the trades concerned they were sometimes able to introduce compulsory membership. The guilds, however, showed signs of decline early in the eighteenth century, by which time the rulers and governments had become increasingly impatient of their pretensions. But there was no such abrupt break up of the guild system in Germany as occurred in some other countries. So far retarded was the

industrial revolution there that the Prussian law of 1845 encouraged the guilds to extend the formation of sick clubs, and only in 1854 was provision made for mutual insurance of factory workers. Following in the wake of other western countries one German state after another accepted the principle of free choice of trades, until it was legalized for the entire territory of the North German Confederation in 1869. Later in the century laws were passed for the purpose of reviving the guilds on a wider basis but without great success. In the meantime the depressed condition of the working classes, their consciousness of political impotence and their growing recognition of solidarity and unity of interest had led to the creation of a large system of voluntary mutual aid funds (*Hilfskassen*) after the model of the English friendly society. In 1848 such a society with 10,000 members was suppressed on political grounds. Lassalle incorporated the principle of mutual insurance in his Allgemeiner Deutscher Arbeiterverein. In southern Germany and in a few other states a compulsory system of parochial sickness insurance existed from the middle of the century for dependent workers and domestic servants. Brunswick, Saxony and Hanover had required all working men to insure through mutual associations before the passage of the national sickness insurance act in 1883.

In the Latin countries popular provision against sickness followed narrower lines until comparatively recent times. In France the guilds were peremptorily abolished in 1791, and the fact that there was no serious attempt to revive them suggests that they had already outlived their usefulness. In the long period of reaction which followed trade associations were either prohibited or severely restricted. Until 1848 mutual benefit societies or funds (*caisses de secours mutuels*) could be formed only with government assent. One result of the revolution of that year was the enactment of laws guaranteeing complete liberty of combination and assembly. Under the Second Empire restrictions were again introduced, but approved societies were subsidized. Only in 1898 did these organizations acquire their present status and rights. In most European countries the great majority of existing mutual aid societies and funds date only from the middle of the last century. The sequence of development has been: the free action of voluntary societies legally formed but not under official control; optional legal recognition, registration or approval, a status involving some degree

of supervision while conveying certain statutory privileges; state assistance in consideration of a wider measure of regulation; and, finally, in some cases compulsory insurance usually implemented by agencies established or directed by government or delegated authorities.

The voluntary principle still holds the field in Belgium, Sweden, Holland, Denmark, Finland, Italy and Spain, although it is usually reinforced by state encouragement in the form of subsidies and other minor privileges. A fundamental distinction is made between those societies which have received a definite legal status and are variously described as recognized, approved, sanctioned, accredited or registered and those which have not been so acknowledged and in consequence are usually known as free. Almost invariably application for legal recognition is optional. Recognized societies formed in accordance with prescribed conditions designed to insure stability and to protect the interests of members enjoy special privileges, such as legal personality, exemption from certain taxes and duties and the right to hold real estate. In Belgium, Denmark, Sweden and Switzerland they are also entitled to subsidies from public funds and in Italy and Spain to ad hoc assistance. While legislation usually leaves a society free to decide upon its composition, in France, Denmark, Finland and Belgium the recognized societies are definitely restricted to persons in a dependent position or with modest resources. In Spain mutual aid funds for sickness and life insurance are compulsory in elementary schools.

Without altogether superseding voluntary enterprise compulsory sickness insurance was introduced in Germany in 1883, Austria in 1888, Hungary in 1891, Luxemburg in 1901, Norway in 1909, Serbia in 1910, Great Britain in 1911, Russia and Rumania in 1912, Bulgaria in 1918, Czechoslovakia and Portugal in 1919, Poland in 1920, Japan and Greece in 1922, Chile in 1924, Lithuania in 1925 and France in 1930. Soviet Russia in 1923 reenacted a compulsory insurance law all inclusive in scope. It would be a mistake, however, to conclude that the obligatory principle has been applied to the same extent in all the countries named or that the laws passed have been enforced with equal consistency. Of some the best that can be said is that they are on the statute books. Where compulsory sickness insurance has been introduced the existing voluntary agencies have been used as far as possible in the administration of benefits, thus preserving established traditions and

insuring the advantage of valuable directive experience. The German law of 1883 created only one entirely new type of benefit fund, that for engineering works; a large proportion of the *Hilfskassen* were absorbed in the national system and renamed; and the old compulsory miners' societies, known as *Knappschaftskassen* in Germany and as *Brüderladen* in Austria, were left practically as before. The *Hilfskassen* continued to exist until 1911, when legally they became mutual insurance associations subject to the private insurance code. There were in 1925 over a million persons subscribing to substitute funds (*Ersatzkassen*) for compulsory insurance.

The experience of Switzerland, the most democratic of European states, is of exceptional interest. Following the initiative of several of the cantons the federal legislature in 1899 enacted a compulsory sickness insurance law, which was, however, rejected on submission to referendum. After acute controversy the Sickness and Accident Insurance Act of 1911 was passed and after confirmation by referendum it came into force in 1912. It provided for compulsory accident insurance and while encouraging voluntary insurance against sickness by the promise of subsidies empowered the cantons to make such insurance obligatory, either generally or for certain classes of the population, and to establish public funds or to delegate these powers to the communes, employers to be exempted from contributions. Both methods have been employed, with the result that compulsory and voluntary systems exist side by side; in addition obligatory sickness insurance for school children has been introduced in five cantons. One of the anomalies of the situation is that the public funds and open private funds, which in 1925 covered almost three fourths of the insured population, paid average benefits of twenty-two and twenty-eight francs respectively, while the cost of benefits in the works funds insuring one eighth of the total averaged fifty-eight francs. In Holland a compulsory sickness insurance measure enacted in 1913 was soon discarded as unworkable, and the government fell back upon the voluntary system; but since 1909 employers have been legally bound to pay wages during short illnesses, and since the World War the trade unions have been able to enforce this provision through collective agreements.

The most common types of mutual aid societies today are open funds, either publicly or privately administered by general societies, or organized on a geographic basis, whose member-

ship may be independent of occupation or economic status or by societies composed mainly of wage earners, small independent handicraftsmen, shopkeepers and the like; and closed funds: trade union funds, guild funds or funds formed for separate trades and crafts, separate industry funds—railways, mines, merchant marine—establishment or works funds, societies with political interests and confessional or “nationality” societies. In general wage earners form a large majority of the members: in Denmark over 80 percent, in Sweden 65 percent and in Switzerland 60 percent. Inevitably both the trade unions and the employers hoping to capitalize the good will generated by such funds have sponsored schemes of their own, as have political and sectarian groups. In Belgium following a period of competition between trade unions and mutual aid societies the two groups joined forces to form the Union Nationale des Mutualités Socialistes, which is now an integral part of the *Parti ouvrier belge*, although under the law the political and social funds must be kept separate. In 1926 the federation had a membership of 437,400, the Christian unions 279,000 and non-party groups 130,000. It is the united opposition of these organized groups moreover which has prevented the adoption of national sickness insurance, despite the fact that in Germany and England compulsory insurance strengthened rather than weakened existing institutions. In general mutual aid and trade union activities are today independent. When the right to combine for economic ends was jealously restricted and organizations formed for those ends were subject to close and suspicious supervision, the mutual aid societies were compelled in their own interest to avoid any appearance of invading the special province of the labor unions, although infractions of this rule were common. This attitude of detachment continued to be necessary after the introduction of statutory registration and approval, particularly when official recognition carried with it a claim to assistance from public funds. Only in a few countries are many societies formed on sectarian lines, usually by Roman Catholics or Jews. This segregation is found particularly in Germany and Belgium, where the ecclesiastical cleavage in the population is very marked and politically significant; but confessional societies also exist in Spain and in Switzerland. There is a tendency toward organization by nationality among the Spanish, Italian, German and French population of South America. The survey made for the International

Labor Office in 1927 concluded that open unions organized on a territorial basis showed the greatest vitality.

Even in countries having mutual insurance legislation the societies draw up their own rules, which usually impose conditions as to risks on the basis of sex, age and state of health at the time of application for membership. Inasmuch as conditions of health involving the greatest risk are those for which help is most urgent, the law makes admission as easy as possible in Belgium, Switzerland and Sweden, while in Denmark persons suffering from incurable disease are admitted into special state assisted funds. In Spain a moral or conduct test for membership is imposed. The lower age limits of admission usually range from sixteen to eighteen, the upper from forty to forty-five. As a general rule far more men than women are insured; in Sweden twice as many; in Denmark, however, the number of women members is higher than that of men.

Recognized societies may offer a wide choice of benefits: assistance to members and their families in the event of sickness or prolonged infirmity; old age pensions; individual or collective life, death and accident insurances; assistance to the relatives of deceased members. The “free” societies engage as a rule only in sickness and old age insurance. In France and Denmark special emphasis is laid on family benefits. Sickness benefit may be given in cash or in kind and the latter may include medical attendance, medicine, nursing, hospital treatment, surgical appliances, dental treatment and convalescent care. Judging by expenditure, benefits in cash appear to predominate in Sweden and benefits in kind in Denmark, but in most countries the expenditure is about equally divided. In Holland the efficiently organized medical benefit societies predominate. The duration of sickness benefit varies greatly; in three countries it is prescribed by law—in Sweden 90 days in a year, in Switzerland 180 days and in Denmark 60 weeks in three consecutive years. The right of free choice of doctor is common but not universal. In some countries the heavier and less calculable risks of insurance against invalidity and tuberculosis are not undertaken directly by individual societies but are passed on to federations or special bodies; these may also continue sickness benefit to members whose claims upon their societies have been exhausted. This is the case particularly in Belgium and Sweden. Invalidity benefit is often linked up

with old age pensions and retiring annuity schemes. In a few countries such voluntary schemes existed for miners, numbers of factory workers, government employees and others long before the introduction of compulsory insurance.

Although the principal source of revenue consists of the contributions of the active members, particularly in Belgium, Switzerland and Sweden, many employers and disinterested persons assist as honorary members. Public subsidies are also given in Belgium, Denmark, Sweden and Switzerland. State assistance usually takes the form of a capitation grant or a proportion of the expenditure on benefits; occasionally the two methods are combined. Many local authorities likewise assist by grants of money, by providing meeting rooms or in other ways. In Belgium state aid is also given to the federations and special funds which provide invalidity or sickness benefit to members of mutual societies whose claims have run out. But it is a weakness of the voluntary societies, due in part to the lack of adequate state regulation, that hitherto their tables of contributions and benefits have at times been fixed without regard to true actuarial principles. Increasing attention is being paid to this matter, however, and the tendency is to require proof of financial soundness as a condition of approval or registration. It is probable that the federation movement, which is making steady progress among the mutual aid societies of Denmark, Belgium, Switzerland and Sweden, will help to strengthen the smaller and financially weaker societies.

The activities of voluntary sickness insurance societies in the British Empire and in the United States are dealt with in separate articles (*see FRIENDLY SOCIETIES; FRATERNAL ORDERS*). In South America the voluntary system, dating from the middle of the nineteenth century, is in operation in Argentina and Uruguay and compulsory insurance has been introduced in Chile. In the first two of these countries, where there is a large immigrant population, both native and alien workers usually organize in separate societies, consisting in Argentina mostly of Spaniards, Italians and French and in Uruguay of Spaniards, Italians and Germans. In Uruguay state recognition is voluntary and confers legal personality. Sickness benefit usually consists of cash payments in Argentina, but in Uruguay benefit in kind represents 90 percent of all expenditure. State subsidies are not granted in either country.

Available evidence indicates that while the

voluntary mutual aid societies are in general holding their own in most European countries they are not keeping pace with the growth of population and the rapid industrialization of communities hitherto mainly agricultural. According to recent estimates the proportion of the population insured against sickness in countries dependent on voluntary funds varies from 57 percent in Denmark (where in the towns 90 percent of the workers are said to be so insured) to 14 percent in Belgium, 12 percent in Sweden and only 2 percent in Italy and Spain. Even in France, which before 1930 had a highly developed voluntary system enjoying much public and private assistance in various forms, it was estimated that 7 percent of the total population, or not more than 15 percent of the actual wage earners, were insured against sickness. It is a common complaint in most countries that there are too many small and often inefficient societies in the towns and too few societies in the rural districts. Moreover the bulk of the uninsured consists of workers who because of the low wage level most need provision of this kind.

Despite all deficiencies, however, the voluntary system of sickness insurance is of great value. It provides for large sections of the working class an escape from privation, suffering and the humiliation of dependence upon poor relief in times of stress; and, particularly in Switzerland, it is claimed to have had a distinctly favorable influence on the health of the insured classes. Nevertheless, it is increasingly expected that in many countries the voluntary principle will not long withstand the desire for a system of popular insurance which will meet satisfactorily the conditions and needs of modern industrial life. Hitherto where state action has been discouraged it has been largely because of a dislike of irksome bureaucratic regimentation and the belief that although efficient state action would prove costly. In general, however, when the old idea of the police state gives place to that of the social state there is a tendency among the wage earning classes to look with growing confidence to governmental action for the amelioration of economic conditions, and there are many signs that the antigovernmental attitude is changing. It is significant that the International Conference of Unions of Mutual Benefit Societies and Sickness Insurance Funds held at Brussels in 1927 formally approved the principle of legal compulsion with the proviso that the management "should be entrusted, under

the supervision of the public authorities, to self-governing institutions administered in the exclusive interest of insured persons and the nation at large." The principle has since been seriously advocated in Belgium, Italy and Sweden. If compulsion should ensue, however, it does not follow that voluntarism would disappear; probably, as in Great Britain and Switzerland, the two systems would continue to exist, with compulsion supplementing rather than replacing voluntary self-help.

MYSTERIES are ceremonies open normally only to members of a particular social unit or to approved persons within or outside of the social unit; such ceremonies involve secrets which those present are bound not to divulge and which are conceived to be intimately related to the preservation of life and of the means of living. Sometimes they confer upon the recipi-

ents an indelible character and a peculiar status. There are two main types of mysteries: initiatory ceremonies which admit an individual to adult life in the social unit or confer membership in an age group or in a secret society and which are often thought to involve a mystic rebirth; and dramatic reenactments of myths at stated seasons, sacred performances held to be of the same reality and quality in each performance as in the supposed archetype. Both classes of mysteries commonly involve seclusion and a heightened seriousness; together they form the background of the concept of sacrament.

Communal initiatory ceremonies at puberty, although very widespread, are absent from the cultures of Greece, Italy, Egypt, Mesopotamia and of Aryan India; the ceremonies which mark puberty in these areas can be explained in their cultural context without the assumption that they are survivals (*see* INITIATION). On the other hand, dramatic rites are as common in these as in other cultures; their character depends upon the means used to sustain life and upon the prevalent views of gods and of natural processes. In early Mesopotamia the disappearance of vegetation in the heat of summer was expressed in the myth and cult drama of the death and reanimation of Tammuz, and the defeat of the sun by winter and its return were probably symbolized by the new year ceremony of the imprisoning of Marduk in the underworld and his liberation, celebrated in early spring. The death and life of vegetation in Syria were represented by the commemoration of the death and rising of Adonis in the summer and by the annual awaking of Melgart at Tyre in February, as also in Phrygia by the dramatic rites of Attis. In Egypt the death, dismemberment and reanimation of Osiris were celebrated not merely in an annual drama but also in other festivals: a text is extant of a ceremony probably performed daily in which each hour had its role. The ceremony was not the raising of Osiris to renewed earthly life, although his dead body was thought to have been enabled to beget Horus; it was a funerary ritual which secured his installation as king of the dead, capable of enjoying a full existence in the other world but replaced on earth by his son. He is the typical dead king and, with the democratization of belief, the typical dead man. The nature of the dramatic ritual is illustrated in a document of not later than the fifth dynasty in which the story, including the dialogue, is combined with stage directions and with notes on offerings; dramatic

action appears to have been interspersed with recitative as in a mediaeval mystery play. The idea of the new life of barley rising from the earth was early associated with Osiris and the dates of his festivals point to a connection with the fruits of the earth. The security of the dead, however, is the original and remains the central concept, as was appropriate in Egypt where men lived in mud houses but built eternal habitations for their remains. New life comes to the dead and from the idealized dead: the grain of corn rises from Osiris; it is not Osiris who rises like the grain of corn. All could attend the public performance of the drama, but participation in it was reserved for priests and dignitaries. It was not thought that those who attended were guaranteed immortal happiness; instead they were obliged to depend on the performance of the proper funerary rites after death, as Osiris did.

No such dramas are to be found in ancient Persia, where natural processes were normal incidents in a history believed to have a divine beginning and a divine end; it remains questionable how much of Mithraism existed here, in its place of origin. Among the Greeks natural processes were for the most part regarded as controlled by divinities rather than as the expression of divinities; yet Greece had numerous secret ceremonies, such as the Thesmophoria at Athens, which was restricted to women and was intended to promote the earth's fertility. The most famous mysteries of Greece were celebrated at Eleusis. They consisted largely of the performance of a drama portraying the carrying off of Kore (or Persephone) and her restoration to her mother and of a showing of secret objects; attendance at these performances after due purification constituted initiation and conferred the privilege of admittance to the higher grade of vision (*epopteia*). The participants looked forward to a bright future in the after life; they were probably thought to have become children of Demeter. These mysteries, originally local, came to be open to all Athenians who wished to use them and later to foreigners. Aristotle probably referred to them when he said that those being initiated did not have to learn anything, but to go through an experience and to be in a state of mind. All that is known of the rites of Samothrace is that those who had received them were thought to have become holy and to enjoy protection from perils at sea.

The cult of Dionysus, which spread rapidly from Thrace through Greece, generated not only public dramatic ceremonies but also initia-

tions administered by private societies and the ecstatic rending and eating of animals, which were sometimes thought to be incarnations of the god. Similar rites not confined to local shrines were associated with the cult of another Thracian god, Sabazius, and with Orphism, a personal religion with a dogma and a sacred literature. Here the word initiation, however, was often used to denote a rite of purification capable of being received repeatedly or, when on behalf of the dead, vicariously. In these circles worship became detached from any civic or local basis and became an affair of the individual, who used it according to his own interests and wants and often joined in groups with others of like mind. Such groups gained in importance as a result of the conquests of Alexander, which removed many from their old homes and pieties and left them in need of new affiliations and of gods who were not tied to local shrines but were able to protect them in the larger world. Certain deities, such as the Greco-Egyptian Serapis, the Egyptian Isis and Osiris, Adonis, Attis and later Mithras, were detached from their local settings and were made the central figures of cults which took shape in the now mixed populations of the Hellenized East and were carried westward by commercial settlers, by slaves, by returning merchants and by soldiers. These worships retained the original public dramatic commemorations; often they became civic cults, and frequently there were acquired initiatory ceremonies for those whose devotion, curiosity and wealth were adequate. The new rites were thought to guarantee a happy hereafter by a ritual simulation of a rebirth or reconstitution of the self or by an anticipation of the soul's journey after death; they were not, however, held to be an indispensable condition for bliss and were used only by a fraction of those who frequented the temples. Mithraism formed an exception in that it never became a civic cult, had no cult drama and no public ceremonies, was with one dubious exception confined to men, had a cosmological interest, had no circle of devotees larger than the circle of its initiates and provided in its communion rite a focus of continued religious life. But Mithraism is no exception to the rule that these worships did not demand of their votaries any renunciation of earlier religious loyalties and were practised in addition to civic worships of the old type; they were susceptible of theologies based on Greek philosophical thought but had no fixed dogma; and they did not develop oecumenical hierarchic organization. It is therefore

erroneous to speak of Mithraism as a system and as a church which might have triumphed as a rival of Christianity.

When the Christian movement passed from being a sect within Judaism, it too became one of the claimants for this individual religious interest and could be described by Lucian as a new *telete*, or rite, introduced by the Palestinian who was crucified. It ranked as godless because of its refusal to participate in the ordinary observances, and yet to Celsus it appeared to fall into a class with the worship of Mithras and Sabazius; he regarded it in fact as inferior to them because of its incivism and of its appeal to sinners rather than to the pure. Christians, likewise impressed by the sacramental similarities, by the baptisms and communions in other cults, explained them as diabolical anticipations.

Authorities have differed as to whether these similarities were fortuitous, whether Christian sacramentalism with its objective view of baptism and the Eucharist was conscious borrowing or whether it was to be regarded as a result of the incoming of converts who brought their old ways of thought with them. In spite of superficial Hellenism the background of St. Paul is predominantly Jewish and he shows little understanding of paganism except as viewed by Jewish apologetics. There are moreover fundamental differences in pagan and Christian sacraments. Pagan sacraments turn on the liberating or creating of an immortal element in the individual with a view to the hereafter but with no effective change of the moral self for the purposes of living. Christian sacraments, in their earliest phase, turned entirely on corporate participation in the new order, for which all were alike unfitted by nature. To become fit men needed baptism, regarded at first perhaps as a purification but soon and possibly from the start as something more—a symbol of dying like Jesus as a preliminary to sharing His glory. The baptized then joined in a communal life having as its center the sacred meal, in which Jewish table prayers were combined with the solemn record of the symbolic act of Jesus at the Last Supper and with the solemn anticipation of the expected second coming and the messianic banquet then to be enjoyed. These sacraments referred to the past and to the future; their Hellenistic rivals were set in a static world order which looked to no goal and offered a reward which should accrue to individuals usually in the after life.

In the next phase of Christian development this antithesis grew weaker. The hopes of an

immediate second coming waned and the church became in fact if not in theory an organization intended to enable individuals to enjoy a moral life now and a happy hereafter rather than a prefiguring of the kingdom of God. Baptism was no longer regarded as a "new creation," the substitution of a new man for the old, but as a rebirth. The Eucharist became the central cult act of this corporate institution for individual betterment and the way in which each member could obtain a foretaste of immortal life; it came also to be regarded as the actualization of the redeeming death of Christ.

It is not clear that there was deliberate borrowing. The strata from which converts still came did not contain many who could have afforded initiations, although it would include many who would know that there were such practises and who had perhaps desired them at a price within their reach. Mystery sacramentalism moreover, apart from the Orphic and Eleusinian rites, was never presented as indispensable. Terminology borrowed from the mysteries was increasingly applied to the Christian sacraments, but much of it was already commonplace in a metaphorical sense. In the fourth century, when Christianity became official, ceremonial secrecy about the creed and the Eucharist toward those who had not yet been admitted to the sacraments was introduced; this was a pagan custom, now necessary in order to preserve a suitable atmosphere not required when adhesion to the church demanded serious purpose and courage. It is difficult, however, to see any indebtedness to pagan sources in the elaboration of eucharistic ceremonies which took place at this time.

Dramatic presentation of sacred story survived in the mystery plays of the Middle Ages and is seen in the elaboration of the rites of Holy Week.

MYSTICISM is the religious and metaphysical experience of endowing with immediate presence and intimate reality the realm of the invisible and inconceivable. The religious mind believes in objects which must remain for him invisible while here on earth; in mystical experience he seeks to bridge the gap which separates him from them. Belief thus becomes intuition, otherworldly existence becomes earthly presence. In philosophic mysticism there is a similar tendency. Just as the religious mystic strives to abolish the distance which separates him from the objects of his belief, so the philosophic mystic attempts to make real through immediate intuition what is given to him only in thought. The philosopher does not actually live in the world which he tries intellectually to conceive; although he may conclude that the sense world does not exist, actually he affirms its reality through his acts and deeds. It is thus possible for him not to intuit the realm of his thought, presented to him as it is only in words and in successive conceptual forms. He sets out then to perceive intuitively what he at first grasps only discursively and abstractly, with the aim ultimately of eliminating the distinction between himself and the object of his intuition.

Mysticism in the proper sense of the term is the combination of the religio-mystical and the philosophico-mystical types of experience. In the development of mystical experience in its purest form philosophic thought plays an important role by showing the mystic the way to the elimination of everything that is received through the senses—the pluralism of the traditional belief objects which confront the intuition

of the mystic becomes in this way more and more restricted until finally, when all sense phenomena are removed, God alone remains as the object of quest. Only seldom, it is true, are the sensual elements fully eliminated (as was more or less the case with Meister Eckhart and St. John of the Cross); generally there remains, at least in the background, a mass of visions and hallucinations (as in the case of St. Theresa).

If philosophic thought tends to bring about the spiritualization of mystical experience, religious motives also are decisive in the building up of that experience. The absolute, as conceived by philosophers, is for the religious individual an object of love as well. The road to the Godhead which the philosopher maps out is for the believer an ascent to the God of his love. Indeed love and knowledge are so closely connected that sometimes the latter, as in the case of Meister Eckhart, sometimes the former, as in that of Tauler, Suso and Ruysbroek, signifies the highest and ultimate state.

Another factor which is important in mystical experience is the quest for salvation. The road which leads to the perception of the absolute and identification with the One marks also for the mystic the liberation from all the needs of existence. The ascent of knowledge is at the same time a process of soul healing. Mysticism becomes psychotherapy. This connection between psychotherapy and the striving for knowledge is basic to Hindu-Buddhist mysticism. Since salvation through philosophic knowledge is the fundamental motive, Indian philosophic thought is thoroughly imbued with a tendency toward the immediate realization of mental data and the conversion of the results of thought into corresponding spiritual states, which serve as the stages of a progressive salvation. Mysticism is thus the logical outcome of all Indian thought and feeling.

Quite different is the position of mysticism in Jewish, Christian and Moslem cultures, for here mystical tendencies conflict with other spiritual orientations. Scientifically grounded philosophy and the religion of faith oppose, each in its own way, their respective authorities to the force of mystical tendencies. In Greek philosophy the intrinsic value of objective thought had been definitely established. Although a yearning for the sight of the ideas was a dominant motive behind Plato's philosophy, dialectical thought still remained for man the necessary and unalterable starting point. In the objectification of this thought moreover lay the

value of philosophy and not, as with the Hindus, in a subjective realization of the products of thought or in the construction of a spiritual state corresponding to the thought. It is this concern for objectivity which constitutes the scientific spirit of the West. Only with the break up of ancient civilization was this spirit transformed into the attainment, through knowledge and subjective spiritualization, of a state of rapport with the One and the Ultimate. With Philo of Alexandria and Plotinus the personal need of salvation became the dominating preoccupation—philosophy was synonymous with mysticism. Thus there was constituted through the intermediary of Dionysius the Areopagite a current which determined the development of mysticism in the Jewish-Christian-Moslem culture.

Mysticism nevertheless was here always in conflict with the philosophico-scientific spirit and its striving for objectivity as well as with religion. The faith religion of the West was a strong bulwark against the penetration of any tendencies to pure mysticism. It is the lot of man here on earth, this religion taught, to believe in God without being able yet to perceive Him. Faith religion effected a sharp separation between this world and the next and in contrast to mysticism emphasized precisely the distance which separates the earthly and sinful man from God; it rejected any anticipation of the hoped for otherworldly state, such as the mystic claimed.

This clash between mysticism and faith religion is most clearly brought out in the contrast between an impersonally constituted Godhead and a personal God. Basically there is here involved one of the contradictions immanent in the mystical experience itself and arising from its attempt to combine philosophy and religion. The Jewish, Christian and Moslem religions agree in conceiving of God as a personal and active being. If then through the influence of philosophic thought the concept of God is turned into that of substance and, even further, into that of a formless One, the God of religion becomes depersonalized. At the same time even man himself is turned in mystical experience into something impersonal, so that the personal relationship between man and God, particularly as expressed in the experience of prayer, is entirely removed and the unity of a personality-less man and the Godhead takes its place. This depersonalization, so consonant with the Hindu-Buddhist spiritual temper, meets with continuous resistance on the part of the Jewish, Chris-

tian and Moslem revealed religions, which are based on tradition and which oppose to the conception of mystical unity the living relationship between God and man.

These conflicts became specifically defined in the development of western mysticism. The representatives of the faith religions accused the mystics of presuming to have attained on earth a perfection granted only to the elect in the other world and further of being completely lacking in the sense of guilt and sin which makes corporeal man radically unworthy to see God. Above all, however, the representatives of faith religion clashed with the mystics on the ground that their God, instead of being an active personal agent who intervenes in history and in individual life, was a colorless entity completely outside of history. Since the mystic rejects in all individuals everything temporal and concrete, he ends up by rejecting all that the religious traditions narrate about God and His relations to man. Thus there remains only an unchangeable, timeless Godhead. The Christian faith religion could not agree with such a conception of God, as it was specially concerned with emphasizing the religious value of the appearance of Christ, the man who became God, as against a superman Godhead. These Christocentric tendencies penetrated even into Christian mysticism, particularly in the doctrine of Bernard de Clairvaux. Side by side with speculative mysticism there thus developed a specifically religious mysticism centered in Christ, which in many ways modified the philosophic moment in mystical experience without altogether overcoming the gulf between the neo-Platonic motif of contemplative infinity and the Biblical motif of a living and visible Messiah.

In the vision of Christ, however, faith religion, particularly as conceived by Luther, found a counterbalance against mysticism in general. Mystic divinity became in Luther's teaching the doctrine of a God concealed from man and unapproachable. Man should cling to the God revealed for the human species in Christ and should keep from attempting to overcome the divinely ordained earthly limitations and from seeking his salvation not in repentance but in mystical exercises. Nevertheless, Luther could not prevent the late mediaeval mysticism from developing under Protestantism and even from thriving under the very influence of Protestant religious individualism.

The opposition between mysticism and faith religion marks an important stage in western

Christian development. It is to be noted, however, that two motives are involved, both playing an essential role in this development and representing two sides of the same process. The believing Christian always yearns for the sight of what in the next world is to be crystallized for him into a living present, and out of this yearning there arises in his soul, as an anticipation of the hoped for state, the experience of mysticism. At the same time he is made conscious of the fact that so long as he remains on earth he cannot attain the vision of his yearning; thus the distance between God and man is reestablished, and the believer perceives the insufficiency of all earthly existence. Without the mystical tendency, which leads man out of himself, faith would lose its force; on the other hand, if the mystical tendencies were allowed complete sway, faith might be reduced to an intuition bare of all concrete content.

This struggle between mysticism and faith religion plays an important part in the history of western mankind. There are epochs which may be designated as the mystical epochs of mankind; such are the close of antiquity and the close of the Middle Ages. Characteristic of these periods is the striving for depersonalization, for which mysticism offers the final expression. This striving marks the break up of a historically developed personality; it signalizes the disappearance of the ancient and mediaeval types of manhood. There follow ages of reconstruction, in which a new personality is built up, and the human type of a new age appears. Creative religious geniuses, like Augustine and Luther, who in their own lifetime overcame the tendency to mystic impersonalism, play then a decisive role.

The mystical epochs witness the disintegration of the existing social order. Apocalyptic and prophetic tendencies frequently are mingled with mystical yearning. The layman who has attained to mystical intuition feels himself superior to the priest who remains in the traditional forms of faith. Women, especially nuns, assume an important role. The distinction between educated and uneducated breaks down, for it is precisely the "simple" folk who most often attain an immediate vision of God, while the learned theologians remain imprisoned in the traditional forms of thought and in the scholastic conceptual constructions. This explains also the influence which mysticism has exercised in the lower strata of society, especially at the end of the Middle Ages and during the period of the Reformation.

Mysticism therefore inevitably clashes with the fundamental dogmas of the church hierarchy, and as a result of this conflict new religious communities spring up. The "Friends of God," on the basis of their immediate relationship to God, organize a "community of the holy," over whom "the pope has no power" (Tauler). Of such communities the most extreme were the "Brethren of the Free Spirit," who taught that anyone who attains perfection by divine inspiration lives free of all human and ecclesiastical dogmas.

Mystics tend to deduce from their immediate relationship to God rights which the church cannot accede to them. The piety of the believer who stays within the ordinary religious concepts seems to them a lower state of religious experience. Thus mysticism aims at a sort of super-Christianity, while the clerical authorities keep guard against the development of any such esoteric religion as might destroy the unity of experience on the part of the religious community. Bossuet rejects the *voies extraordinaires* of a Madame Guyon and a Fénelon, opposing to them the *voie commune*, a piety accessible to all Christians and befitting the human state.

The mystic may thus be feared by religious organizations for his habit of keeping aloof and following his own way. He experiences God in his own personality and relies on his individual experience without caring for tradition and social sanctions. As a monk he may separate himself from the other members of the cloister community and lead a solitary life; or groups of mystics may wander over the land as mendicant monks. Finally, they may choose the way of hermits who seek solitude or, remaining within their surroundings, lead the lives of misunderstood eccentrics. In its various forms mystical individualism played an important role in the development of the bourgeoisie at the close of the Middle Ages and contributed greatly to man's emancipation from traditions and ecclesiastical ties.

Mysticism has also a positive sociological significance. Although it does not lead to the development of strong organization, it is none the less favorable to the development of free groups. Between such groups, particularly between men and women mystics, relations of friendship are formed. There is established correspondence, exchange of experiences. Meeting places are arranged which are open to all those who seek communion with God. Thus there develop alongside the strong ecclesiastical organizations

looser communities which depend only on spiritual sympathy. These more fluid communal forms not only exercised an influence over the Protestant sects in the period following the end of the Middle Ages but foreshadowed the possibility of a society without ecclesiastical and political bonds.

All these tendencies are expressed in the concept of an invisible church embracing all who subscribe to the same mystical ideal; such persons would form a spiritual brotherhood. Nor would differences of class, of national allegiance and even of religion constitute barriers, for the traditional untrammelled, immediate relationship to God would be the unifying bond. Mysticism thus becomes a sort of superreligion, in which the mystics may well tolerate all other religions as mere preliminary stages; this was the case among the Sufist mystics in Persia and in the West among the heretical mystics, the Brethren of the Free Spirit. These mystical strivings for toleration attained great importance during the religious struggles of the sixteenth century, when the "spiritual libertines" made no distinction between Catholic and Protestant church services, and reached still fuller development when the Protestant church broke up into numerous sects. The mystical attitude of being above churches and above parties, of being at the same time individual and universal for mankind, becomes increasingly characteristic of Protestant mystics.

Mysticism brings together various tendencies which may reappear independently on the stage of history and which may each exert a separate influence. Thus the mystic strives toward a definite spiritual state and for its attainment utilizes various psychotechnical methods; these methods may, however, as with the yogis and the later Buddhists, acquire a special importance and as pure psychotherapy may play a significant role in individual and social life. On the other hand, mysticism leads to an emphasis upon and a methodical observation of internal psychological states. St. Theresa is the typical representative of this psycho-autobiographical tendency, which may sometimes overshadow the other phases of the mystical experience and may even lead the student of mysticism to neglect the historical and social features. To be sure, for the mystic himself the psycho-autobiographical methods often break down when it is a question of describing that state of mystical blessedness which cannot be expressed in words. Here recourse may be had to the poet, who alone can express

what surpasses all thought. Mysticism now turns into lyricism; as representative of this tendency mention may be made of St. John of the Cross, who illustrates the effect of mystical influences upon the development of lyrical poetry.

Finally, mystical experience may lead to a state of general religiosity dependent on the emotions and unlimited by dogma. Such after-effects of mysticism are characteristic of Rousseau and the romantics. It is the possibility of a religiosity determined by a pure state of feeling without any strong dogmatic structure that attracts the modern person to mysticism, which offers him the opportunity for religious experiences that he cannot find in the traditional religions. Moreover in times of great crisis there is frequently a break up of personality as a result of revolutionary changes in social life and the spread of skepticism of rational arrangements. Both of these factors may lead man to resort to the unconscious and the irrational.

MYTH. Myths like folk tales are primarily novelistic tales; the two are to be distinguished only by the fact that myths are tales of the super-

natural world and share also therefore the characteristics of the religious complex. For the purposes of study mythology can never be divorced from folklore. Its stories of the supernatural, its types of plot and even its specific incidents are those of current folk tales. In regions where *Odyssey* forms are favored the secular heroes and the gods alike wander in search of adventure. In countries where comic and picaresque characters hold an important place in folklore such characters easily become supernatural tricksters through whose agency the world attained its present form. A story passes in and out of the religious complex with ease, and plots which are told as secular tales over two continents become locally the myths which explain the creation of the people and the origin of customs and may be dramatized in religious ritual. Most myths have these secular analogues in the same tribe or in other tribes. For example, the story of the monster who swallows the hero and from whose belly he escapes unharmed has a world distribution; among the Hebrews it became the story of the prophet Jonah escaping from the command of Jehovah, and later among some Christian groups belief in it became a touchstone of religious faith in spite of the fact that the story is historically unintelligible without its extrareligious variants.

Curiously in western civilization religion has come to be defined in terms of these myths. The Christian cosmology has been selected as the substance of religion, so that a person who has found religion is understood to have embraced a certain mythology and one who has lost religion to have ceased to believe in it. This identification of religion with its myths contrasts strongly with the usual behavioristic category of other peoples, according to which a person is religious in so far as he acquires power by religious techniques. The question of belief and disbelief is not properly a religious one; all traditional elements of culture are with equal propriety the objects of skepticism. Examples of such skepticism are found in certain cases even among primitive peoples, where they are directed toward the authority of the old men in secular affairs or the rulings of exogamy quite as often as toward the supernatural. It is the characteristic of the present century to have made skepticism a special religious category and to have defined religion by means of it. This has elevated myth in the Christian tradition to a place probably unequaled in any other religion and has led students of comparative religion to discuss religious history as if

it were a history of certain dogmas prominent in the Christian cosmology. This is a crucial distortion. Dogmas are myth; in religions they are accessories after the fact and should be studied along with other rationalizations and superstructures whose function it is to bolster and make more impressive the original trait. Folklore performs this function not only for religion but for a variety of cultural traits. The kingship is in many islands of Polynesia a secular institution over against the religious priesthood, but it is elaborated with traditional genealogies and tales of folklore quite after the fashion of religious cosmology. The potlatching system of the northwest coast of America is similarly buttressed by traditional history and songs. In each case as in religious myth origins are carried back to the beginning of the world and the trait is made fundamental for the continuance of the tribal life.

No other realm of human culture, however, gives to the human imagination the extent of freedom provided by the religious idea that the external world is animate and that man can entreat it and make it propitious. In the field of the supernatural man has access to an "other" world which gives free rein to his mythmaking. Cosmology and supernatural lore have therefore developed richly upon religious soil. Their place in the different cultures of the world is very unequal but they are probably never wholly absent. Africa is peculiarly poor in cosmology; the Negro peoples have the myth of the origin of death and often bare statements of the origin of man, but the elaborate cosmological cycles of Polynesia or North America are not present. Cosmological themes differ fundamentally on different continents. Thus a myth of creation does not exist in North America outside of very limited areas, principally small regions of California. Most Indian mythologies substitute the concept of a mythological age when the animals lived a human life. The origin of the beings of this mythical age is unaccounted for and the event which corresponds to creation in other areas is in these mythologies the transformation of these animals into the ancestors of the tribes. In Polynesia, on the other hand, the philosophical conception of the creation from nothingness is fundamental in cosmology and is abstractly elaborated.

Mythological descriptions of supernatural beings are also exceedingly diverse. Discussion of religion cannot be restricted to mythologies that are characterized by a supreme god, for this

is a folkloristic detail that has occurred among the simplest peoples and at all levels of cultural complexity and it has usually little bearing upon the religion as a whole. Other mythological concepts as to the nature of the gods have much greater significance, as, for instance, whether the supernaturals are conceived as the dead, as local spirits or as individualized members of a supernatural pantheon. The religious mythology of the Indians of North America, in which the supernaturals are not the dead, is thus quite different in character from that of most of Africa or of much of Melanesia; the various forms of ancestor worship are therefore not possible and both religion and social organization take on a different aspect. The supernaturals, on the other hand, are sometimes nature gods; in areas where this is true the mythology develops themes suggested by such identification. No body of myths has become a consistent nature allegory, and many primitive cosmologies use the names of sun and moon without giving to them roles which are in character. Greek mythology is the most nearly consistent nature mythology but even in this instance the nature theme is only partially carried out. The Greeks had gods, like Ares, Hermes and Athena, who were not symbols of natural forces, and although Apollo was identified with the sun he was also the healer and the lover; although Artemis was the moon she was also the protector of wild animals and the virginal warrior. Nevertheless, the strong tendency of the Greeks to stress the character of their pantheon as nature gods and to make use of allegories of the weather and the seasons and of day and night gives distinctive character to Greek mythology. Religions have been denied the name because their mythologies did not include the concept of the after life; yet the theme of after life is sometimes absent from mythologies even in highly developed religions. In primitive mythologies and religions the after life has in some regions fantastic elaborations; in others it receives mention entirely without religious implications, and in still others it is left out of account in favor of a previous life which governs and holds the clue to every happening in this present incarnation. It is important in the religious complex only in so far as different attitudes toward other worlds condition religious practises.

No generalization is possible as to the degree to which myth is dynamic in religion. Conditions which inhibit the growth of mythologies of necessity tend to limit their consequences in the

religious realm. In east Africa, where the recently dead are the supernaturals who are entreated, there is less stimulus to mythmaking and hence less conditioning of the religious complex by mythology than in those regions where the supernaturals are freely imagined personages of a pantheon. The small role of myth in Africa and its much greater importance in religion in parts of North America may be due to this contrast. Myth is among some peoples the keystone of the religious complex, and religious practises are unintelligible except by way of their mythology. Among the Eskimo the Sedna myth determines the form of their chief religious observances and the functions of shamanism, and by its incidents they motivate their confessionals and their hunting tabus. On the other hand, the exacting dairy ritual of the Todas seems unsupported in mythology, and the gods mentioned in the prayers are on the level of mere *abracadabra*.

The subject of the degree to which myth conditions religion is merely one aspect of the problem of the interrelation of cultural traits. In every field it has been amply shown that the relation of distinct traits is not genetic; that is, the origin of religion is not to be sought in mythological concepts nor the origin of myth in religion, but the two have constantly cross fertilized each other and the resulting complex is a product of both primary traits. Where folklore therefore has developed richly in the religious field it is no isolated fact to be studied only as folklore but a phenomenon full of implications for the local development of religion. Thus the fundamental opposition of good and evil is a trait of occidental folklore that is expressed equally in Grimm's fairy tales and in the *Arabian Nights*. Taken up into the cosmologies of the Hebrews, the Mohammedans and the Christians it determines some of the most deeply seated world views of western religions and western civilizations. The opposition of God and the devil, of Christ and Antichrist, of heaven and hell, is part of the fundamental intellectual equipment of those who participate in these civilizations. On the other hand, in regions where the animal trickster is the important character of secular folklore and is taken over as the leading character of mythology the course of religious thought is necessarily different. The trickster is regarded as having brought the world to its present shape and as having instituted the customs and blessed the people of his tribe. He is nevertheless a figure without honor and without dignity even from the point of view of the

ethical standards of the tribe in question, for he is pictured as lascivious or as a gormandizer or a boaster who made this world what it is in the course of pursuing his own pleasures. In areas that possess such mythologies the chief problem of religion is no longer that of reconciling the existing world with the omnipotence of a good god, and injustices that are crucial in the so-called ethical religions do not become a matter of religious speculation at all. What is true of religious thought in such cases is equally true of religious practise, and no complete understanding of either is possible without an understanding of the relevant mythology.

Myth like secular folklore is an articulate vehicle of a people's wishful thinking. Secular heroes portray the ideal man of the culture, and myth remodels the universe to its dominant desire. Mythology has notoriously represented its makers as chosen people or as the first and uniquely created human beings. Hebrew history was recast as Yahweh's dealings with his people and the future was imagined as the triumph attained through his aid. Early Christian myth centered upon the return of Christ and the inauguration of the kingdom of the saints. Sorel discussed such myth thinking in connection with the concept of the general strike and its place in socialist philosophy. In such a myth, he maintains, a group dramatizes all its strongest inclinations, and its dreams acquire reality and its acts sanctions. Sorel used myth in this sense without reference to mythologies as bodies of folklore, but these dominant desires are nowhere more freely expressed than in traditional mythologies. The striking contrasts in different collections of myth are in a large measure due to the difference in the types of wish fulfilment that are characteristic of the different cultures. Even in the most general sense and ignoring local contrasts myth is universally the wishful projection of a universe of will and intention. Man in all his mythologies has expressed his discomfort at a mechanistic universe and his pleasure in substituting a world that is humanly motivated and directed. He has imagined both the topography of his country and the ethical standards of his people as the outcome of human acts of the culture hero. He has recast the universe into human terms.

NANSEN, FRIDTJOF (1861-1930), Norwegian explorer, diplomat and internationalist. Nansen acquired a world wide reputation as the most daring and successful of modern explorers. He was an able diplomat and played an important role in the negotiations leading to the separation of Norway from Sweden, as Norwegian minister at London from 1906 to 1908 and as minister plenipotentiary on special mission to the United States during the World War. In 1920 Nansen became high commissioner of the League of Nations to secure the repatriation of prisoners of war held in Russia and central Europe. With the help of various governments and the International Red Cross Committee of Geneva he secured money, free transportation, food, old army clothing and stores and organized a service of ships, railway transport, camps and hospitals. Within a year almost half a million prisoners of twenty-three nationalities were repatriated. In 1921 Nansen became European high commissioner for private organizations to relieve famine in Russia; the administrative apparatus which he set up expended millions of pounds for relief. His unsuccessful proposal of a League of Nations loan on behalf of Russia became the forerunner of subsequent League reconstruction and refugee loans. In 1922 Nansen established a League of Nations service for the protection of war refugees, which is still operating, investigated the Greek refugee problem and proposed the successful League refugee settlement loan.

The first leader of the small states in the League Assembly in 1920, Nansen helped Lord Cecil secure the admission of Albania against the united opposition of the great powers. His work in the Assembly in defense of the mandates system, often in opposition to the great powers, did much to build up a sense of collective responsibility for the institution of mandates and he took a prominent part in Assembly debates on minority rights questions. In 1923 he led the

small powers in opposing Italian aggression at Corfu. He helped Lord Cecil secure the establishment of the Temporary Committee on Slavery, which led to the drafting of the Slavery and Forced Labor conventions. In 1926 he played a prominent part in reconstituting the League Council after the admission of Germany. His proposal led to the drafting of the General Act for the Pacific Settlement of International Disputes. Nansen's efforts to make of the League Assembly a world parliament rank him with Cecil, Wilson and Briand as a pioneer in establishing a permanent functioning international political organization of sovereign states.

NAOROJI, DADABHAI (1825-1917), Indian nationalist. Naoroji was educated at Elphinstone College, where he became a professor of mathematics. He was active also as a journalist and was one of the founders in 1851 of the newspaper *Rast goftar* ('Truth teller'). From 1874 to 1876 he held office as prime minister of Baroda.

Naoroji was one of the founders of the Indian National Congress and an outstanding representative of Indian liberalism, which advocated educational and other social reforms and fostered moderate constitutional opposition to British autocratic administration. He enjoyed a wide personal influence; a Parsi himself, he was largely responsible for drawing his community into the nationalist movement. Like the educated Indians of his generation he was an ardent admirer of English civilization and in many ways a true Victorian; at the same time English radical philosophy had taught him to respect freedom, and again and again he had to criticize many aspects of British rule in India. As president of the second National Congress at Calcutta in 1886 he stressed his country's loyalty to Great Britain and expressed grateful appreciation for the enlightenment which its rule had brought. Soon, however, he began to proclaim that the English administration was a drain upon India's economic resources and to accuse the former of repeated violation of its pledges of constitutional freedom. Naoroji made frequent visits to England, sometimes remaining for long periods. He

represented Central Finsbury in the House of Commons from 1892 to 1895. His position enabled him to draw attention to various aspects of the Indian problem and he was instrumental in the appointment in 1895 of the famous Welby Commission which undertook an investigation of Indian finances.

He was called from London by the moderates to preside at the historic meeting of the Congress in 1906 and in that capacity to try to stem the rising tide of the younger, more radical generation of Indian nationalists. At this meeting complete dominion self-government was proclaimed for the first time, in Naoroji's presidential speech, as the official aim of the Congress. Naoroji spent the last ten years of his life in retirement. His *Speeches and Writings* were published at Madras in 1909.

NAPOLÉON I (1769-1821), emperor of the French. Napoleon Bonaparte was born of Italian parents in Corsica and was educated in military schools at Brienne and Paris. He supported the revolution, assisted in the capture of Toulon from the English (1793) and in the defense of the Convention against insurrectionists on 13 Vendémiaire (1795). Appointed to command the army in Italy, he made his reputation by defeating the Austrians, organizing northern Italy under French protection and negotiating the treaty of Campo Formio (1797), which gave to France Belgium and the left bank of the Rhine. Returning from the ill fated but spectacular Egyptian expedition, he joined Sieyès and others in effecting the coup d'état of 18 Brumaire (1799), the result of which was to confer upon him power (nominally resting on popular consent and actually approved by plebiscite) scarcely less absolute than that exercised by the Bourbons before 1789. He used his position to "consolidate the French Revolution" in France and to extend the power and institutions of France in Europe.

Napoleon's ascendancy in France was favored by the collapse of revolutionary idealism and the weakness of the Directory, which he supplanted. Peasants wishing to retain their lands free of feudal obligation; army officers whose careers and the new rich whose possessions depended upon maintaining the revolutionary settlement;

politicians, the "regicides" especially, who regarded every question "through the scaffold" on which Louis XVI was executed—all these, having profited or been compromised by the revolution, supported Napoleon as a guaranty against the return of the Bourbons. Ridiculing the "romance of the revolution" (the dream of an ideal republic), Napoleon maintained the essential economic and social changes effected by it. He refused to restore the feudal system of land tenure, the guilds, the *parlements*, the privileges of the nobility and the corporate status of the church. The Concordat of 1801 was a political measure that won from the pope an implicit recognition of the new regime and an explicit renunciation of the ecclesiastical property, much of which had been sold to peasants and middle class people. The *Code civile* (1804) was, with slight exceptions, a systematization of changes effected by the revolution in personal status and property rights—"a summary and a correction of the French Revolution." On the revolutionary settlement as a foundation Napoleon organized, for the canalization of his autocratic power, a centralized administrative system, of which the chief divisions were foreign affairs, interior (through the prefects), finance, justice, religion, education (Imperial University, 1808), army and navy. As Seignobos says, France has remained essentially what Napoleon left it, a democratic society governed by a centralized administration: the revolution created the former, Napoleon the latter.

Napoleon was not content to govern France only. Urged on by daemonic energy, ambition, perhaps the vision of a warless and more efficiently governed Europe, he endeavored to create a "Grand Empire." Vaguely conceived at first, his object became more definite as the crucial military victories (Austerlitz, 1805; Jena and Auerstädt, 1806; Wagram, 1809), by abolishing the old empire and reducing Austria and Prussia to secondary powers, gave him a free hand in Italy and Germany. France was gradually enlarged by annexations of the Kingdom of Sardinia, Tuscany, the Papal States, Holland and north Germany; and new kingdoms, Italy, Naples, Holland (until 1810) and Westphalia, were created and turned over to be governed, under imperial supervision, by Napoleon's stepson Eugène and his brothers Joseph, Louis and Jérôme. Of the Swiss Confederation Napoleon became "mediator"; of the Rhine Confederation (constructed out of the south German states enlarged by the "secularization" of hundreds of

minor imperial principalities) he became "protector." The Polish territories of Prussia and Austria were comprised in the Duchy of Warsaw, governed nominally by the king of Saxony as duke, in fact by the French ambassador at Warsaw and the French commander of the Polish army. Prussia, conquered and partitioned, was occupied by French troops, while Austria, humiliated by many defeats, became a semi-dependent ally of France. Meantime French institutions followed the tricolor. In Italy, the Rhine country, Belgium and Westphalia the French administrative system and the *Code civile* replaced the institutions of the old regime. By 1810 Napoleon's secret was half revealed, the design of his grand empire could be seen emerging from the reconstructed map of Europe. At St. Helena he said his purpose was to establish a United States of Europe; in 1811 he said: "The same law must run throughout Europe. I shall fuse all the nations into one." Upon the reconstructed Europe, whatever form it might take, the empire would confer the benefits of peace, free intercourse, equitable taxes, efficient administration, the *Code civile*, and offer to all men "careers open to talents." The grand empire was never completed. Until 1807 one feels that Napoleon had control of the situation, after 1808 that the situation had control of him. The Spanish conquest was a blunder, the Russian campaign a disaster. Within eighteen months the stupendous structure collapsed and its great architect was exiled, first to Elba and then to St. Helena.

The genius of Napoleon, in its kind, was perhaps never equaled. For fifteen years he bestrode the narrow world like a colossus by virtue of being pure will and intelligence. His special qualities were ceaseless energy; an unfailing memory; precise, always available knowledge of details, united with lucid understanding of general situations; and an egotism never inhibited by doubts as to the value of his objectives or the validity of the means employed to attain them. Outside the realm of the concrete and the practical his mind was naïve, quite incapable of justly appreciating such impalpable forces as love of country or unselfish devotion to any ideal cause. But as an effective and expeditious manipulator of things and of men regarded as things ("Men are like figures, which only acquire value in virtue of their position") he was never surpassed. Inspired gambler that he was, he played to win or lose all, and lost. Perhaps his failure was due to a cardinal defect—the

mistake of supposing that men "only acquire value in virtue of their position."

NAPOLÉON III (1808-73), emperor of the French. Napoleon believed that he was one of those "men of destiny" entrusted by Providence to lead the world. He made two fruitless attempts at a Bonapartist uprising in Strasbourg in 1836 and in Boulogne in 1840. After six years' imprisonment in Ham he escaped in 1846 to London, where he remained until after the Revolution of 1848.

During these early years of struggle and revolutionary activity Napoleon indulged in considerable reflection concerning social and economic questions and problems of foreign policy and published numerous pamphlets and tracts on these subjects. He favored a democratic regime based on the plebiscite; the widest powers, however, were to remain in the hands of the emperor and to be used to increase the well being of the masses. His views on foreign policy were based on the principle of nationality. Disunited nations like Italy and Germany possessed the right to self-development and liberation from Austrian hegemony and it was the duty of France to support them in their struggle.

The Revolution of 1848 resulted in the election of Napoleon to the presidency of the new republic and the coup d'état of December 2, 1851, made it possible for him to restore the empire in 1852. The desire to apply his social and political ideas led him into numerous contradictions. In domestic affairs he pursued a policy of economic reform and enterprise which aimed to spread prosperity in order to make the masses oblivious of their loss of political liberties. He launched a great program of public works, established land banks, constructed railroads throughout the country and, under the direction of the prefect Haussmann, effected the

complete transformation of the city of Paris. Workers were accorded the right of association and permission to form syndicates, but the rigorous surveillance of the police turned them against the empire.

Napoleon's foreign policy was dominated by the Italian question. He aided Cavour in bringing on the war of 1859; he permitted Piedmont to annex central Italy and Garibaldi the south; but he shifted his position on the Roman question since it threatened to embroil him in quarrels with the French Catholics. He came to a rapprochement with Russia after its defeat in the Crimean War, but he strained relations in attempting to intervene on behalf of the Poles. He sought an entente with England and adopted a free trade policy despite the French industrialists, but this plan likewise came to naught because of his adventurous projects. He wished to profit by the American Civil War to create a Latin empire in Mexico, but he was forced by the United States to renounce the plan. He allowed Prussia, which was sympathetic to him, to seize Schleswig-Holstein from Denmark and to form an alliance with Italy against Austria. But Sadowa resulted in the emergence of a strong militarized Prussia, and Napoleon succeeded neither in coming to terms with Bismarck nor in forming a coalition against him, an error which culminated in the debacle of 1870.

NĀRADA (c. 450-550), Hindu jurist under the Gupta empire. Nārada's exposition of private law commanded authority as well as a considerable degree of popularity in mediaeval India. A large part of his doctrines was incorporated, sometimes without acknowledgment, in the works of subsequent writers on both civil and criminal law, while commentators ascribed to him all sorts of important texts bearing on legal institutions. Definitely secular and legalistic in his approach, Nārada emphasized the rule of

reason as a source of law and maintained that where the sacred precept was at variance with custom, the latter should prevail.

Nārada's code of law deals in the introductory chapter with legal procedure, complaints and courts of justice. Then the law is classified under eighteen titles similar to those of Manu, except for minor differences and the fact that Nārada eschews entirely the social and religious items contained in the former's encyclopaedic treatise. Nārada's classification includes debt, deposits, partnership, breach of labor contracts, boundary disputes, marital relations, inheritance and heinous offenses. Like Manu and Yājñavalkya he is liberal and sympathetic in his treatment of the rights of illegitimates, permitting an illegitimate son to inherit his maternal grandfather's property (xiii: 18). But he differs substantially from these authorities in that he holds that even the youngest son, "if able," may govern the family and manage its property (xiii: 5) and allows a father to distribute the property among his sons in whatever proportion he desires (xiii: 4, 15). In his system the widow may inherit part of her husband's property, while unmarried daughters may share in their father's estate (xiii: 3, 12, 13). The right to divorce and remarriage is allowed to women on many grounds (xii: 96-101). Books xii and xiii of the *Nārada-smṛti* are the embodiments of modernism in ancient Hindu conceptions of property and marriage. As the exponent of a secular and realistic view of the law Nārada appears to be as prominent a figure in comparative jurisprudence as is Sukra in comparative politics.

NASSE, ERWIN (1829-90), German economist. Nasse's first achievement was a doctoral dissertation in the field of Roman economic history, *Meletemata de publica cura annonae apud*

Romanos (Bonn 1851). Essays on money and banking, distinguished by an early insight into the function of central state banks, procured him in quick succession in 1856 professorships at Basel and Rostock, whence he was called in 1860 to Bonn, the final place of his activities. There he acted as the classical representative of the Protestant and liberal conservatism of pre-Bismarckian Prussia, in perfect harmony with his liberal Catholic colleague Adolf Held. His *Bemerkungen über das preussische Steuersystem* (Bonn 1861) belongs to the great school of German public finance that culminated in the reforms of the later nineteenth century. But characteristically his love of the Prussian state was coupled with the knowledge of and predilection for England that never left Prussian statesmen from Stein to Gneist. And from a most intimate knowledge of the sources of English economic history sprang the classical work *Über die mittelalterliche Feldgemeinschaft und die Einhegungen des sechszehnten Jahrhunderts in England* (Bonn 1869; tr. by H. A. Ouvry, 2nd ed. London 1872), which revealed to Frederic Seebohm and others the broad bases of the open field system in English and continental agriculture. He thus did for English agrarian history what Held did for the history of the English working classes.

Nasse was the cofounder and for many years the president of the Verein für Sozialpolitik. His interest in social reform, like that of Adolf Wagner, sprang from a deeply religious mind that made him also one of the chief promoters of the Innere Mission of the German Protestant churches and a member of the Free Conservative party of the Prussian Diet from 1869 to 1871. He declined reelection in 1879 only because his economic liberalism brought him into disagreement with Bismarck's protective tariff of that year and he did not want to oppose it politically. To the Verein für Sozialpolitik he contributed besides many a brilliant presidential address the fine paper "Agrarische und landwirtschaftliche Zustände in England" (in Reitzenstein, F., and Nasse, E., *Agrarische Zustände in Frankreich und England*, Verein für Sozialpolitik, Schriften, vol. xxvii, Leipzig 1884, p. 127-222).

NATIONAL BANKS, UNITED STATES.

The national banks, that is, banks operating under a federal charter, represented at the close of the third quarter of 1932 about one third of the total number of banks in the country and possessed approximately three eighths of the loans and investments of all banks. They comprised almost nine tenths of the number and held five eighths of the loans and investments of the members of the Federal Reserve system. Statistics of this type, however, do not alone give an accurate indication of the importance of the national system. In many states laws regulating the organization and operation of state institutions have followed closely the national pattern; and, since they supply the sole compulsory membership of the Federal Reserve system, the national banks may be considered perhaps as the system's strongest bulwark.

As contrasted with developments in other countries the most distinctive feature of the national banking system is its decentralized ownership and control. Provided they comply with certain formalities of a routine character and meet the capital requirements specified in the law, any five or more natural persons may make and file an organization certificate, become a body corporate and with the authorization of the comptroller of the currency begin the business of banking. The amount of capital that must be subscribed varies with the population of the place wherein the bank is to engage in business and may be as low as \$25,000. The Glass-Steagall Act of 1933 raised the amount to \$50,000. It has been supposed that the comptroller has wide discretionary powers in granting authorizations and is permitted to deny applications if in his opinion the community is already sufficiently serviced by existing banking institutions. While the comptroller's attitude may practically be determining in this matter, it is doubtful, however, if he would be within his strict legal power in denying an authorization as long as the requirements of law have been scrupulously observed. By statute and precedent the national banks constitute a free banking system.

If the law had not been hostile to the establishment and acquirement of branches, some such concentration in the ownership and management of banks as in Great Britain, for instance, led to the domination of the Big Five might have developed in the United States. But until 1927

the statutes were interpreted as antagonistic to the creation of new branches of national banks.

This hostility to branch development was modified to a limited extent by the McFadden-Pepper Act of 1927, which permits new branches to be established within the limits of the city, town or village in which the parent national banking association is situated, provided that the operation of such branches is permitted state banks under the terms of state law. The act of 1927 was intended to enable national banks to meet on more equal terms the competition of those state institutions which possess liberal branch powers. Prior, however, to the enactment of the McFadden-Pepper Act some national banks had acquired both intracity and extracity branches by the process of converting a state bank with branches into a national bank and then effecting a merger with the parent national bank. So-called additional offices moreover had been established by some national banks under favorable rulings by the comptroller of the currency.

The theory of decentralization and of local control has also been generally maintained in the regulation of note issues and in the maintenance of reserves. Any national bank can obtain notes from the Department of the Treasury for issue purposes by depositing as security stipulated classes of United States government bonds of equal value (at par or market, whichever is the lower). The government is responsible for the ultimate payment of such notes emitted by the bank. To protect it in this responsibility the government has the security of the bank's bond deposit, the assets of a 5-percent redemption fund maintained in Washington, a first lien upon the bank's assets and the personal liability of the bank's stockholders. Under these provisions national banks had outstanding at the middle of 1932 notes in the volume of \$701,000,000, an amount about equal to one eighth of the total monetary circulation of the country. At the time of the passage of the Federal Reserve Act in 1913 there were more or less general anticipations that in the course of time the national banknotes would be superseded by the new Federal Reserve issues. To permit such substitution certain provisions were written in the Federal Reserve Act. After the reserve banks began to operate, however, there was no considerable reduction in the national currency; and in July, 1932, Congress reaffirmed faith in decentralized note issues by attaching a rider to the Home-Loan Bank Bill increasing

the number of government bond issues which may be employed as security for national bank-notes. Nevertheless, the total issues of any bank continue to be restricted to an amount equal to its capital; and furthermore the provisions of the new statute are operative for a period of three years only.

The principal restriction upon the power of national banks to acquire deposit obligations consists in reserve requirements defined by statute. Until the passage of the Federal Reserve Act there was no legislative attempt to establish special depositories to hold these reserves; here again the theory of decentralization prevailed. It is true that even before 1913 a certain degree of concentration in the holding of bank reserves was accomplished by allowing the national banks in country places to carry part of their required reserves on deposit with national banks in reserve and central reserve cities, and by allowing national banks in reserve cities to redeposit one half of their reserves in banks of central reserve cities (then New York, Chicago and St Louis). Nevertheless, these redeposit provisions represented largely a concession to practices existing at the time of the original statutes, and there was a limit to the extent to which reserves could be maintained outside of the bank's own vault. At present, however, as members of the Federal Reserve system national banks keep in their own vaults only such sums as are required for counter money purposes, and such vault or counter money does not count as a part of the bank's legal reserves. The legal reserves of a national (or state member) bank now consist exclusively of credits on the books of a reserve bank. In this respect the early theory of decentralization has been modified by the development of the Federal Reserve system. A novel feature in the regulation of deposits is presented in the provision for deposit insurance contained in the Glass-Steagall Act of 1933. The act provides for the organization of a Federal Deposit Insurance Corporation with capital subscribed by the Treasury, by Federal Reserve Banks, by the member banks and, with certain qualifications, by non-member banks, which shall guarantee deposits with certain limitations beginning July 1, 1934, or at an earlier date if so ordered by a presidential proclamation.

As compared with the state banking systems national banking legislation has been more restrictive with respect to permissible elements in loan and investment portfolios; national banks have been subjected to rigid limitations in the

making of loans secured by real estate. Such limitations, however, have been considerably relaxed in the Federal Reserve Act of 1913 and again in the McFadden-Pepper Act of 1927.

The origin of the national banking system dates back to the passage of the Sherman Act of February 25, 1863. The main purposes of this statute are suggested by its title: "An Act to provide a National Currency, secured by a pledge of United States stocks, and to provide for the circulation and redemption thereof." There has been much controversy as to whether the lawmakers were principally motivated by the endeavor to improve the market for United States government issues—by requiring that they be the collateral of the notes of the new national associations—or were governed by zeal to provide a better currency than previously had been represented by the issues of many state banks. There is direct evidence, however, that Secretary of the Treasury Chase, who sponsored the measure, had no high anticipations regarding the amount of support to the government's borrowing operations which this act would supply; and therefore the improvement of the country's currency must have been the fundamental motive in his mind. But it is also to be admitted that without the argument of national fiscal emergency it would have been difficult to have gained sufficient support for the measure in Congress. Although the new banking system was in structure essentially different from that of the Second United States Bank, many members of Congress regarded it as too great an interference with the prerogatives of states to be justified on any other ground than extreme fiscal emergency.

Few banks were organized under the terms of the original act and it shortly became apparent that a new measure was necessary. On June 3, 1864, this new measure was forthcoming. But progress in forming national associations continued slow, and it was believed desirable to prohibit the issuance of notes by state institutions. It was accordingly provided in the revenue measure of March 3, 1865, that state bank issues must bear a tax of 10 percent per annum after July 1, 1866. Through the operation of this statute state chartered banks have ceased to issue notes.

There has been much controversy regarding the value to the national banks of the note issue privilege. The smaller national banks in particular have been jealous of this prerogative; but the growth of the check system has lessened the

importance of the issue function, so that the principal advantage of a national charter is perhaps the prestige of membership in the national system. The prestige argument has also lost weight, however, because of the fact that a state bank may apply for membership in the Federal Reserve system and, if admitted, is subject to examination by Federal Reserve authorities. In states wherein the banking law is liberal it has become progressively more difficult to retain membership in the national system.

Much controversy has also been occasioned regarding the desirability of maintaining the national banknote as a prominent element in the country's monetary system. Attacks on this currency usually argue its inelasticity. It is held that an elastic currency cannot be based on government bonds, particularly because an upward movement in the government bond market lessens the profits on note issuance. It is to be understood, however, that it is not essential that every element in a currency system be highly elastic; and that, if Federal Reserve notes or perhaps only Federal Reserve deposits function as they should, any inelasticity of the national currency is not a matter of decisive importance.

Of greater importance is the problem whether the dual system of state and national banks should be maintained. Those who argue for the abolition of the dual system believe that any bank that creates deposit credits subject to check is really providing the public with currency and that therefore it is a mistake to regard the chartering of banks as a local prerogative. They also maintain that the Federal Reserve system cannot flourish as long as the sole compulsory membership consists of banks which may be subjected to competition from state institutions operating perhaps under more liberal charters. On the other hand, those opposed to the abolition of the dual system insist that such a move would constitute an unfortunate step in the direction of increased federal bureaucracy. Some opponents of complete nationalization hold that all banks should be chartered under state authority, with the requirement that every banking institution must belong to the Federal Reserve system.

Another problem is presented by the conflict in regulation and supervision between the comptroller's office and the state banking departments. In many states banking departments have not been able to insist on the observance of certain regulations in conflict with federal law because of the possibility that national banks

might be permitted by the comptroller's office to engage in the practices it is desired to prohibit. It is argued accordingly that it should be made possible for the comptroller's regulations to take greater account of state situations, even though such action might involve some diversity in the operating methods of national banks serving different localities.

Partly for the purpose of enabling banking facilities to be restored to communities wherein extensive closures have occurred, proponents of more liberal branch powers for national banks have increased their demands that branches be permitted over wider areas, regardless of state prohibitions. It is argued that many localities cannot sustain the expense of supporting independent banks and that some form of group or chain banking is inevitable. It is desirable, so it is insisted, for this development to take place under a regulated system of branch banking instead of in some more objectionable manner. Opponents of this proposal sometimes hold that such a measure might induce state legislatures to modify antibranch laws and thus lead to a race between state and national institutions to secure branches. In this way the former tendency to provide the country with an excessive number of banking establishments might be repeated. The movement for more liberal branch banking legislation found recognition in the Glass-Steagall Act, which authorizes national banks to operate branches within the limits of the state in which state branch banking is permitted.

The superior solvency record of the national banks in recent years has often been supported by figures which show that after 1921 the number of national bank suspensions was only about one fifth as great as the number of state bank suspensions. Allowance must be made, however, for the fact that there have been more state banks than national banks, and that state banks may possibly have served in more of the difficult situations. There has been moreover a great variation in the solvency record of state banks among the various jurisdictions.

Most banking authorities are agreed that steps should be undertaken to provide the country with a more uniform banking system. These authorities have not reached agreement, however, on the question whether this uniformity should be attempted by enlarging the scope of the national or the Federal Reserve banking system.

NATIONAL DEBT. *See* PUBLIC DEBT.

NATIONAL DEFENSE. There are few ideas so powerful in human affairs as those connected with the phrase national defense. These ideas dominate the foreign relations of almost every nation; they determine in great measure the present nature of the international society of states; they even dictate in matters of vital national importance the policy which governments pursue in home affairs. They are almost the only ideas which can suddenly arouse a great wave of national feeling, which can unite a whole people in common endeavor and common sacrifice of the most unlimited kind. They are the ideas to which men most readily subordinate not only their national interests and their natural feelings and affections, but for which they most willingly give up their lives. They are the only ideas which have yet led whole nations to impose upon every male citizen prolonged compulsory periods of personal training and personal service for the state. They cause nations to bear a burden of taxation which, for the vast majority of their citizens, involves a real diminution of their standard of living, reducing their consumption even of what is barely necessary for health and strength. If the social energy which they engender could be harnessed to the constructive betterment of human conditions, there would be scarcely any limit to the material and spiritual progress which mankind could make within the lifetime perhaps of a single generation.

Yet, despite its importance, there are few expressions in general use about which there has been and still is such muddled thinking. A clearer understanding of the purposes and policies connected with the phrase national defense may perhaps be derived by a consideration

of what answers the average man would give to the questions: Defense of what? Defense against what? Defense by what means? Broadly speaking the average man would reply to the first question by saying that it is the territory of his national state that he wants to be defended. Some people would add that they want to be able to insure to their citizens abroad the treatment which civilized men are entitled to expect in countries other than their own. Some would add that they want to protect the vital interests of their nation in any portion of the world where they may be menaced. Twenty years ago they would have added national honor to vital interests. Some of them would interpret vital interests to mean a virtual claim that their nationals should receive privileged treatment in other countries, almost irrespective of what they might do. But roughly it is accurate to say that most people think the object of national defense to be the territory of their national state. Secondly, most people would say that the territory of their national state must be defended against invasion by foreign powers and, thirdly, that this defense must be effected and is capable of being effected only by the national armed forces which their own government maintains.

More theoretical considerations of the principles underlying the concept of national defense have usually followed two lines. The first theory starts from the assumption that the vital interests of different nations are by their essential nature in conflict. It follows that war is an inevitable fact of human life, and indeed the most important fact so far as international relations are concerned. Since for every nation war sooner or later is bound to come, and since war may involve even the very existence of the nation, it is the duty of each nation to make every effort to insure that it shall not be defeated in the wars in which it is bound to be engaged. Its purpose therefore in its policy of national defense is not to avoid all war but to secure victory in wars which cannot be avoided. Since its vital interests are by their very nature in conflict with those of other nations, it must clearly rely upon itself alone. In other words, it must in time of peace make such preparations for war that it will be strong enough to resist the challenge of any other nation which may attack it.

To this end each nation must be prepared, both in peace and in war, for any sacrifice that is likely to increase its military efficiency.

It must, for example, sacrifice economic well being and deny its citizens the advantages of the division of labor on the international plane in order to render itself independent of foreign supplies of commodities and goods which are vital to its existence. With this in view it must develop industries which are not economically self-supporting; it must raise the cost of food to its citizens by prohibitive protection. It must expand its territory, by colonial and other conquest, to widen its sources of raw material. To increase the scale of its industrial output it must apply the principle of "mercantilist" exploitation to all the territories under its control. To develop its man power and increase the number of its divisions available in time of war it must not only adopt the system of universal conscription for its own citizens, but it must assimilate the population of all conquered territories and impose the same conscription upon them. It must seek by all the means in its power to raise the birth rate of its own citizens and must do so without regard to the economic results. Having maximized the number of soldiers which it can call to arms, it must equip them with the most powerful armament that science and industry can provide. It must seek by every means to increase the quantity of its weapons and to improve their quality. In order to improve their quality it must organize and equip a system of scientific research and must endow it with the resources necessary to enable it constantly to study every new armament development throughout the world and the means by which its own weapons can be made increasingly destructive. In order to increase their quantity it must prepare in peace time the mobilization of its entire industrial resources and must subsidize private enterprises to maintain machinery and workers capable at a moment's notice of starting armament production on the largest scale.

The classical statement of this theory of national defense is that made by Winston Churchill when he was first lord of the Admiralty in 1913. "There is only one way," he said, "to ensure peace, and that is to be so much stronger than your enemy that he will never dare to attack you." The theory is sufficiently tested by considering what will happen when two neighboring states both endeavor "to ensure peace." The theory in fact defies arithmetic, for it enjoins on every nation an endeavor to be stronger than the rest.

A development of this first theory of national defense is furnished by treaties of military alliance. Since it frequently became evident to governments and peoples that they could not hope by their own efforts alone to be stronger than any other nation which might possibly attack them, they sought to secure the desired superiority by military alliances with other states which had "the same interests." This phrase, "the same interests," usually meant that the various allied states were all preparing for war with the same potential enemy; it would be difficult to find in the history of military alliances any other intelligible meaning. The alliances made were, by the nature of the case, both defensive and offensive, since the fundamental fact upon which they were based was that none of the allied states could afford to allow one of their number to be defeated alone, for that would only insure its own defeat in the succeeding conflict. This in turn meant that the allied states were in a considerable measure obliged to give diplomatic support to each other, whatever policy they might respectively pursue. There are many examples—one is that of Great Britain and Russia before 1914—of liberal powers being obliged by the entanglements of alliances to condone illiberal policies of which their peoples strongly disapproved.

This first theory of national defense is a theory appropriate only to a condition of world anarchy, in which there is no organized international society, in which nations live in a state of nature. As soon as a condition of greatly multiplied and intensified relationships springs up as between nations therefore, it must be expected that this theory will cause the nations the same difficulties and inconveniences that individuals experience when they live in a state of nature. In practice it can never really insure national safety except for the most powerful states and then only, as history has shown, of the most precarious kind.

The second theory of national defense now current is the exact opposite of the first in almost every particular. It was perhaps best stated in a resolution adopted by the Assembly of the League of Nations in 1927 in which the Assembly declared that states could disarm only in proportion as they need not rely upon their own respective national armaments alone. This was an authoritative and most important interpretation of the Covenant of the League, which enjoins disarmament but which also creates a

system of mutual assistance—including military assistance—for any member of the League which is attacked in violation of the Covenant.

Numerous attempts have been made since the establishment of the League of Nations to create an effective system that shall insure national defense by collective international effort and to substitute this system for the old anarchic system described above. The attempts have all aimed of course not at victory in war, but at the prevention of all war. They have therefore been based first upon the partial and later upon the total abolition of the legal right to go to war. They have involved the creation of a new and complex law and machinery for the peaceful settlement of international disputes—a law and machinery which include the Council of the League, the Permanent Court of International Justice, the Optional Clause and the General Act. They have involved efforts to render the system of the Covenant more efficacious, by specific obligations for preventing the outbreak of war, such as the treaty to improve the means of preventing war, and by specific obligations to give military and other assistance, such as the Locarno pacts and the treaty of financial assistance. They have, in article 20 of the Covenant, categorically forbidden offensive alliances. They have produced successive efforts to make the operation of the Covenant more certain in time of crisis, by providing a definition of aggression which shall lay down in specific legal rules what are the definite acts that the new law against war has forbidden.

In all these respects the attempts to insure national defense by a collective international system have followed closely the precedents set by all civilized national societies in their efforts to suppress violence and disorder and to establish the majesty of the law within their respective frontiers. In other words, the second theory of national defense is the theory of an organized international society, with laws and institutions similar in main principle at least to the laws and institutions of civilized national states.

Both of these theories have been and still are held simultaneously by the same persons. Undoubtedly before 1914 the nations of the world lived in a "state of nature"; the predominant theory was that of anarchy; and it is hardly too much to say that there was a constant anticipation of the outbreak of war. Yet there were two mitigating factors. First, the nations in certain

regions—in particular Scandinavia and North America—had eliminated war and substituted arbitration in their mutual relations. This was most probably due to their geographical isolation, racial affinity and higher level of civilization. The second mitigating factor was the dominance in the international policies of the nineteenth century of the ideas of balance of power and of the European Concert. While anarchy predominated in theory before 1914, and reigned supreme in practise, the contrary ideas were already acquiring significance. They had produced the arbitration movement, the Hague conferences and other beginnings of international organization, which are not without real historical importance.

If anarchy was the prevailing theory before 1914, organization is the prevailing theory today. By the Pact of Paris, by the Covenant of the League and by a host of other documents the governments have pledged themselves to the second theory of national defense. Their choice has been made officially, publicly and in great part without legal possibility of revocation. They are pledged to the new collective system by law, honor and sacred obligations to their respective peoples. Faced by the results of the old system, they have chosen to create the new.

Yet in practise the policies of governments are founded far more on the old theory than on the new. Armament competition, in spite of the Disarmament Conference, has hardly ever been keener than it is today. Vaster sums than ever before are now expended on qualitative improvement by scientific research. The governments have allowed the new system of mutual assistance to collapse in the Manchurian dispute. The policy of economic self-sufficiency for military ends has never been so actively pursued, as, for example, in Hitlerite Germany. The organization of industry for war production has never before been so perfect. The alliances of post-war Europe, although ostensibly founded on the Covenant, are difficult to distinguish in their practical effects from those of the past. It was this complete confusion of ideas which led to the prolonged disappointment of the Disarmament Conference, which permitted the outbreak of war in the Far East and which greatly accentuated, if it did not cause, the world economic crisis.

The experience of the second theory of self-defense and of the new collective system built upon it has proved that this system is practical

politics. It has to its credit important results in insuring national safety by preventing war. It is plain indeed that this new system could easily be made to work and to end war in the lifetime of the present generation, if the great nations of the world would decide to uphold their pledges to the new system. Indeed the cooperation of any three of them without the smaller nations would probably suffice. But if the great nations will not make this decision, if they will not choose the new collective system, it is probable in the extreme that the old theory of anarchy will once more rapidly prevail. If armament competition and the policy of economic self-sufficiency are allowed to develop much further, they will eventually ruin all attempts at an organized international society.

The choice of the governments in favor of the new collective system will probably be made when they abolish the so-called "aggressive weapons." The deliberations of the Disarmament Conference have proved that the modern instruments of national defense have given an overwhelming superiority to the forces of attack. No expert has ever been able to show how civilian populations can be protected against poison gas. No expert has been able to show how air attacks can be repelled successfully. No expert has made even a presentable case for thinking that tanks or heavy artillery or capital ships are weapons of defense. Whether by reference to the fixed standard of the existing armaments of certain disarmed states or by reference to the actual defenses which states are able to bring into being, it has been shown that these weapons are primarily of value for attack and that their disappearance would greatly strengthen the true national defense of every country. The gradual abolition of these weapons will achieve "qualitative disarmament" and also effect an immense quantitative reduction of the armaments which now exist. But it will also give the most important of all possible demonstrations to the world that nations do not intend to attack their neighbors. Thus it will give form and power to the choice of the governments in favor of the second, new theory of national defense by collective action.

NATIONAL ECONOMIC COUNCILS. Since the World War the creation of national economic councils, with advisory or even legislative functions, to supplement the activities of politically representative bodies has been agitated in most and effected in a number of the occidental countries. The function and powers of such councils vary from the complete control of economic planning, as by the National Council of Supreme Economy in the Union of Soviet Socialist Republics, to the mere supplying of technical information or advice to a parliamentary minister or cabinet.

In spite of such wide differences in their effective powers, however, such councils all represent a reaction to certain conditions and theories which are becoming increasingly important in the modern world. The idea of a closer coordination of economic interests and political government has been advanced, on the one hand, by those who wish to stem the rising power of large industrial combinations, on the other, by those who desire a greater influence for business interests based perhaps on a modern form of guild organization; and from a different point of view by theorists who have become convinced of the inadequacies of territorial representation and look to some form of pluralistic organization which would make democracy workable.

The representation of occupational groups and interests is indeed not new either in theory or in practise. The mediæval class constitution of society involved the making of the various classes in their regulated groupings into organs of the state. Concrete interests were thus given general political functions. In such a system, however, new forces and tendencies came to power with difficulty, until with the rise of the bourgeois groups the system was destroyed and for the representative of concrete interests was substituted the general mandate, the political representative and the political parliament. This parliament presupposed, in theory, the abstract

citizen moved by universal principles, liberal or conservative.

But every government must retain the confidence of the various extraparlimentary forces and understand not only the popular mood of the moment, as mirrored in election results, but also the deeper and more constant interests of the great economic groups. Such groups never ceased to exist even when in theory free competition was the dominant principle of organization. The guilds did not entirely disappear until about 1848; and it was not much later that there arose all over Europe associations of industrialists, organizations of merchants, and labor unions, representing groupings of identical interests with power that could be brought to bear upon the government, and in varying degrees in different countries participating in the shaping of legislation and of economic policy. Whether directly consulted or not, the organizations of interests have always had a certain weight in parliamentary democracies as well as under modern dictatorships. Whatever the form of government, the significance of industrial organizations necessarily increased as the belief in the utility of *laissez faire* vanished. The more complicated the organization of industry became, the more necessary was industrial legislation; and this in turn made imperative some form of representation of industrial interests in the government. This first came about through the rivalry which developed in most countries between the different political parties for the support of the various voluntary associations and economic organizations. A more or less definite representation of economic groups in parliament thus resulted from the coordination of political parties with particular interests. In most countries the conservative parties tended to be agricultural, while the progressives were associated with industry and trade; the socialist parties were of course connected with the trade unions; and none could have secured so permanent a footing among the electorate without the support of the respective organizations.

This development was early reflected in political theory. The doctrines of Saint-Simon and of Proudhon gave widespread currency to the idea of an economic as contrasted with a political organization of society. Toward the end of the nineteenth century, and with increasing force up to 1914, the notion of economic, or occupational, representation was agitated among political scientists, particularly in France and in Germany. Karl Planck and Schäffle, Charles Benoist

and Léon Duguit were among its outstanding exponents. The rise of syndicalism in France and Italy and of guild socialism in England gave a new emphasis to the discussion. These different groups envisaged many different methods of securing the representation of economic interests, from the supplanting of parliaments and universal suffrage by national associations of occupations to the creation of a second chamber representative of economic groups and functioning as one organ of parliamentary government.

Recent interest in the problem has brought to light the fact that there were several practical attempts at the formation of economic councils in the nineteenth century. In 1848 a short lived economic council was set up by Louis Blanc and the Commission of Luxembourg. A more important experiment was that of Bismarck. With the adoption of a protective tariff system in 1879, with the multiplication of problems demanding social legislation and with the increasing need for reform of the imperial finances Bismarck conceived the idea of setting up an economic council both as a new source of information and as a political safeguard for himself. A Prussian Economic Council (*Volkswirtschaftsrat*) was created by a royal decree of November 17, 1880, and opened in January, 1881. It consisted of 75 members, some appointed directly by the king, some proposed for appointment by boards of trade, agricultural societies and labor organizations. The Prussian council was intended by Bismarck merely as the forerunner of an economic council for the empire, but proposals for such a body encountered violent opposition in the Reichstag, which suspected an attempt to limit its powers. What the government actually desired was not a representative body with legislative power but simply an organ for the clarification of opinion and the provision of expert support for its practical decisions. Although the idea of an advisory national economic council was frequently discussed after 1880, particularly in connection with electoral reform, it was not put into effect until after the World War; opposition in the Reichstag was too great and the economic groups themselves preferred to work through that body. The Prussian Economic Council met only three times.

The closer national coordination of economic activities in all the belligerent countries during the World War gave new impetus to the demand for economic representation. But the dominant influence in the immediate post-war years was

the example of the Russian system of workers' and peasants' councils. An experiment with this form of direct representation had been made in Russia during the 1905 revolution. In 1917 the workers' and soldiers' councils were first the essential organs of revolutionary activity and later the basis of the Soviet system, with the result that throughout central Europe the idea of economic councils received a new direction and force. In Germany workers' and soldiers' councils were organized after the Armistice, and with the subsequent collapse and dissolution of the imperial and provincial parliaments power passed first to these councils. Actually their power was never more than nominal—such large unwieldy bodies could exercise control only through deputies—but, more important, most of the public officials gave recognition to "the existing state of facts" and were therefore almost without exception left in undisputed possession of their functions. One group among the working class saw in these councils the basis for an entirely new governmental system modeled on that of Russia; but in the country as a whole, in labor groups and in the army, the conservative forces were in the ascendant. The first wish of the majority, even of socialists, was to rebuild the economy shattered by the war.

Although the majority socialist leaders gave no encouragement to the council idea, strong popular support developed for a proposal put forward by Max Cohen and Julius Kaliski for the setting up of a national chamber of labor (*Kammer der Arbeit*), based on a system of advisory labor councils but including also representatives of civil servants and the liberal professions and having equal powers with the Reichstag. All these discussions could not but have an influence on the national assembly which framed the Weimar constitution. The compromise finally arrived at was embodied in the well known article 165. This article declares first that industrial and clerical workers are to cooperate with the employers not only in the regulation of wages and working conditions but also "in the entire economic development of the forces of production." This cooperation was to be achieved through the creation of local works councils, regional labor councils and finally a national labor council. Of all these institutions only the local works councils were actually formed (see INDUSTRIAL RELATIONS COUNCILS).

It was also intended originally that the regional and national labor councils were to work with representatives of the employers and other

groups as regional and national economic councils. Such regional economic councils also were never convoked. Thus the national economic council as finally constituted was an independent organ rather than the most important of a series of representative bodies. In order to take care of all the groups clamoring for representation the size of the body was increased from the 100 members originally proposed by the government to 326. It included representatives of several principal groups: agriculture and forestry, 68 seats; horticulture and fisheries, 6 seats; industry, 68 seats; commerce, banking and insurance, 44 seats; transportation and public undertakings, 34 seats; artisans, 36 seats; consumers, 30 seats; officials and academic professions, 16 seats; in addition there were 24 experts to be appointed by the government. Detailed provision was made for the distribution of seats as between employers and labor in the occupational groups.

Although the national economic council was an advisory body, its powers, as envisaged in article 165, were not negligible. The administration was to submit to it all bills relating to fundamental social or economic policies before submitting them to the Reichstag and to transmit the opinions of the council to that body. Moreover the council was to have the right of initiating such legislation and having it defended before the Reichstag by one of its members. This last power, however, was not conferred on the provisional council as it was finally set up; it could submit to the Reichstag only such proposals as were accepted by the government.

With the organization of the council a number of changes of procedure developed. In the first place it soon became evident that the division on the basis of occupational groupings was far less significant than that between social classes. A new alignment of three groups, employers, workers and the public, soon became dominant and was recognized in the constitution of the committees which soon came to transact most of the work of the council. After 1923 the council never met in plenary session; and while the number of members was not reduced, the actual work was carried on by 110 active members.

As a result of this somewhat motley constitution the national economic council was little adapted either to harmonizing the interests of the various groups or to weighting them according to their relative importance. Its resolutions therefore came to have the force not of decisions but rather of opinions and contrary opinions. It represents a form intermediate between a

weighted representation of all economic interests and a representation of the whole people apart from their group interests. Its members were not bound by instructions and were supposed to have the common welfare in view; nevertheless, its resolutions were almost inevitably based upon interest groupings. The economic council set up in 1920 carried in its complete title the word provisional, and it was the intention of the government to experiment with the institution before making it permanent. In 1926 and again in 1930 bills were submitted to the Reichstag, carrying the recommendations of the council, for giving a permanent constitution to the body. These bills provided for a reduction of the total membership and other detailed changes, but in general the nature and function of the council remained as before. The bill failed of passage because of conflict as to the distribution of seats and was then lost sight of in the parliamentary difficulties of 1931 to 1933. With the ascension of the Hitlerite government to power the future of the council becomes impossible to predict.

Although the idea of economic representation had been frequently discussed in France before the World War, and although the principle of consultative committees of interested groups had been made use of by a number of separate ministries and in connection with specific industries, it was not until 1925 that a national economic council came into existence. In 1919 the *Confédération Générale du Travail* had developed a project for an advisory labor council, and its minimum program for 1924 included a demand for such a body. In 1923 pressure developed for a different type of economic council when a group, drawn largely from the *Action Française* and monarchist circles, called an "assembly of notables" to discuss the idea of a mandatory organization of industry into guilds, on the basis of which a system of regional and national *états-généraux* was to be built. But it was the proposal of the labor group that inspired the appointment of a commission to study the subject and was largely reflected in the plan as drafted. The national economic council (*Conseil National Économique*) was created by executive decree of the Herriot government on January 16, 1925. The council has 47 members plus 2 alternates for each member, chosen to represent three groups—population and consumption, capital and labor. Although nominally the labor group has the largest number of seats, so many technical and management groups are included

in the category that actually the representatives of the wageworkers are in the minority and consumers and intellectual workers ordinarily have the deciding votes. The function of the council is purely advisory; it is attached to the Council of Ministers and unlike the German council does not have even nominal power to initiate legislation. The chief usefulness of the council has proved to lie in the assembling of technical information and the gradual reconciliation of conflicting points of view. In 1927 a bill was introduced in the Chamber of Deputies designed to give the council a permanent legal status, but up to 1933 had not been acted upon.

In Great Britain socialist and guild socialist advocacy of industrial representation has as yet had no practical effect. In 1919 the Lloyd George Industrial Conference proposed to set up a national industrial council composed of representatives of employers and labor to settle disputed problems of labor relations. This idea, like that advanced by the Mond-Turner conference in 1924, is really quite different from that of a national economic council representative of all the varying economic interests of a country. Equally remote from the complete council device was the Economic Advisory Council set up by Ramsay MacDonald under the Labour government, consisting of outstanding trade unionists, employers and professors chosen by him to give him advice. The proposal has been advanced to substitute for the House of Lords a House of Industry, an economic council with real powers of control and planning; but thus far the powerful position of Parliament and the dominance of ideals of political democracy have precluded the formation of any such body.

Tentative experiments with advisory councils have been made in a number of the European countries since the World War. In Belgium and in Greece discussion of the council idea was linked up with proposals for far reaching second chamber reforms, although in both cases the councils finally set up—in 1930—had little more than advisory and research functions. In a number of countries bodies with the title of economic council are merely technical adjuncts of ministries or departments of government. The Italian *Consiglio Nazionale delle Corporazioni*, like the Soviet supreme council, is really in a class by itself because of its relation to the entire structure of Fascist government. It is designed as the central body of the corporations into which all employers' and employees' federations

are organized, although its influence has not as yet been very extensive.

In the United States proposals for the establishment of a national economic council have been closely linked up with the more or less vague schemes of economic planning which sprang up as a result of the depression following 1929. The conceptions of various groups, ranging from that of a body with complete control of the economic life of the country to a mere advisory body to the president, were brought out in the hearings on the La Follette bill to establish a national economic council held before the Senate Committee on Manufacturers in the fall of 1931. The idea attained a certain popularity but has not resulted in any action.

The great hopes aroused by the setting up of economic councils have not been fulfilled. The councils as constituted could not take over tasks of industrial administration because they had no executive powers, nor were they able to further the socialization of industry. Although most important economic and political problems have been discussed, it cannot be said that any idea of outstanding importance or any particularly happy realistic solution has resulted. In Germany, although the national economic council has the right to make investigations, a large semi-official committee of inquiry was formed quite independently of it and has prepared a series of studies of German economy which runs to many volumes (*Ausschuss zur Untersuchung der Erzeugungs- und Absatzbedingungen der deutschen Wirtschaft*). The German national economic council became indeed an advisory board whose significance was small in comparison with that of the great organizations of interests on the one hand and parliament on the other.

The cause of this difficulty is to be found in the very structure of the modern state. Modern industrial states are dependent upon a final harmonization and rationalization of public opinion in a parliament functioning by majority vote. In the years 1918-19, under the influence of the war organization and of the Russian Revolution, many people envisaged a direct integration of industry itself into a harmonious whole. They looked therefore to representative bodies of industry for the realistic solution of the new and difficult problems of reconstruction. But it soon became evident that economic interests could not be solved in purely quantitative terms; that there was no way by which such an economic council could arrive at conclusions that would

be universally accepted. It became clear that all economic organization is at the same time political will formation, and that the political will can only achieve legislative formulation through the partial exclusion of economic interests and the dominance of more general social aims. Increasingly therefore the German national economic council as well as all those created with less ambitious programs has had to assume the role of a purely advisory body.

Even the corporate state erected in Italy does not in fact create any new industrial form; the capitalistic economy remains, and the power of the corporations is probably not so great as that of the industrial associations in Germany. It is even said by some that the German system of wage agreements fixed largely by arbitrators constitutes a cessation of self-government in industry. While that is an exaggeration, this machinery undoubtedly represents stronger and more realistic formative forces than do the economic councils, which are in the main but a meeting place for representatives of various interests, who have the utmost difficulty in striking out for themselves any unifying line of action.

It is too early to judge whether in Fascism the economic interests will reach some final and satisfactory adjustment. For the present it must be admitted that neither in economic councils nor in dictatorship has a substitute been found for the forces of conciliation in parliamentary government which have in the past led to solutions that were often compromises and certainly not satisfactory but were at any rate realistic.

NATIONAL ECONOMIC PLANNING is a somewhat more vague concept than the corresponding German *Planwirtschaft* (planned economy). Although both imply the incorporation of planning institutions into the economic system, the former does not involve any definite assumptions as to how far the state itself is to become the organ of administration—whether it should set up agencies for the direction of the economic system or merely introduce more or less far reaching measures for the planned organization of economic life upon a national basis. National economic planning, as used by different writers, may mean anything from the introduction of partial planning measures to the complete transformation of the entire economic system upon a socialistic basis. *Planwirtschaft*, on the other hand, involves the idea of control of the economic system in its entirety, and controversy hinges only upon how this assumption of control by the state can best be realized. Such difference of agreement as to method accounts, however, for the variation in schemes for economic planning even among socialist theorists.

All ideas of planned economy have one fundamental assumption in common—that under a capitalist system periods of prosperity are inevitably followed by serious crises, which tend to become increasingly severe. In succeeding crises the self-generating recuperative powers of capitalism are more completely paralyzed by the very acuteness of the crisis and by the growing inflexibility of prices. The idle worker is left face to face with idle machines and production is suspended, while the profit motive ceases to operate. In a planned economic system, however, production would be carried on to meet the needs of the inhabitants without any regard for profit. Thus, basic to all ideas of planned economy is the notion of a better system under which crises may quickly be overcome or prevented altogether.

Critics of the capitalist system seldom go so far as to deny that if the laws of the price process were given free rein capitalism too would reveal the workings of an unconscious plan. They point, however, to the fact that under capitalism the very development of the forces of production, which is its historic mission, leads to ever greater concentration of production and to monopoly. Every monopoly seeks increased profits through control of the market; this is possible only at the expense of the profits of those industries which still operate on a competitive basis. Monopoly profits, being utilized for the further expansion of production, bring about the disproportionalities which are among the most important causes of business crises. Monopolistic enterprise further seeks to keep up prices during a period of depression and consequently tends to aggravate it. Thus monopolies with their partial planning and organization prevent the realization of that unconscious balance which is theoretically possible under a system of free competition. There is moreover a wide difference of opinion as to whether a free competitive system, even if it could be maintained, would guarantee the maximum or the best possible production.

Economic difficulties since the end of the World War and the persistent spread of unemployment since 1929 as well as the intensification of the crisis by the interplay of political conflicts have so strengthened criticism and confirmed doubts as to the adequacy of the capitalist system that the idea of a planned economy has appeared among many different groups in almost every country. Much of this speculation has come from circles which did not entertain

any notions of opposition to the capitalist system until the hopelessness of general economic conditions revealed hitherto unperceived characteristics of capitalist economy. There is, however, nothing novel in the idea of a planned economy except the term itself and the concrete projects for its realization. Every socialistic system worthy of the name embraces such a notion. Every variety of socialism desires to eliminate economic exploitation of one individual by another, to make society master of the economic process and to provide for an equitable distribution of the most abundant production possible. This goal, however, implies the regulation of the flow of goods in accord with the needs of the masses, the imposition of control over the anarchy and inequity of capitalist production.

The proposed schemes for economic planning manifest the greatest variety. Any strict interpretation of the concept requires the exclusion of all measures and projects which seek to regulate only one part of the economic system. Such partial schemes of organization aim most often at the stabilization of the competitive, market system (*see* STABILIZATION, ECONOMIC) but fail to achieve this object simply because they have no total plan in view. On the other hand, attempts at the stabilization of production, and particularly of profits, in one industry alone serve to sharpen the conflicts and crises of the competitive system. A complete scheme of organization can never be achieved through the piecemeal regulation of individual parts of the economic structure. Only in one of two ways can such change be brought about: first, by the assumption of the control and the regulation of the basic industries which by their size and state of development are most essential to the economic system, in accordance with a general plan of production; or, second, by the control of the money and credit system, the institutions which regulate the distribution and the pressure of economic forces. In a highly developed capitalist system, however, reliance solely on this latter method would be incompatible with the desire to encompass and link up all phases of economic life. Probably the most fundamental distinction to be made in any attempted classification of proposed schemes for planning is that between capitalistic and socialistic plans—control within the bounds of the capitalist system as opposed to the substitution of a new form of economy. Some plans which may be classed as of the capitalistic type are based on a desire for increased business control, others on attempts at

the multiplication of progressive social agencies. Socialistic plans differ most sharply as to the desirability of continuation of the market price system within the scheme of planning (*Marktsozialismus*) as opposed to a complete administrative control of all economic processes (*Verwaltungssozialismus*). There are many planning schemes which defy any definite classification, and there are furthermore disagreements as to the best method of achieving particular systems of planning.

Some contemporary criticism of capitalism goes so far as to call for the abolition of all its characteristic institutions, including money. The demand for a moneyless economy is based on the belief that the money system is responsible for the exploitation of the needy and on certain confused ideas as to the existence of a money monopoly. Such critics contrast with this situation the methods and aims of technicians and organizers, who see in the economic system only a series of concrete fields of production, and then strive to construct a modern industrial order along purely technical lines. Unfortunately this view fails to take into account the social structure embedded in every economic system. A society thus ordered along purely technical lines would involve a form of complete administrative control, such that production as well as distribution *in natura* would be determined in advance—a kind of welfare economy (*Fürsorgewirtschaft*), which, since it would take all freedom from the consumer, could hardly be introduced either in western Europe or in America. Moreover such a scheme for a purely natural economy rests on the false assumption that money or some equivalent standard of value can be dispensed with. Its advocates fail to see that no economic order is possible without the homogeneous reduction of all the elements of production to one common denominator. So long as it is impossible physically to add cows and spindles, a purely technical construction of the economic system is out of the question. Such technical elaborations of the possibilities of production are nevertheless not without value, for they reveal what astonishing results can be expected, under favorable conditions, from a proper direction of the forces of production.

A number of contemporary economists have questioned the possibility of a socialistic economic system operating with money as the standard of measurement. The most frequent argument, first propounded by Max Weber and further elaborated by Mises, is that within a

socialist economy there is no provision for market control of the process of price formation and therefore no possibility of accurate evaluation of the forces of production. Particularly is it impossible to determine accurately the price of the means of production, since this can be worked out only in the market, whereas under a planned economy with no private ownership of capital there is no real market for the means of production. It is further argued that without price and profit as regulators of production the economic system would soon lose its direction, although it might continue to function for a time on the basis of previous production records. But disorder, disproportion of all sorts and finally the breakdown of all production would inevitably result. It is even contended that in such an economic system it would be impossible to achieve a sufficient correspondence between costs and returns from production, since the value of the means of production could not be established, and therefore consumption would have to be regulated dictatorially. Moreover, it is argued that within such a system the dynamic forces for the extension of production would soon be exhausted and the maintenance or increase of capital would become impossible.

This argument clearly envisages as the only form of planned economy a system under complete administrative control. But even such an economy would naturally have to apply internally the same criteria of measurement as those used by industry under the capitalist system, and standards which proved false would have to be corrected in the same way under a planned economy as under a capitalist economy. Finally, it is unreasonable to assume that in a socially planned economic system the important processes of capital depreciation and accumulation would remain hidden. For a socially directed economic system would have at its disposal almost complete statistical information concerning the forces of production and their capacity and would be able to gauge any retardation of productive capacity. Indeed it may be noted that even in the realm of theory it was the direction of attention to the economic system and the economic process as a whole—first stressed by Marx—which revealed the intimate relationship between the accumulation of capital and the development of productive forces.

The argument, advanced chiefly by Mises, that under a system of planned economy it would be impossible to determine the value of the means of production proceeds on the as-

sumption that concentrated planned production in a given industry can determine its costs and demand the corresponding price in the market, that each branch of production can do likewise, but that there is no possible way of measuring how rationally and usefully this capital and labor have been applied or whether a different distribution of capital and labor would not have been more advantageous. According to this view bad management could not be recognized. In opposition it may be pointed out that in no industry need production be so centralized as to preclude comparisons with regard to productive efficiency within the industry itself. Moreover, as has been noted by Marschak, Mises' argument is more applicable to monopoly than to planned economy; for in fact capitalistic production proceeds without much hindrance even when capital and labor are misused, since control of the market makes possible the raising of prices to cover costs and the exclusion of more efficient producers.

The evolution of the Soviet Five-Year Plan has demonstrated that it is possible to carry through the calculation of production without excluding the operation of the consumer's free choice. The supply of means of production also is regulated by present and expected consumption needs. In practice the chief problem involved in a system of economic planning is not that of calculation of demand but rather that of labor discipline and the relative evaluation of different kinds of labor. In this connection social concepts and their transformation under the stress of changing conditions play an important role. In the Soviet system, however, as in any economy, it is the distribution of income which determines the direction of production. Accumulation is specifically provided for either through additional increments in the prices of goods, through enforced savings or through taxation and presents no difficulty where energetic political means are resorted to for the compulsory creation of capital.

Special attention has been devoted by a number of economists to the possibility of a planned economy within a capitalist system. If the term planned economy is used strictly as referring to the centralized direction and administration of the entire economic system, it is in direct opposition to a system of production based on private enterprise. Completely free enterprise, however, has never existed. Every national economic policy affects in some way the entire economic system, whether it be the mid-

dle class policy of retarding the dynamics of the capitalist system, the social policy of limiting the free operation of economic forces wherever they lead to the misery of the working classes or the positive industrial policy of furthering the acceleration of industrial development through technical education or the imposition of tariffs. Nevertheless, previous economic policy within the capitalist system has never set itself the task of fashioning or directing the entire system.

The World War made necessary the most thoroughgoing centralized direction of economic organization which has ever prevailed under the capitalist system. In every belligerent country some scheme of central control was instituted, and it is doubtful whether the economic system in any of these nations could otherwise have supplied the necessary war output. The war controls were, however, designed rather for the protection of the capitalist system than as a step toward socialism. Indeed without some system of rationing the poorer classes in many countries might have been subjected to such widespread deprivation that revolution would have resulted. The problem of wartime organization was relatively simple; with few exceptions the aim was endorsed by the entire population. The dictatorial powers of the leaders, even over economic activities, were never questioned in most of the allied countries, and even in Germany they aroused no opposition among the masses until the last phase of the war. Such economic control was intended moreover only as a temporary device, although in Germany many of the measures were retained long after the conclusion of the war. It is true that in many of the belligerent countries the war organization closely approximated a planned economy. In Germany, for instance, the Reichs-Kohlenkommissar, by virtue of his control over the amount of coal to be supplied to each industry, to agriculture and to private households, was able to determine the extent of activity of each branch of production. Nevertheless, this did not involve a genuine system of economic planning but rather the application of a technical plan, and the difficulties brought about by rationing were overcome not by adjustment to market conditions but by the issuance of paper money.

The idea of a controlled economy prevailed in Germany for some time after the war. During a period when serious want contrasted sharply with great luxury it seemed the natural function of the state to provide at least the elementary needs of the masses. In 1918 a definite proposal

for a planned economy, based on the ideas of Walther Rathenau, was put forward by von Moellendorff and Wissell of the national Ministry of Economics. It provided for the creation of a commission composed of representatives of capital, labor, the consumers and the public which was to determine the general lines of production but not to intervene further in the productive process itself. It is quite evident that such a system could never have functioned. The capitalist, if allowed to retain his capital, cannot be told what or what not to produce. The direction of production in any economic system except one under strict administrative control cannot be accomplished directly but only indirectly by the regulation of income distribution. With the end of inflation this program lost its force, for then it was not goods that were lacking but money, and a change in the direction of production would not necessarily divert the flow of money into the proper channels. During this same period a plan for the socialization of the basic industries and especially of the coal mines was advanced by the first Socialization Commission. The report of the more radical majority of this commission was based on the same fundamental ideas as that of the Sankey Commission in England, although the two were developed quite independently. According to this scheme the mines were to be expropriated, but instead of being worked directly by the state they were to be under an independent management receiving its general directions from an official adviser, working with representatives of managers, workers and consumers. The aim was to leave the management free play but to incorporate it as an organ of society. Whatever the final merits of the plan, it did cast aside the idea of war socialism and endeavor to bring a socialized industry into a system of market economy.

An echo of the ideas of a war economy is to be found also in English guild socialism, particularly in its insistence that production should be determined not by the profit motive but by the needs of the population. Simultaneously there were also developed in England schemes for the nationalization of mines, railroads and the Bank of England; but details as to the method of creating a completely planned economic system out of the socialization of these key industries were never worked out. Such ideas of socialization were temporarily pushed into the background both in England and on the continent after 1927 as a result of increasing production. Particularly in the United States,

with its belief in eternal prosperity, reformism gained the upper hand both in social and in economic policy. The notion spread that steadily increasing production and more equitable distribution would result in a harmony of economic interests, thus reviving in another form the ideas of harmony in classical economic doctrine. Technical progress of all kinds, particularly rationalization, seemed to make possible a rapidly and constantly increasing production; and the effect of technological advance in throwing men out of work and in decreasing the possibilities for profitable investment was overlooked. The doctrine of high wages became popular, and in most countries it seemed that unemployment insurance would at least insure the working classes a minimum subsistence during the period of unemployment. Plans were advanced for the proper allocation of public works to lessen the dangers of crises, and the idea of credit control to regulate the course of business through banking policy gained many adherents. At the same time the idea of industrial democracy, demanding greater participation of the workers in the management of industry as well as representation for the consumers, found many supporters. In these latter plans there was a certain similarity to the schemes for national economic councils (*q.v.*) envisaged as the basis of a planned economy by one group of its advocates. Ideas of a planned economic system as well as schemes of socialization were thus in abeyance during the years 1927 and 1928; it was not until after the inauguration of the Five-Year Plan in Soviet Russia that the idea of a planned economy again came to the fore. But it was the crisis of 1929 and the succeeding depression which caused a revival and intensification of criticism of the capitalist system and which led to further elaboration of notions of economic planning.

For a number of reasons the idea of a planned economy became particularly popular in the United States. The boldness of the conception of organizing the entire economic system according to one plan enhanced its attractiveness. In no other country was the scourge of overproduction so strongly felt, particularly in contrast to the previous belief in ever increasing prosperity. Since the crisis in the United States could scarcely be ascribed to the interference of the labor unions, it was all the more evident that something must be wrong with the organization of the market and of production if increased efficiency resulted in poverty, and it was thought

that only a system of planned economy could resolve this paradox.

Theories of economic planning, as they have been developed in the United States, fall generally into two groups. The first consists of those advanced by supporters of capitalism who nevertheless do not believe that the automatic and spontaneous course of economic life guarantees permanent utilization of the productive forces or an increasing social product. Many individuals who formerly believed that under capitalism wages as well as tenure of employment would be permanently improved, and that the concentration of production and the organization of huge cartels would lead to the abatement, if not the total elimination, of economic crises have now become convinced of the fatal weakness of the present system and of the slowness of its recuperative processes and look for a way out in some form of capitalistic planned economy. Under such a system, as envisaged by some capitalists, they would be entrusted with the important decisions, while the authority of the great business concerns would be increased and the control of the entire economic system centralized. Such conceptions have given force to the drive for repeal of the antitrust laws and have led to ideas of the transformation of American capitalism into a system of gigantic and coordinated trusts under the direction of a central national council of the leading financiers and industrialists. It is hardly necessary to point out that such a system would be anything but socialistic in nature. The question of state control in any such scheme of planning also remains unsettled. It is at any rate inconceivable that if the direction of the economic system were to be placed in the hands of the industrialists, the administration of the state could remain independent of them.

The conception of a capitalistic planned economy raises an interesting problem. With full utilization of technical knowledge and with proper allocation of new capital the output of finished products, if not retarded by any further crises, must expand tremendously. A rapid increase of the income of workers and officials and a further reduction of hours of labor would result. It might be expected that there would follow a strengthening of the tendencies toward the socialization of industry, particularly as workers and officials gained increased insight into the problems of industrial management. The unorganized and therefore less easily understood capitalist system seems to the working

classes less susceptible of transformation into a socialistic system than would a completely organized capitalist system. It is not to be assumed, however, that many financial leaders are aware of this possible consequence of an efficiently organized capitalist planned economy. On the other hand, it must not be overlooked that an oligarchically organized capitalism always bears within itself the possibility of an openly Fascist development. For when the control of the means of production is concentrated and the economic system ceases to rest upon a wide middle class of independent industrial and business entrepreneurs, those in power must rely on ever larger armed forces to prevent the outbreak of social revolution. The only alternative would seem to be for the business leaders to mollify the great mass of people by a high standard of living, turning them into a self-satisfied middle class who would never become conscious of the possibility of social change. But at least the social history of Europe does not indicate any likelihood of such permanent leveling of classes.

The second group of advocates of a planned economy in the United States includes chiefly progressive intellectuals who formerly advocated economic reforms and radical social policies, such as the systematic development of public works to mitigate the effects of industrial fluctuations, unemployment insurance, more vigorous control of monopolies and to some extent credit control, although the far reaching influence of this latter device has not been so clearly recognized by these thinkers as by European theorists of planned economy. Such reforms involved merely the incorporation of socializing elements into the free economic system. With the crisis of 1929 these reformist tendencies became oriented about the belief that production should be directed not toward the making of profit but toward consumption needs. In aims and specific programs this second group therefore differs quite markedly from the first, since its adherents reject the idea of transforming the present economic system into an organized oligarchic business dictatorship and advocate a system in which the masses also would have some control of the direction of economic life.

If the concept of economic planning is viewed apart from its peculiar national variations, it is seen to present not only an economic but a social problem of the first magnitude. For the characteristic stamp of every economic order is derived

from the distribution of political power and from the social framework in which it operates. It is this fact which lends such significance to the controversy as to the possibility of a planned economy within a capitalist society. Every planned economic system must be based on a recognition of the unitary character of society. But such a viewpoint might often make necessary the renunciation by an entire industry of all possibilities of profit in the face of more important interests. How can such a result be achieved in a capitalist system? The more complex the organization of the basic productive industries, the more acute do such problems become.

If the question of the social distribution of power is set aside and only the problem of economic relationships and devices is considered, it is possible to envisage the setting up of a system of planned economy even within the capitalist order. A first prerequisite would be some arrangement making possible indirect control of the development of various branches of the economic system in proper proportion to one another, and of total production in proportion to market expansion. This could be accomplished only through some kind of central bureau for the distribution and direction of credit. Such a bureau would supervise the relative growth of individual industries and also the financing of new industries, in so far as these were made necessary by the technological displacement of labor. One of the most difficult problems with which it would have to cope would be that of self-financing. In a capitalist system this could not be controlled directly, since producers could not be forced to deposit their profits with a central banking system. A credit control bureau might, however, temporarily forbid new investments in industries which had expanded too rapidly. This is a device which has already been applied in a few specific instances, such as the prohibition of hotel building in Switzerland or of the sinking of potash shafts in Germany. The method is cumbersome, but it would prevent the most dangerous manifestations of industrial vanity or competitive struggle.

The planned distribution of credit would lead to a more balanced development of production. It is obvious, however, that under a capitalist system the aim of credit control would not always include the satisfaction of important social needs. Under such a system it would be impossible moreover to set in motion production to care for unemployed workers except through

public works schemes, and these could not be inaugurated on any wider scale than is at present possible. This type of planned economy would take its point of departure from the existing distribution of income and market demand. Its task would consist only in correcting the disproportionate development of production, viewed from the standpoint of market conditions; such changes in the distribution of income as were found to be essential to the better distribution of purchasing power could be brought about simply through taxation.

The free application of credit control and of more equitable income distribution would exert a real influence upon the development of the entire economic system, tend to prevent the most dangerous features of crises and facilitate the building up of the intermediate industries, which are so essential to the labor market. The fear, frequently voiced, that such a planned economy could not secure the necessary rate of capital accumulation is unfounded, since it could avoid the loss sustained by existing capitalist society which is due to the fact that a great part of the capital invested results in a simultaneous loss of capital at some other point in the economic system, and since it could rely upon the saving of capital made possible by the latest technical advances.

More serious difficulties arise at other points; for instance, in connection with foreign trade. Every system of planned economy must attempt to settle the question as to how far it should coordinate its foreign trade and convert it into a monopoly. In a country with a relatively large and varied foreign trade even the creation of a complete monopoly would not necessarily lead to economic planning. For so long as private production continued, such a foreign trade monopoly could only accept the orders of these producers; it would have no interest in decreasing exports and no power to increase them. It would be even more difficult to influence the direction of production through control of imports. Such influence is far more easily effected through control of the distribution of credit. Indeed the idea of a monopoly of foreign trade as it has been applied in most of the European countries in recent years is an outgrowth of the abnormal conditions during the World War and the succeeding periods of inflation. In so far as industry is socialized, it is natural for the related export and import trade to be under the control of the same agency; so long, however, as industry and agriculture remain under private control, foreign

trade cannot be monopolized separately. Apparent exceptions in the case of single products, especially raw materials, represent no tendency toward economic planning.

Under a plan which does not attempt a central administrative control of the entire economic system the great mass of processing and consumption goods industries can be controlled only indirectly. While the danger of overinvestment is not as great here as in the basic industries, their rate of increase must be watched; and in such industries too the question of socialization will arise wherever mass production develops. No one, however, would consider it possible to bring all such industries under one common economic organization at one stroke. And for the thousands of intermediate and lesser industries, particularly small scale agriculture, the magnitude and character of production need never be exactly prescribed in the total plan. For freedom in consumption also implies some flexibility in production; and a planned economy does not necessarily involve the abandonment of the advantages of free mobility of private industry to the extent that it remains free and private, as is no longer the case under capitalism in the giant industries. The line of demarcation between those processes of production to be directly managed and those to be only indirectly influenced would not be easy to fix and would no doubt be altered from time to time. Nevertheless, with the basic industries and the credit system under the firm control of a socialist planned economy, the smaller manufacturing industries could not become independent centers of power and might even be brought into some form of cooperative organization and thus be directly absorbed into the planned system.

One of the major problems of the capitalist system in its later phases has been the development of new industries to provide new opportunities for labor. Before the World War the opening up of precapitalist areas provided a wide field for capital investments. Since the war this process has stopped not only because of political insecurity but also as a result of the extension of technical progress to the production of the means of production. Under a planned system a reduction of hours of labor could offset the effects of technological advance. It would then be possible also to maintain in operation industries which yielded returns sufficient merely to pay for the costs of production, and hence production could be expanded even though

technical changes had removed the possibility of profits. The continuation or expansion of industry would be temporarily possible even at a loss, since it could be made up either through taxation or through a limited change in the value of money.

If under a planned economy the productive forces should not be fully utilized, it would be essential to expand those industries which produce consumers' goods. With a corresponding distribution of income this would be possible so long as the mass needs of the population were not completely satisfied. At this stage further technological advance would be taken care of by the shortening of the average hours of labor. If the need for work as a natural outlet of vital energy found insufficient satisfaction within the economic system, there would be other outlets in public and artistic activities. Even the mention of such a possibility appears completely utopian, and it is of course true that no planned economy could hope to develop its productive forces sufficiently to make such a condition possible within the immediate future. The length of time which would elapse before such a situation were reached would depend also on the degree of balance in the distribution of income achieved by the plan.

From an examination merely of the economic questions involved in the creation of a planned economy it is clear that the erection of such a system is not a purely technical and not even a purely economic problem. It cannot be achieved through reasoning alone, for no plan however perfect will be realized merely by virtue of its perfection. The construction of a new economic system depends more upon the distribution of power than upon the elaboration of concepts, and common sense fails to reveal the path on which all social forces will unite. The real social problem involved is that of the nature of the social framework within which the economic system should be constructed.

A survey of present day capitalist society indicates some of the probable lines of future development. The system of free competition has in fact already been narrowly restricted, although intellectually it still holds sway. In Germany in particular there has been considerable intrusion of the will of the state into the direction of the economic system. Nowhere in Europe is the power of the working classes great enough to exert any decisive influence upon the course of economic policy, although it is sufficient to offer prolonged resistance to a lowering

of their standard of living. The direction of the entire economic system is in the hands of the capitalists and bankers. Viewed from the aspect of the social distribution of power, the economic order is today in a transitory state in which elements of free competition are mingled with elements of partial organization. Such an "order" contains within itself the greatest contradictions. The energy of the entrepreneur has no sufficient outlet, while the regulating forces are too weak to bring about a better organization of the entire system. Nevertheless, despite its obvious failings such a condition may well endure for a long time. Those in possession of the economic control will certainly struggle to retain their power as long as possible, utilizing their political strength to gain popular support and where possible the acquiescence of the workers. A return to competitive capitalism is not to be envisaged, since technological development alone has made inevitable the transition to giant industry and even to monopoly. Nor is it possible to undo the concentration of the banking system, since in many countries the state has become in practise the guarantor of the total deposits of the great banks. While central control of the disposition of society's capital may result, real planning is still far distant. Even in central Europe it is not likely to be brought about by any sudden political upheaval. The middle classes can too easily be mobilized against any attempt at a real planned economy; for although in times of crisis they are always disposed to indulge in anticapitalist phraseology, they are instinctively strongly bound to the capitalist system.

There would thus seem to be two possibilities of future development. The first is that, faced with increasing difficulties and the aggravation of the industrial crisis, capitalism itself will be forced into radical socialization of the basic industries and establishment of control over investments and credit. Such a step would result in a real postponement of social reconstruction. On the other hand, it is not at all impossible that an expansion of world production may follow the present depression, particularly with a clarification of the relations with and in the Far East and with the participation of capitalist countries in the development of these areas. In such an event, while it is not probable that all the unemployed would be reabsorbed, stability would increase and capitalist economy remain in a transition stage in which elements of free enterprise would be mingled with regulating forces.

It is idle speculation to inquire what the final stage of such development would be or through what steps it would pass. An attempt to foresee the course of economic development may be likened to wandering in a fog: one can recognize only the immediate step ahead. It is the sense of direction which offers the sole security, and the direction of modern society would seem to be toward a planned economy.

NATIONAL INCOME may be defined provisionally as the net total of commodities and services (economic goods) produced by the people comprising a nation; as the total of such goods received by the nation's individual members in return for their assistance in producing commodities and services; as the total of goods consumed by these individuals out of the receipts thus earned; or, finally, as the net total of desirable events enjoyed by the same individuals in their double capacity as producers and consumers. Defined in any one of these fashions national income is the end product of a country's economic activity, reflecting the combined play of economic forces and serving to appraise the prevailing economic organization in terms of its returns.

Being thus a summary and appraisal notion rather than an analytical entity, national income demands statistical measurement. It has been estimated in money terms over a number of years for the principal countries of the world. A selected group of such estimates is given in Table 1. Specific measures of this type seem at first glance to convey information of crucial importance. Since the end product of each country's economic system is an index of its producing power, income estimates furnish a comparison of the productivity of nations. Per capita income figures, especially when adjusted for differences in purchasing power of money, appear to measure the nation's economic welfare. A continuous series of annual estimates of total or per capita income would reflect also the constancy of the income flow, another important criterion of economic welfare, and, if the series were long enough, would suggest whether the nation tended in the course of time to grow richer or poorer and how rapidly the change was taking place. Estimates of total income are also employed in ascertaining the proportions in which it is or may be divided among social classes, between the community and the individual, between consumption and capital accumulation, and the like. However used, figures like those given in Table 1 appear to be quite serviceable; they seem to measure in comparable units something quite definite and significant.

Further investigation reveals, however, that the clear and unequivocal character of such

TABLE I

TOTAL AND PER CAPITA INCOME ESTIMATES FOR VARIOUS COUNTRIES*

* The total income of each country was converted into American dollars on the basis of the average rate of exchange of the corresponding year and divided by the population figure to give the per capita income in current dollars. The total income of each country, expressed in its own currency, was deflated by the wholesale price index for that country with 1913 as the base year, converted into American dollars on the basis of the rate of exchange in 1913 and divided by the population figure to give the per capita income in 1913 dollars. The quotations of exchange rates used are taken from J. R. Mowd, "Handbook of Foreign Currency and Exchange," United States, Bureau of Foreign and Domestic Commerce, *Trade Promotion Series*, no. 102 (1930). Wholesale price indices are taken from W. C. Mitchell, "Index Numbers of Wholesale Prices," United States, Bureau of Labor Statistics, *Bulletin*, no. 281 (1911) and from Canada, Dominion Bureau of Statistics, *Prices and Price Indexes, 1911-1912* (Ottawa 1932). † Excludes income from personal services.

estimates is deceptive. Theoretical problems arise in delining the area of "nation;" in the choice of stage in the circulation of commodities and services at which income is to be segregated and measured; in the inclusion, exclusion and basis of evaluation of various commodities and services that are to be added into a national total. Finally, variations among estimates may arise from differences in the types of statistical data used and methods employed.

Problems in regard to the area covered by national income estimates are due to differences in the location of productive agencies and in the political allegiance and place of residence of

their owners. We may thus distinguish productive agencies located within the boundaries of the given state (*A*) from those located outside (*B*); and among them, those owned by subjects of the state residing within its boundaries (*aA* and *aB*) or outside (*bA* and *bB*) from those owned by aliens residing within the given state (*cA* and *cB*) or residing outside (*dA* and *dB*). The strictly political definition of the area of national income would then include *aA*, *aB*, *bA* and *bB*, and the purely territorial definition would include *aA*, *bA*, *cA* and *dA*. The definition used prevalently in national income estimates does not follow either the strict political

or the territorial principle but that of residence of the owner of productive agencies, thus including aA , aB , cA and cB .

This definition conceives a nation as basically a group of residents within state boundaries and thus anchors national income to the material base of the economic system whose product is being measured. It is preferable, from the point of view of economic analysis, to the purely political definition of the area. But it departs from the territorial principle by including in national income receipts from capital invested abroad, by excluding payments on foreign capital functioning in the country and by counting into national income the earnings of shipping and other internationally operating agencies owned by the country's residents. The property principle is thus allowed to cut across the territorial base, implying the existence of normal conditions in the sphere of international trade and capital movements.

There remains a question as to the serviceability in economic analysis of area units, defined by state boundaries and supplemented by areas of net foreign investment and activity. In a political entity that happens to be a comparatively independent economic system, such as France, national income does measure the combined effect of related and integrated economic forces; but for economically dependent political entities, for instance, post-war Austria, national income ought to be studied in conjunction with the incomes of countries closely related; and a similar procedure appears advisable for a country with politically independent hinterlands. For many purposes the political unit approach, so prevalent in current statistical procedure, ought to be supplemented by a breakdown of national totals for some countries and a combination of national totals for other countries.

The preliminary definitions of national income given above distinguish income produced, received, consumed and enjoyed. The first three run in terms of commodities and services which are separable from the individual agents and capable of measurement in common units because of the leveling process of market valuation. The last runs in terms of subjective feelings, whose commensurability for various individuals is to be doubted and whose relation to the objectively perceptible economic goods is not, in the present state of knowledge, determined with sufficient precision to permit even purely qualitative economic analysis. Consequently the concept of income enjoyed has to

be abandoned in favor of such cruder approximations as income received or consumed. The consideration of the level of subjective feelings is not, however, completely omitted; it is retained as a background of the analysis of national income at the measurable stages of circulation of goods and services and dictates some of the methods of detailed analysis.

As between income produced, received or consumed, the choice on theoretical grounds depends upon the function which the income concept is expected to perform, either as a summary or as an appraisal notion. If the national income concept is a summary of the play of economic forces, the choice depends upon an analysis of these forces indicating whether production, distribution or consumption is the stage at which the combined effects of the factors analyzed appear most clearly. And if income is an appraisal concept, the choice depends upon the basis of the appraisal: economic power as reflected in total productivity (income produced), individuals' potential welfare as expressed in the purchasing power of the incomes received or individuals' direct welfare as reflected in incomes consumed. In addition there is another, subordinate basis of choice: the quantitative definiteness of the national income total as revealed by statistical practise. In such practise the attempt is to provide a measure that could satisfy more than one purpose; and income produced, as the concept of the widest reference, seems at first most suitable. From this one can, by segregating savings of business units, measure income received by individuals and, by further subtraction of individual savings, obtain income consumed. But the shift from income produced to income received involves an estimate of savings of business units, which is clearly affected by the accounting procedure, may yield widely varying results in different times or different countries and is not likely at any given time or in any given country to reflect faithfully the value of commodities and services produced but not made available to individuals. Similarly, the further shift from income received to that consumed meets an obstacle in durable goods, for which the estimate of consumption for any given year can be made only on the basis of forecasting the future from the past life history of such commodities. These difficulties are more than statistical: they indicate that in current reality the most clear cut, general concept of national income is income received by individuals; and that the uninterrupted flow

of commodities and services through the economic system is best arrested for the purpose of analysis and measurement at the point when the stream reaches the living individuals, after it leaves the productive units proper and before it has been diverted into the various channels of consumption. The discussion below of the contents of national income is carried on primarily in reference to income as received by individuals.

The inclusion, exclusion and evaluation of commodities and services that are to be added into a national total offer the widest range of theoretical problems. The modern economic system consists of individual units whose basic purpose is making a living; of purely business units whose main aim is the making of profits; and of social organizations whose primary purpose is to render service to society as a whole. Each of these groups contributes differently to the sum total of commodities and services produced and distributed, is motivated by forces of quite different nature and involves a different approach to income as an appraisal concept. In face of such diversity national income must be a single entity, reflecting the contributions of these various types of units and reducing them to a common unit of measurement. Since in the modern economic system it is the market, through its exchange of goods for money, that provides such a unifying mechanism, it is natural at first to identify national income with the sum total of money payments flowing to the individuals from the market. But such a simple definition immediately suggests a number of questions, arising from a conception of economic goods as having an existence and value independent of the changing market. These questions fall into three broad divisions: first, those relating to commodities and services to which there is no corresponding flow of money payments from the market to the individual; secondly, those relating to the exclusion of money payments to which no commodity or service corresponds, or to the adjustment of the money flow to reflect more properly the volume of economic goods involved; and, finally, those relating to the distinction between gross and net income.

Commodities and services to which no flow of money payments corresponds may be divided into three groups. The first consists of goods and services received in barter (as over against money exchange), such as farm rents paid in kind, food and board of farm workers, food, board and clothing of soldiers, sailors and all

employees whose subsistence in whole or in part is supplied by the employer. From the point of view of the nation's productivity or welfare the omission of such bartered goods would obviously understate the total performance of the economic system. The second group consists of goods and services received gratis. The difficulty here is not the lack of monetary form but the absence of any specific productive service rendered by the recipient. In such cases, since no production of new economic goods takes place, it appears advisable to exclude the goods from the national income total. If an individual receives charity or a gift this is but a loss on the part of the donor (whose income has been recorded fully elsewhere); and to count the incomes of both donor and recipient involves either double counting or the consideration of the charity or gift recipient as a producer of service to the donor, an obviously far fetched conception. The problem becomes more complicated when such free flow of goods (or money) is directed not from individuals but from the business system, either directly or through such social agencies as the government or charitable foundations. Such free goods, whether in form of money or of commodities and services, must obviously be counted in somewhere in the national total. While their statistical estimate is difficult, their analytical and quantitative importance is appreciable and likely to grow in the future. The third type of commodities and services for which there is no corresponding money payment comprises those produced and consumed within the individual economic unit. Here the main problem lies in the segregation of economic from non-economic activity, since only a rigid line between the two will enable one to include in or exclude from national income such items as commodities produced as a hobby, services of durable goods used in the household or personal services of housewives and other members of the family. But there is no hard and fast rule by which economic activity can be distinguished from social and individual life in general. The importance of economic motives, the regularity of the activity, the relative proportion in which the resulting commodities and services usually appear on the market—all have to be considered. For the modern western economic system no doubt appears as to the propriety of including in national income commodities regularly produced and consumed within the household when they form a part of a larger total destined for the market, most con-

spicuously, for instance, the share of the farmers' produce retained for their own consumption. Similarly, the estimate of national income should include net services from houses owned and inhabited; but there is considerable doubt as to the propriety of including net services of other durable goods, such as automobiles, furniture or clothing; and more doubtful still is the inclusion of hobby products, for which moreover no statistical estimate of value can be made. Finally, there is general agreement among students of the problem as to the exclusion of housewives' services and services of other members of the family, in spite of the very large size of the items involved. It is recognized that these activities are motivated very largely by non-economic considerations and form much more a part of life in general than of professional economic activity proper.

Being conditioned by the institutional set up of the family and of economic society, the line between economic and non-economic activity shifts from country to country and from time to time. The statistical investigator can lend formal precision to his definition and measurement by extending the area of economic activity all the way through the individual household and thus abolishing non-economic areas. He will then estimate the values of all personal services rendered within the household and avoid the paradox, mentioned by Pigou, of a decline in national income resulting from a man marrying his housekeeper or that of the increase of national income because of the shift of women into industry during the World War. Such income concepts, however, achieve consistency at the expense of reality, for they disguise the basic, if shifting, line of difference between economic and non-economic areas existing in real life. The alternative is to adopt a narrower definition of economic activity and allow it to shift, the resulting income measurement reflecting changes in time or differences in space in the performance of an economic system with a slowly or rapidly shifting area. The exigencies of statistical work render the acceptance of the narrower definition of national income almost inevitable, but without a recognition of the limitations involved in its use any comparisons of national income across wide time intervals or between countries marked by essential differences in the relative scope of the economic system are highly misleading.

If not all commodities and services produced (or made available to individuals) are reflected

in money flow from the market to individuals, neither are all money payments to individuals a *bona fide* reflection of economic goods produced or distributed. Such identity is lacking first in the case of gratuitous money payments, i.e. gifts, charity and relief. Like the similar flow of commodities and services, these should be excluded from national income totals except in so far as they constitute indirect flow from the business system to the individuals and have therefore not been recorded elsewhere. Quite analogous is the second group of cases, those in which money payments come before or after the service is rendered; the essential element in both groups is the fact of a money flow to individuals without a corresponding return within a given period of time. Hence pensions, disbursements by business enterprises out of surplus or capital, withdrawals of accumulated interest on savings by individuals, all may be treated in the same way as charity or relief. In so far as these payments flow directly or indirectly from the business system and have been deducted as expenses in arriving at net income, they should as a part of the national income produced be included at the point of receipt. In so far as they are paid by the individuals themselves out of their past or present shares, from which no deduction has been or is made, the counting in of such payments constitutes duplication. If for a given year the accumulated but not withdrawn interest on savings is counted into individual income, it cannot be counted again when such accumulated interest is withdrawn. The principle has a similar application in cases of such savings schemes as insurance or building and loan funds.

A much wider range of questions arises with a departure from the market valuation scheme as such, of which the first step is an attempt to adjust for changes in the monetary unit itself (statistical deflation). Of the numerous and intricate problems raised by this procedure only one need be mentioned here: the impossibility of getting price quotations for qualitatively uniform commodities over a range of time or from country to country. Deflations, while necessary, are consequently at best crude approximations; they are the less reliable the longer the span of time they cover or the larger the differences in the countries compared.

Two further groups of amendments to the market scheme are suggested by economic theory: one based on distinguishing economic activities by the material nature of the results,

the other distinguishing them by their organizational character. The first relates activity to wealth. Since wealth was originally conceived in material terms, only that labor was considered "productive" which resulted in material goods. This definition excluded from productive activity all services and considered incomes from services not as primary but as derived shares. While this point of view has proved inadequate, the distinction persists as a background to much current thought and retains its significance as a contrast which would be valid were our economic system to become again an economy of want rather than one of surplus. In such eventuality commodities as a whole, in so far as they form directly the support of life, would be more important than most services.

The principle of material productivity survives also in the still current distinction between productive and unproductive loans of capital. Capital invested in manufacturing, mining, trade and similar occupations is supposed to be productive because it facilitates the adoption of more efficient methods of production and thus results in a greater excess of product over outlay. Hence interest payments on such capital investment represent *bona fide* incomes and are to be included in national income. But loans to consuming bodies, whether individuals or public, are unproductive since they are used for direct consumption, a utilization which by its very nature appears incapable of yielding an economically measurable surplus. Hence interest payments on such uses of capital are only a draft upon *bona fide* incomes. This distinction, however, seems to arise from a failure to carry through logically the whole treatment of interest on capital and is, in the case of individual consumers, contingent upon the acceptance of some form of the iron law of wages. Consumers are generally also producers, and loans to them may serve to raise or preserve earning capacity. Additional objections are made by many students to the inclusion in national income of interest payments on loans to a public body, like the government, because of the further doubt as to the productive character of governmental activity in general. But so far as governmental activity preserves and raises the productive character of the economic system, interest payments on government loans are of the same economic nature as interest payments on privately invested capital. The current paradox that an increase in government loans would, if payments on such loans are included in national

income, serve to raise national income presents no puzzling aspects if it is realized that a rise in indebtedness of private industry would similarly raise the volume of national income.

At present a distinction more significant than that based on material productivity is the one between activities whose income yielding power is conditioned by the present organization of the economic system and those whose income yielding power would be retained or even augmented under a different social organization. The problem of services appears again here. The valuation of personal services sold on the free market is dependent upon the existing personal distribution of income—as manifested in the contrast between the emoluments of those who cater to the richer classes and the low rates at which a number of services are rendered to small income recipients. Should services be included at the high (or the low) prices which they fetch because of existing income distribution and thus be allowed to distort national income totals? The same question applies to commodities in which quality distinctions permit different pricing for various groups of income recipients. The problem may be generalized by recognizing that the extremely high or low valuation of some commodities and services is but a partial case of monopoly incomes, whether on the demand or on the supply side. Each investigator's economic philosophy will influence him either to acquiesce tacitly in the valuation within the current economic organization or to attempt some correction for its distorting influence. One might correct for the differences in valuation of the same commodities and services among the various income groups, just as one corrects for changes over time in the prices of identical commodities and services. One income group could then be adopted as a basic one (just as in the other comparisons some one year is taken as a base), and all commodities and services produced could be revalued at prices charged to this basic income group. The practical statistical difficulties of any such correction, however, are enormous, and it is rarely undertaken. Consequently a comparison of the absolute volume of national income among countries which differ greatly in the personal distribution of income and in the presence of monopolies, of so-called friction incomes, such as advertising, is likely to be misleading. Even for any one country comparisons of deflated income totals over a period of time are usually dangerous, in so far as the available price data reflect less adequately

than do the income totals the change in the monopolistic areas of national economy.

The monopolistic aspect of some income categories assumes a particularly interesting form in the case of government, where the problem arises as to the valuation to be applied to services thus taken out of the area of free play of economic forces. The question whether government services are paid at prices warranted by the free play of forces in a competitive market is at bottom unanswerable, for the simple reason that if such play of free forces yielded an effective measure of those services the latter would probably have been left to private initiative. Consequently market valuation of government services as a whole cannot be made, not even for separate groups of services, except for some highly specific units. It can be established whether the compensation of a government stenographer or postal employee is higher or lower than that of a similarly trained and employed person in private service, but for larger groups of government services it is not the free market but the court of enlightened public opinion that can pass judgment as to the presence or absence of excessive compensation. In statistical practise in the United States and most other countries incomes paid to government employees are included in national income, with the recognition that their monetary value is the only available, while admittedly rough, approximation to the value of services these employees render; similarly, pensions for past services and interest payments on loans are included as the equivalent of past and present economic goods produced. Taxes paid by business units are deducted in arriving at the net income of these units, just as are all other business expenses. But taxes paid by individuals are not subtracted from individual incomes, on the assumption that the value of government services to individuals is equivalent to the amount of taxes which they pay and should thus be treated in the same fashion as the individuals' expenses on food, clothing and shelter. This assumption, as indicated above, may not be strictly true; and the resulting free incomes or losses to individuals (flowing from the business system via the government) should be included in national income.

There is, finally, the possibility of a complete abandonment of economic bases of valuation and the substitution of norms derived from other sciences. National income and individual incomes might be expressed in energy units, labor

hour units or other standards. Theoretically feasible as such shifts may be, they are as yet not sufficiently developed to merit extended consideration. One distinction, however, is of some importance—that between wantability and usefulness. For it raises the question as to the inclusion in national income of the harmful commodities, like opium, and of other commodities or services that appear completely useless from the point of view of a physically and psychologically normal individual. Some practical aspects of this question are predetermined by the fact that with legal prohibition of certain commodities and services an adequate quantitative determination of their volume becomes almost impossible. On the other hand, data of income tax statistics often include receipts from illegal activities. Theoretically an attempt to make national income a gauge of scientifically determined, real welfare of the population involves an unwarranted optimism as to the validity of sciences concerning human nature. From another point of view, that of the nation's productivity, it should be recognized that the diversion of a certain part of the nation's resources to the production of what appear to be useless commodities is not irrevocable; the capacity of a nation to restrict its production of non-necessaries and increase the volume of necessities depends largely upon the proportion of resources devoted to the former. It would be a highly misleading picture of comparative productivity of the two economic systems to compare only the output of necessary commodities and services in such countries as the United States and Soviet Russia.

The third group of problems in the determination of the specific contents of national income arises from the fact that during normal times, when a consideration of the future is of importance, the performance of the economic system is gauged not by the gross but by the net product, i.e. by the volumes of commodities and services remaining after the replacement of capital outlays; or, in terms of individual and corporate receipts, by the sum of incomes received after subtraction of expenses incurred.

The most important point in the distinction between gross and net is the contrast in procedure between property and labor incomes. In property incomes the net part is obtained after all capital outlays have been replaced and is thus a pure surplus. In labor incomes the procedure is quite different. Wage earners or salaried workers consume a part of their capital, viz.

their working capacity, in the process of earning their income; and the replacement of this earning capacity can be accomplished only by consumption at a certain level of subsistence plus provision for complete replacement at the time when working capacity has dwindled to zero. Were we to proceed as in the case of property incomes, we should deduct from wages or salaries the living expenses plus provision for the future and count as net income only the residue, a procedure suggested by some economists (Loria). The actual practise, as is well known, differs materially from that suggested. True, in certain occupations specific professional expenses are deducted from gross revenue in the computation of net income; also the income tax laws, by setting exemption limits and by imposing lower rates on "earned" incomes, recognize that a certain part of labor income is not net. But by and large, in contrast to property revenues, in labor incomes the net is almost equal to the gross revenue received. This implies that the working capacity of individuals cannot be treated as a part of the property system; that therefore an outlay by an individual of his personal activity is a part of his general existence and the income he receives is a fund of subsistence and not a means of perpetuating the individual as a part of society's wealth. Hence distinguishing gross and net income of individuals from labor or personal services is a case of drawing a line between the area of the economic principle and the ways of life at large. As this line is drawn, so are the questions raised solved. For instance, what specific expenses should be allowed in arriving at an individual's net labor income? There is no precise answer, the general basis of determination being the importance to the individual's whole life of the object obtained as a result of expenses. If this importance is great, the outlay, like expenditures on living, cannot be imputed to the income getting activity proper and should not be subtracted. If, however, these expenses are bound up only with the income getting activity, they can and should be deducted. An interesting illustration is provided by the expenses of doctors, lawyers and other professional persons for their offices or tools, the outlays on which are obviously deductible, and for their education, the expenses for which are usually not deducted. Similar questions arise in connection with wage and salary earners in regard to such cases as the differential expenses incurred in order to live in proximity to place of work.

The segregation of the purely economic motives in expenses from the broad drives of human life is a difficult problem whose solution shifts from time to time and country to country. In the United States as in many other countries there is a tendency in the direction of extending the area of expenses allowable for deduction, as the result of a desire on the part of individuals to limit the base of taxable income. The same tendency to regard individuals more and more in the nature of capital is illustrated by the legal cases of compensation for injury. The exclusion of such payments as industrial compensation for injury from net income is inconsistent with the failure to allow for living and conservation expenses; this is also true of the exclusion of net returns (after subtraction of the past contribution of the recipient) from unemployment, sickness and other social types of insurance. For this reason statistical estimates tend to and should include industrial compensation for injury at the same time that they exclude insurance compensation for the destruction of a building by fire.

Since net income from property can be ascertained only by allowing for the restitution of property outlay, a question arises as to what changes in property should be included in income in order to keep property intact. Shifts in the value of property due to general causes may either be accidental in character, i.e. destruction of property by an earthquake or a sudden rise in the value of property which has survived such a calamity, or may stem from general changes in business conditions, usually manifesting themselves through a rise or fall in the general level of prices. Since national income is to be conceived as the end product of economic activity, measured as net addition of commodities and services, changes in property values arising from either of these two groups of causes are to be disregarded. But if the changes in property value are a reflection of changes in the surplus of gross revenue over expenses incurred plus a depreciation charge at secular rates, to include them with the change in such net income would obviously amount to double counting. The same objection would hold if the changes in property value are a reflection not of actual rise or decline in net income but of a forecast income shift. It is therefore only in the cases of changes in property value due to plowing back of income or actual impairment of property that, by definition, there takes place a conversion of income into property or property into income; it is only in such cases

that net income cannot be confined to the surplus of gross revenue over expenses actually incurred plus a standard depreciation charge.

The consideration of the element of realization of changes in property value does not alter these conclusions. If a property has grown in value because of a general change in the level of prices and the property owner sells it, thus realizing a monetary gain, such gains are still to be excluded from national income; and if they are included in the estimate of national income in current money units, they ought to disappear in the deflation of these estimates by a properly constructed index of prices in which the prices of property are included. The consideration of the actual sale of property, however, suggests an additional source of changes in the value of property: an opening up of better marketing opportunities, due to the professional skill of the property sellers. Such changes take place in cases when buying and selling of property become a professional occupation; and in such cases incomes derived from the sale of property, i.e. from the change in the value of property because of the more skilful handling of it in the market, are to be counted as *bona fide* net incomes. But this is only another case of the plowing back into the property of certain currently produced services.

In actual statistical practise the inclusion or exclusion of such changes from net income from property is largely conditioned by the prevailing accounting procedure. For example, in a number of extractive industries the depletion of natural resources actually occurring is insufficiently taken care of by the accounting depletion rates, and in such cases net income as recorded by statistical practise contains large elements of gross income. In other industries deductions from current income for depreciation and obsolescence may exceed appreciably the actual destruction of property in the process of production; and it should be noted that the usual practise of relating depreciation and obsolescence charges to the original cost of equipment means, in the prevailing conditions of technical progress, a conservation of capital not at a constant but at a rising productive capacity. The practise of reporting inventories at cost or market, whichever is lower, means that in years of declining commodity prices the business units understate their net income by deducting losses on inventories. A correction in all such cases is rather difficult; and consequently the distinction between property and income, while theoretic-

cally feasible, is in actual statistical practise a reflection of the distinction made by current accounting procedure.

Of the numerous questions raised above in regard to the contents of national income some can be and have been answered unequivocally by the consensus of learned opinion; others are still in the zone of disputation; and still others, while yielding clear answers on theoretical grounds, fail of application because relevant data are lacking. Elements which are generally included in national income received are: wages, salaries, dividends, interest, net rents and royalties, net money receipts by entrepreneurs and independent providers of personal services—all flowing from legitimate pursuits; also commodity receipts of farmers and other self-contained producers; also the perquisites (such as food and board) of employees and receipts in kind of rent or interest. In order to pass from income realized by individuals to income produced the business savings of the individual and corporate business units and of social units should be added. Items which may still be considered in the doubtful zone are: free incomes to individuals from the business system, pensions, compensation for injury, returns from social insurance, hobby products and returns from incidental services, net services from durable goods used by owners, interest on government loans, the allowance for individuals' deductible expenses and, at a considerable remove, payments to government employees. In some countries, e.g. India, certain estimates exclude payments for all personal services. Finally, for the more deeply going problem of readjusting the market valuations practise lags far behind theory, even in the seemingly simple problem of correcting for changes in the value of the monetary unit.

National income estimates for various countries may differ not only because of the various ways in which the questions concerning doubtful items are answered but also because of differences in the statistical methods employed in arriving at such estimates. These methods vary in their turn because of differences in available data. Such variation is perhaps greatest where the scarcity of statistical materials compels the application of an arbitrarily chosen coefficient to a statistical measure of only a small part of the total universe. Estimating procedures of this type offer no purely statistical problems and are usually unreliable, except when undertaken as an extrapolation based upon a long and extensive series of income estimates for other years

or other areas. Even where statistics cover a substantial proportion of the field, data are rarely available on all types of income yielding activity and do not always provide an undistorted picture of income flow. Estimating methods may be distinguished according to the type of basic data used: production and trade statistics, income statistics and data on consumption and savings.

The commodity-service method attempts to measure national income as the net value of commodities and services produced, tracing them to their originating point in the industrial system. It utilizes the large body of production and trade statistics available in most of the principal countries of the world. Such data permit a comparatively easy discrimination between payments and receipts that represent economic goods and services and those that do not reflect actual creation of new economic goods; for it is the tendency of production and trade statistics to cover only those branches of activity in which the genuinely economic character of the activity is firmly established. Often such figures afford also an approximation to the physical volume of incomes. The disadvantage of this method is the difficulty of guarding against duplications and omissions. In production and trade statistics the full value of a good is usually recorded at each stage of its productive transformation from the point of origin to the sale of the final product. Even when "net value added" is segregated, as is the case in statistics for manufacturing in the United States, a large element of duplication still remains. On the other hand, production and trade statistics are by their very nature better suited for the coverage of commodities than of services and, among commodities, for the measurement of basic materials of uniform quality than of finished goods of varying grades and brands; there is thus the danger of overlooking certain types of income yielding economic activities.

The incomes-received method derives the national total as a sum of net incomes received by individuals and business enterprises. It relies primarily upon the large volume of data gathered by income tax authorities and sometimes upon special studies relating to earnings of various occupational groups and to their family budgets. At least in one country, Australia, data were obtained directly by means of a census. The method of incomes received escapes the danger of duplication; and the resulting total, in so far as it is based largely on incomes of indi-

viduals, is consistent with the concept of national income as it is generally understood in a business economy. The main disadvantage of the method is the deficiency in coverage. All existing taxation systems exempt incomes below a certain range or of a certain type, and many of such non-taxable incomes are not even recorded; in the United States, for instance, more than half of the estimated national income is not reflected in income tax statistics. The deficiency in coverage becomes less important as the exemption area narrows and disappears when an income census is taken. But census taking is an expensive procedure and an income census develops defects of its own; the Australian census of 1915 was shown upon analysis to include a number of petty receipts whose economic nature was uncertain. Even for the recorded incomes, tax (and income census) data do not provide a consistent quantitative picture. The statutory definition of income and the character of data requested vary from country to country and time to time. So does evasion of the tax by complete failure to report or by under-reporting incomes received. Moreover the character and statistical reliability of income tax data are not easily tested; these are available only in the form of summaries published by government bodies, to which they are merely a by-product of administrative activity.

The consumption-savings method, which registers income as it flows out of the individual economy, is used less extensively than the other methods, because it calls for data not generally available. No country has as yet continuous and reliable series on the volume of consumers' expenditures and savings, nor even such approximations as would be provided by data on the volume of retail trade or on consumers' budgets at various income levels. Such figures become available either through a greater development of trade, service and banking statistics, in which case the commodity-service method offers an easier way of arriving at total national income; or through a further study of the activity of individual households, which is both costly and unpractical because of resistance offered to the inquisitive statistician. At present the consumption-savings approach is used as a stop gap when industrial or income statistics are badly lacking; and data are available on individual savings, on apparent consumption of a number of consumers' goods and to some extent on household budgets. In the future, however, this method may come into greater prominence, for it is

increasingly appreciated that a study of the various ways in which income is spent or saved is an essential aid in dealing with a number of pressing economic problems.

There is an obvious relation between the methods described above and national income at one or another stage of its circulation, but the correspondence is one of practical convenience rather than of logical necessity. Since the different stages of national income are closely related, it may be approached at any stage, that of income produced or received or consumed, and the resulting estimate adjusted for the succeeding or preceding stage. Therefore it is theoretically possible to measure the magnitude of income by any of the three methods suggested; the results should check, and such a check is most desirable. Practically, however, the more compelling reason for using more than one method is that because of paucity of data no single type of statistics is sufficient by itself for the purpose of arriving at a reliable national total, unless the investigator gives rein to imagination by employing "raising" or "correction" factors. Estimates utilizing several methods and types of data may be theoretically deficient, because the different constituent parts of the income measure are liable to errors of differing character and hence are not strictly comparable or addible; but the possible error thus involved would be much smaller than that due to a restriction of the estimate to one type of data with consequent extrapolation over a large field.

The allocation of national income by different categories is suggested by the questions formulated above as to the specific contents of the total; it arises in the statistical process of building up the total from estimates of its various component parts; and it is necessitated by the recognition that the mere total is not sufficiently illuminating for any of the purposes served by the concept and measurement. There is an obvious need for a breakdown of a national income estimate when the total refers to an economic system with widely differing regions; when the industrial constituents of the productive system change; when various types of income shift in importance; when the form of economic organization changes; and when the personal shares in the national total are unequal to a varying degree. The main types of allocation are: by economic regions, by industrial sources, by forms of economic organization, by personal distribution according to size of income.

The need for a regional distribution of income totals has already been suggested. The problems raised by such a distribution are similar to those for the national total, but the gravity of some questions is increased in the smaller area units. For incomes conditioned by personal activity of recipients regional allocation may not be difficult, unless there is migration of such recipients across regional boundaries. Much graver problems appear in connection with property incomes. An enterprise may have its plant in one region, sell its products to the country as a whole and pay its dividends and interest to individuals residing in various regions of the country. A regional allocation of property incomes produced or paid out by such an enterprise offers obvious difficulties, problems which have often been discussed by the courts in connection with state taxation of corporations. Up to the present regional allocation of national income has been carried through only to a limited extent. It requires a volume of data not easily available and a clarity of concepts so far not attained in the existing income literature. But the increasing interest in regional similarities and diversities of economic life may lead to a wider employment of such distributions.

The distinction among the industrial sources of national income is important because of differences among these fields of activity in the character of work or life for the people employed; in stability, either secular or cyclical, of net incomes derived from them; in the importance of these industries in the general scale of human wants. Such distributions carried through for one country at successive dates or for various countries at the same date serve to indicate changes in a country's industrial structure over a period of time or structural differences between countries. The distribution presented in Table II for the United States illustrates the type of observation that is facilitated by such statistical measurements.

The dates at which various trends, such as those from agriculture to industry or trade, become observable differ from country to country and occur earlier in older nations, such as the United Kingdom or France, than in newer nations, such as the United States or Australia. Similarly, the exact rate at which shifts in the industrial sources take place in the different countries will vary because of differences in a host of natural and institutional determining factors, such as the availability of natural resources, the class distribution of incomes and

TABLE II

DISTRIBUTION OF NATIONAL INCOME IN THE UNITED STATES BY INDUSTRIAL SOURCES*

YEAR OR PERIOD	TOTAL INCOME (in \$1,000,000)	PERCENTAGES OF TOTAL					
		AGRICULTURE	MINING	MANUFACTURING	TRANSPORTATION AND PUBLIC UTILITIES	SERVICE AND TRADE	GOVERNMENT
1850	2,178.3	35.1	1.1	19.8	19.0	22.0	3.0
1860	3,596.7	30.3	1.7	22.1	20.1	22.4	3.4
1870	6,646.2	26.8	2.2	24.1	11.3	30.2	5.5
1880	7,343.8	20.1	3.0	24.4	12.7	34.1	5.6
1890	11,965.5	18.9	2.7	31.9	10.1	30.8	5.6
1900	17,417.7	21.2	3.4	29.2	9.3	31.6	5.3
1910	29,243.9	23.4	3.3	28.2	9.7	30.9	4.5
1910	29,805.0	19.2	3.2	28.7	10.2	33.9	4.8
1913-17	38,610.0	18.3	3.5	29.8	9.6	33.6	5.2
1913-17	36,652.0	17.2	3.5	28.0	9.4	36.2	5.6
1918-22	58,401.0	16.7	3.4	29.6	10.3	31.7	8.3
1923-27	71,891.0	11.7	3.2	27.8	9.5	40.5	7.2
1930†	72,141.0	8.0	2.3	26.4	10.0	44.3	9.0

* The three divisions of the table represent three different estimates which are not strictly comparable; the degree of disparity between them may be judged from the two sets of figures for 1910 and 1913-17. The first and second parts of the table—the figures for 1850-1910 and for 1910 to 1913-17—represent total income including business savings but excluding government rent and interest and miscellaneous income; the third part—the figures for 1913-17 to 1930—represents realized income exclusive of government rent and interest and miscellaneous income. The figures for 1913-17 to 1923-27 are annual averages for the corresponding five-year periods.

† Preliminary figures.

I., *The National Income and Its Purchasing Power*, National Bureau of Economic Research, Publication no. 15 (New York 1930); an unpublished estimate by the National Bureau of Economic Research of national income for 1930.

the extent of purposive control exercised by society. But with all such differences the decline in the part of agriculture in the nations' end product; the rise, at first rapid and then disappearing, in the relative contribution of mining and manufacturing; and the increase, especially marked in the United States during recent decades, of the share coming from service, trade, finance and government, are tendencies which appear as constituent elements of the growing capitalistic system of production and thus characterize all countries drawn into the path of its evolution. The figures resulting from the allocation of national income by industrial sources are thus measures which afford specific confirmation of the broad tendencies of industrial evolution observed otherwise by historians and economists; or of the broad differences, generally known, in the industrial constitution of various countries. The net contribution of such measurements lies only in refining and checking the generally held notions on these subjects. And when available annually they may aid in the study of the relative stability of income flows from various industrial sources, a problem on which the prevalent generalizations still need considerable testing.

There is a natural tendency to identify the

industrial groupings, which are institutional categories, with the more analytically derived types of economic activity (extractive production, manufacturing production, distributive trading, finance, transportation and so on) and to infer that a shift in the relative importance of a given industrial source, such as personal service, trade and finance, implies an identical shift in the extent of trading, financing and personal service activity. This, however, is not necessarily the case, for with changes or differences in the social division of labor the exact scope of activities subsumed under an identical industrial group may change or differ considerably. The manufacturers of the United States may have been distributing, financing and providing personal service to a greater extent (relatively to their purely manufacturing activity) several decades ago than they are doing now. The increase in the relative contribution to the national total shown by finance, trade and services may therefore be due partly to a shift of financing, distributing and service functions from manufacturing and other activities to a separate professional group. A similar lack of identity between industrial groupings and types of economic activity affects comparisons among various countries. Clearly the difficulty of inferences

from allocations of national income by industrial sources is the greater the more specific such allocations are—even neglecting the fact that carrying industrial distinctions beyond a few major groups runs afoul of the absence of definite criteria as to what constitutes an industry or an industrial group.

It may be said that the general evolution of the industrial system is toward a more intensive division of labor, a greater specialization of functions and hence a closer identity of industrial groupings with types of economic activity; and that consequently the shifts in the relative shares of industrial sources tend to result in overestimation of the shifts in the relative importance of production versus transportation, transportation versus distribution and so forth. But such a general inference neglects two difficulties. The first is the existence of a counteracting tendency of vertical integration which complicates the proper allocation of single economic units; this difficulty may be enhanced by special factors, such as the allowance in the United States of consolidated income tax returns from corporations. In the second place, the difficulty of determining how far the division of labor has gone in the direction of segregating a new industrial division is especially disturbing, the best illustration being provided by the treatment of interest on loaned funds. If a bank receives interest payments on short term credits to a pig iron manufacturer, is this income produced by the banks or by the pig iron industry? The current statistical practise considers such incomes to be produced by the banking industry. But do banks produce the interest received by them on government securities? Are interest payments received by an individual on his railroad bond income produced by the individual or by the railroad? The current practise is to consider these interest payments as income produced or paid out by the government or the railroads, the basis of such decisions being the distinction between professional activity requiring skill and experience, as exemplified in a bank's commercial credit policy, and a non-professional activity of investment requiring no such qualifications. But the carrying through of such a distinction is beset by difficulties. Are the incomes of holding companies, insurance companies, savings banks, investment trusts and similar institutions, whose main source of income is equities in other concerns, to be counted as the product of insurance or the investment industry as such, or are they to be allocated to the industrial

activities which constitute their primary origin? Such questions have arisen but seldom in statistical practise, mainly because of lack of data, but they will have to be faced in the near future.

For all these reasons the apparently precise results of distributions of national income totals by industrial sources must be interpreted with a great deal of caution, being an approximate reflection of only the broadest trends or differences, and need to be supplemented by allocations of the national total based on other criteria.

Forms of economic organization may be distinguished by types of the organized unit (individuals and corporations), by the general principle of organization (free competition, regulation and complete control) or by any of a number of basic elements. No matter how the form of economic organization is defined, the national economy of the last century and of the recent decades represents a combination of branches functioning under different forms of organization. The distinction of the relative importance of the latter on the basis of shares of national income derived from activities organized upon different ruling principles is of considerable significance. But the difficulty of such distinction lies in the contrast between the absolute categories set up by analysis and the absence of such pure forms in reality. One could presumably formulate adequate definitions of free competition or of complete control; but to establish whether or not a given branch of activity is in a state of free competition is difficult, even with access to the internal records of the individual enterprises in the field. On the other hand, when the possibility of a clear distinction is given by formal criteria, e.g. corporate and non-corporate units, such criteria may not correspond to the essential meaning of the distinction. From the point of view of economic analysis the one-man corporations, which formally belong to the corporate field, are by the nature of their operation much more similar to individual businesses than to the giant, anonymous corporate units.

It is this difficulty that largely explains the failure of statistical study of national income to pay proper attention to the allocation by forms of organization. Such a breakdown takes place mostly in so far as it is coincident with allocation by industrial sources, a coincidence that is relevant since the technological differences among industrial divisions form a basic element which underlies differences in form of organization. Thus the estimates presented in Table II permit

one to draw inferences, from the relative growth of such corporation dominated industries as mining, manufacturing, transportation and finance, as to the growing share of national income paid out by corporations; and from the increasing share of government and public utilities in the total to draw inferences as to the growth of controlled areas of our economic system. Further precision in the distribution by forms of organization is at present impossible because of lack of data. But since such breakdowns are especially important in a national economy of a transitional type, when changes in organization are rapid and their effect has to be measured as a basis of economic prognosis or diagnosis, and since recent developments have stimulated changes in the relative areas of various principles of organization, the near future is likely to witness an increasing emphasis upon the allocation of national income by forms of organization.

The distribution of national income by forms of payment is an attempt to go beyond the industrial and organization groupings and to measure the current returns of such general productive factors as labor, capital and land. The significant political and social conflicts that center about the relative share of these productive factors render a quantitative measurement and

test supremely important. An illustration of results obtained by such measurements for the United States is provided in Table III.

The difficulty of obtaining consistent estimates and hence of arriving at definite conclusions is shown in this table by the two sets of ratios for the year 1910. Such inconsistencies make a comparison of the distribution for various countries impossible without a thorough reanalysis of the published data and some rather arbitrary adjustments. But the broad trends in the United States over a period of time, as shown by Table III, can be said to be fairly typical of other industrial countries. Wages and salaries appear to account for a slightly rising proportion of the national total; while entrepreneurial income, which is a combination of wages or salaries, interest on capital invested, rent on land and entrepreneurial profits, claims a markedly declining share of the total. The share of interest and dividends, the segregable elements of pure property incomes, shows considerable stability during the period covered. Rather similar results are revealed for the United Kingdom in the comparison of the years 1880 and 1913 by Bowley and of later years by Colin Clark. The movement of the same shares in the years before the second half of the nineteenth century is subject to conjecture. Some students (Anglo-

TABLE III
DISTRIBUTION OF NATIONAL INCOME IN THE UNITED STATES BY FUNCTIONAL SOURCES*

YEAR	TOTAL INCOME (in \$1,000,000)	PERCENTAGES OF TOTAL					
		SERVICE INCOME			PROPERTY INCOME		
		WAGES AND SALARIES	ENTREPRENEU- RIAL INCOME	TOTAL	RENT	INTEREST AND DIVIDENDS	TOTAL
1850	2,178.3	36.4	44.7	81.1	7.3	11.6	18.9
1860	3,596.7	37.6	39.8	77.4	8.6	14.1	22.7
1870	6,646.2	49.2	31.9	81.1	6.6	12.3	18.9
1880	7,343.8	51.8	21.4	73.2	8.5	18.3	26.8
1890	11,965.5	54.0	24.8	78.8	7.3	13.9	21.2
1900	17,417.7	48.7	30.9	79.6	7.0	13.4	20.4
1910	29,243.9	48.9	28.8	77.7	7.7	14.7	22.4
1910	29,805.0	55.6					
1910	28,297.0	57.5	32.4†	89.9†		10.1	
1913-17	36,652.0	57.5	32.0†	89.5†		10.5	
1918-22	58,401.0	62.9	29.4†	92.3†		7.7	
1923-27	71,891.0	65.5	26.3†	91.8†		8.2	
1928	78,502.0	65.1	24.7†	89.8†		10.2	

* The three divisions of the table represent three different estimates, the degree of disparity between which is indicated by the three sets of figures for 1910. The first and second parts of the table—the figures for 1850-1910 and the second set of figures for 1910—represent total income including business savings but excluding government rent and interest and miscellaneous income; the third part—the figures for 1910-28—represents realized income exclusive of government rent and interest and miscellaneous income. The figures for 1913-17 to 1923-27 are annual averages for the corresponding five-year periods.

† Includes rent.

poulos) suggest that the early half of the nineteenth century was a period of a declining share of labor incomes; and the investigations of the founders of the Marxian school, indicating the same tendency, are well known. But the inferences for these earlier years can be based only upon a piecing together of the most variegated and detailed evidence, since the data do not permit a brief summary such as is provided in national income estimates for later years.

Such summary estimates, however, must be interpreted with the utmost degree of caution, if misleading inferences are to be avoided. Just as in the allocation of national income by industrial sources so also here there is a natural tendency to identify institutionally determined divisions with analytical categories. Wages and salaries tend to be identified with the theoretical category of labor income; and conclusions are often drawn as to the increase in labor's share of the national product from the rising percentage of wages and salaries in the total income. But such an inference is obviously misleading because of: first, the increasing relative weight of industrial branches in which the corporate form of organization predominates (e.g. the share of manufacturing increases while that of agriculture declines); and, secondly, the increasing weight within each industry of the corporate form of organization. As a result of both tendencies the share of labor payments, which has formerly been combined with other functional payments in the mixed category of entrepreneurial incomes, is increasingly segregated and goes to swell the relative weight of wages and salaries. There takes place here the same "purification" of categories that was suggested as occurring in the allocation of national income by industrial sources. The gradual breakdown of individual enterprises serves to increase the identity in the national totals of types of payments with economic functions, just as the intensification of the division of labor serves to raise the conformity of industrial grouping to types of economic activity.

It is for this reason that Table III combines entrepreneurial income with wages and salaries, to yield the estimate of labor and service income. This addition assumes that individual entrepreneurs (i.e. farmers, small traders and professional persons) obtain the bulk of their compensation in payment for their labor functions rather than as a return on capital or as entrepreneurial profits. This assumption granted, it is seen that the relative share of labor and

services (earned income) in the national income of the United States has shown scarcely any increase during the past eighty years. And by the same token similar ratios in any other country for wages and salaries alone tend to underestimate the share of labor and services in the total income at any given moment of time and to reveal a trend in time that is more favorable than closer analysis would show.

Lack of identity between forms of payment actually distinguished and the theoretical categories of economic and social analysis stems not only from the existence of the mixed category of entrepreneurial incomes. Any one institutionally determined form of payment is not a "pure" income category. Thus wages and salaries are defined in economic analysis as a distributive share imputed to the working of a given productive factor, but the payments as registered by the statistician may include quasi-rent and other elements. In the United States salaries as reported by corporations are especially likely to include elements other than labor income, partly because in one-man corporations there is a tendency to report exaggerated salaries in order to reduce the net taxable profits shown, partly because in giant corporations the upper executive personnel wields such powers as to disqualify them from being characterized as employees or their compensation as payment for services. This particular tendency, unlike that of the reduction in the relative weight of entrepreneurial incomes, serves to widen the gap between the institutionally determined types of payment and the economic categories.

To those who conceive of individuals as the active and ultimate units and who do not accept the idea of the economic system as an organic whole it is the income received by every individual that is of importance. National income as a whole retains meaning only in so far as the national distribution by size of personal income shows tendencies toward stable patterns. But from any point of view such a frequency distribution is an indispensable complement of national income estimates if these are to throw any light on the welfare of the nation. Welfare is an actuality only within the experience of every individual and varies materially with the size of a person's income.

The study of personal distribution of income has been rich in attempts at generalization and analytic interpretation. The reason lies partly in the great theoretical interest which attaches

to the whole problem of inequality of incomes as well as in the individualistic slant of theoretical economics after the classical school; and partly in the susceptibility of frequency distribution analysis to statistical generalizations, a property much less characteristic of the time series analyses involved in the other distributions. Thus the past study of this type of breakdown of the national total, unlike that of the other types, has gone beyond a descriptive presentation of results in two directions: first, an attempt to establish a law as to the functional relationship between size of income and number of recipients; and, second, an attempt to summarize the distribution by a single measure of inequality of incomes.

In the first direction the basic point of departure is Pareto's law. This law, in its most dogmatic form, states that the distribution of incomes in the upper (income tax) ranges follows a straight line of the equation $\log N = \log A - \alpha \log x$, where x is income size, N is number of individuals having that income or larger, and A and α are constants to be found from the empirical statistics. Moreover the constant α , the slope of the straight line, is approximately 1.5 in all countries and at all recent times; there is a strong suggestion that not only the upper range of the income distribution but the distribution through its entire length follows the same curve for all countries and at all times; and, because of the unchanging and unchangeable nature of the whole income frequency distribution, economic welfare can be increased only through an increase in the total amount of income.

The importance of such a law for major questions of economic theory and economic policy is obvious, and consequently the attention of economists and statisticians has been directed toward testing its validity. As a result of such cumulative analysis (notably in the United States by F. R. Macaulay) it was established that Pareto's law is quite inadequate as a mathematical generalization; that because of the heterogeneity of the frequency distribution curve, due to the grouping together of incomes from various economic categories, it seems unlikely that any mathematical law describing the entire distribution will ever be formulated with satisfactory results; and, finally, that Pareto's conclusion that economic welfare can be increased only through increased production is based upon erroneous premises. Other attempts to substitute for Pareto's curve a single curve with

another mathematical expression have also been found unsatisfactory as methods of generalization, although recently a French student, R. Gibrat, using a modification of the normal curve of error, has obtained successful descriptions of a large number of frequency distributions of income. The curve employed was of the equation $y = \pi^{-1/2} e^{-z^2}$ with $z = a \log (x - x_0) + b$, where y is the number of income recipients, x is variable size of incomes and $x_0 - x$ is a selected income constant. The assumption in which this equation differs from the normal curve is that the effect of each of the numerous contributory factors is not independent but proportional to the effect of the others.

The more fruitful development in the direction of summarizing the inequality of incomes has yielded numerous measures, which fall easily into four groups: first, those derived from a specific type of mathematical equation and hence contingent upon the goodness of fit of the curve implied by the equation; second, measures of the mean deviation type, available in the statistical theory of frequency distributions and applicable, with varying reliability, to diverse types of distribution; third, measures of mean difference types; and, fourth, measures constructed upon definite theoretical criteria in regard to welfare equivalents of individual incomes.

In the first group three measures of inequality may be mentioned: first, the coefficient α , the slope of the straight line described by Pareto's law, has been employed as a measure of inequality. The steeper the slope, i.e. the larger the numerical value of α , the smaller the inequality. Secondly, there is C. Gini's index of concentration, δ , derived from a different type of curve of the equation $\log N = \delta \log S - \log K$, where N is number of individuals whose income is above a certain size, S is sum of incomes, each greater than the certain size, and δ and K are the constants. In this equation N is a function of the sum of incomes greater than a certain size, rather than, as in Pareto's law, a function of that income size itself. The relationship between Pareto's and Gini's measure is expressed by equation $\delta = \alpha/(\alpha - 1)$. A third measure of inequality may be derived from the curve employed by Gibrat, being equal to $100/a$, where a is the constant in the equation $z = a \log (x - x_0) + b$.

Of the dispersion measures developed in the statistical theory of frequency distributions the average and the standard deviations suggest

themselves as indices of inequality of incomes, both taken relatively to some average income, either the mode, median, arithmetic or geometric mean. The resulting relative measures of dispersion can be computed from a frequency distribution in which the class intervals of income size are taken in absolute figures or in logarithms. The advantage of the latter procedure arises from the fact that the positive skewness characterizing frequency distributions of income is reduced in taking the income variable in terms of logarithms, and that the representativeness both of the central tendency of the distribution and of the average or standard deviation is thereby raised.

The mean difference is computed as an arithmetic average of differences, taken without regard to sign, between all possible pairs of incomes. This measure, called the ratio of concentration by its originator, Gini, stands in definite relation to another, widely known measure of inequality, the Lorenz curve. In the latter cumulative percentages of total income are plotted along the horizontal axis; cumulative percentages of population, from poorest to richest, along the vertical axis; and the points of the curve are the intersections of the abscissae and ordinates thus obtained. In the Lorenz curve an equal distribution is represented by a straight line, equally inclined to both axes; empirical distributions of income usually appear as concave hyperbolae; and the existing inequality is measured by the area between these hyperbolae and the straight line. This area is equal to one half of the ratio of the mean difference to the arithmetic means of incomes.

Measures of inequality based upon functional relation between size of income and economic welfare usually assume that the welfare of different persons is additive; that the relation of income to welfare is the same for all members of the community; and that, for each individual, marginal economic welfare diminishes as income increases. But this last assumption is unfolded differently as preference is given to some specific welfare-income function. Thus according to Daniel Bernoulli the function is described by the equation: $w = dx/x$, where w is welfare and x the size of income. According to Dalton a more realistic hypothesis is expressed by the equation $w = dx/x^2$. According to Cramer (quoted by Alfred Marshall) welfare varies with the square root of income or, making it more general, $w = x^{1/n}$, when n is larger than 1. From each of these functions one can derive an index

of inequality by comparing maximum aggregate welfare with actual aggregate welfare as shown by the empirical sample.

The choice of a measure of inequality may, on theoretical grounds, be based upon the conception of the measure as an index of statistical variability and hence utilize the customary statistical criteria of representativeness; or it may flow from an understanding of the measure as a summary of the welfare equivalents of income distribution and utilize corresponding tests. From the first point of view one tends to look skeptically upon Pareto's α and Gini's δ , based as they are upon curves fitted to cumulated variables; to consider the average and standard deviations as inadequate in themselves, unless taken for an income distribution that does not depart considerably from the normal type; and to consider the mean difference as subject to similar qualifications, in so far as it is shown (by Gini) that the mean difference is equal to the arithmetic mean of deviations from a median, weighted by the number of incomes plus one between the median and the given income. From the second point of view the choice hinges obviously upon an agreement as to the functional relation between welfare and income. But in default of that, the various measures of inequality, which are not based consciously upon a welfare-income relation, may be analyzed for the function which they imply; as a result some narrowing of the field of choice may be attained. Finally, in the selection of inequality measures for empirical application there is the additional factor of the influence of imperfections in data on the precision of the various measures. Those measures that may be best by the criteria of statistical representativeness or theoretical adequacy may be the most susceptible to imperfections of statistical data.

The variety of methods devised to measure inequality of incomes illustrates the profusion of its aspects and suggests a high probability of divergent results from the analysis of one and the same set of data. Considering that this lack of agreement as to the precise aspect of inequality to be studied is accompanied by a comparative paucity of adequate data, one would expect to find few definitely promulgated conclusions as to trends or differences in inequality of incomes. One finds on the contrary a profusion of contradictory generalizations, which are too often obvious results of pressure to respond somehow to a problem so vital to social policy and prognosis. How divergent and withal

CHART I

LORENZ CURVES OF INCOME DISTRIBUTION AMONG INCOME RECIPIENTS, SELECTED COUNTRIES

Scales: Percentage of income recipients, beginning with poorest, is indicated along the horizontal scale; percentage of total income is indicated along the vertical scale.

Source: Based on data derived from the following sources: Prokopovich, S. N., "The Distribution of National Income" in *Economic Journal*, vol. xxxvi (1926) p. 82, and *Narodny dokhod zapadno-evropeyskikh stran* (National income of west European countries) (Moscow 1930) ch. ii, sect. iii; National Bureau of Economic Research, *Income in the United States*, 2 vols. (New York 1921-22) vol. i.

unreliable such inferences are may be illustrated in the case of Prussia, one of the few countries for which data on personal distribution of incomes are available for some years back. From the figures for 1875, 1896, 1913 and 1919 Prokopovich concludes that the inequality of incomes is increasing, thus denying a contrary conclusion by Helfferich that no tendency toward a greater concentration of incomes is observable. From the data for 1896, 1914 and 1926 Angelopoulos infers that the inequality has diminished. And Gibrat, after inspecting the data for Prussia and some other countries, concludes that no definite trend in inequality can be established.

The absence of data as to personal distributions of income for lower income ranges and of data for one and the same country for successive years and the variations from country to country or from year to year in the degree of coverage are but partly revealed in Charts I and II. These assemble some of the various distributions available and give on the whole too favorable an illustration of the kind of data at the disposal of those who attempt to deal inductively with this most important problem. The various studies which have been made, primarily of Austrian, Italian and German data, lead to the

following highly tentative suggestions concerning differences and trends in the inequality of incomes. First, income inequality among income recipients is less conspicuous in agricultural than in other industries, in rural than in urban areas, in smaller cities than in the big urban centers (Austrian and Prussian data—Bresciani, Savorgnan, Prokopovich). But since average income tends to be lower in agricultural and rural areas, the industrialization and urbanization of nations do not in themselves imply increasing inequality of incomes. As for the very difficult international comparisons, one may only suggest that inequality is less conspicuous in younger industrial countries (United States) and in agricultural countries (Denmark, Norway) than in the older industrial states (Prussia, Saxony, United Kingdom). In the second place, income inequality among income recipients is greater in the case of property incomes than it is for labor incomes. If the growth in the number of property owners has not kept pace with the growth of the total number of income recipients, one would infer that income inequality has grown. Thirdly, in those countries in which personal distribution of income has been measured for some time past the preponderance of evidence is toward increasing inequality of incomes among income recipients. This seems to be true for Prussia and Saxony,

for Austria (for the decade before the World War, according to Savorgnan, who, however, qualifies his conclusions by saying that the change may be due to increasing efficiency of income tax authorities) and for Italy (according to Gini and d'Addario). Finally, the inequality of income among income recipients tends to decline during years of depression and to rise during years of business prosperity (Prokopovich, Gibrat).

As one increases the time range and attempts to compare income inequality characteristic of the capitalistic countries of the nineteenth and twentieth centuries with that for countries of precapitalistic times, even the slender foundation provided by the currently available statistical data disappears. Schmoller's suggestion in his communication in 1896 to the International Institute of Statistics that no marked change occurred in income distribution between the fifteenth and the nineteenth centuries is based upon too fragmentary a factual foundation to pass critical inspection. General historical knowledge would lead one to infer that numerically the income inequality must have been smaller in precapitalistic Europe than at present, if only for the reason that incomes were then absolutely lower and that the lower limit of incomes is more rigid than the upper. But this statement as such remains a conjecture, while its analytical interpretation, as to the implied welfare inequality, is all the more uncertain because of marked changes in absolute income, standards of living, organization of society and all other factors that affect the significance of a single aspect like income distribution.

Any analytical inferences, however, even if limited to the recent century and related to the more complete statistical data available at present, are made difficult by three considerations. First, all these studies refer to inequality of income among income recipients only and neglect perforce the number of persons capable and willing to earn incomes but unable to do so because of unemployment, legal limitations and other circumstances. The inclusion of these potential income recipients with zero incomes is likely to change considerably the differences in inequality of income distribution between industrial and agricultural, urban and rural areas; the trends in inequality with the passage of years; and especially the changes in the inequality of income distribution from years of prosperity to years of depression. Thus on the basis of 1918-30 data for the United States Morris A.

Copeland suggests (in a paper presented at the 1932 meeting of the American Statistical Association) that a distribution among the entire population of money incomes, excluding profits from the sale of real estate and securities and other capital gains, tends to become more concentrated in years of depression and less concentrated in years of prosperity—a conclusion exactly opposite to that indicated above for the distribution of incomes among actual income recipients. Secondly, all studies tend to disregard the absolute size of incomes and study only relative inequality, although most of them note the positive correlation in time between size of average income and extent of inequality. But from the point of view of welfare, capital formation or any other analytic implication of a frequency distribution of income the absolute size of incomes involved is of material importance. Income inequality may decline during years of depression, but the welfare inequality may rise materially because of the general lowering of the absolute level of incomes. Similarly, inequality may be more conspicuous in one country than in another, but because of difference in the absolute size of income the capital forming power of the second country may be greater than that of the first; that is, assuming that inequality of distribution stimulates capital formation, a rather doubtful hypothesis. Thirdly, no personal distribution of income takes into account the costs incurred in obtaining the income and the needs it has to satisfy. The importance for any inferences as to welfare, savings, and so forth of establishing a net rather than a gross income distribution is obvious. From this point of view the treatment of labor and property incomes as if they were measured just by the amount received is of course a misleading distortion. And it is clearly important to have frequency distributions of income by families.

These difficulties are but different aspects of the same cardinal obstacle, which has been stressed before in connection with other types of allocation of national income: the disparity between the quantitatively available and measurable groups and the analytically clear cut categories to which they should correspond. It is highly doubtful that this disparity will ever be overcome completely; but progress in this direction will be made through a combination of groups based on more than one principle of division, through the collection of a more extensive body of data and through an evolution of a more definite consensus of scientific opinion

as to the methods of quantitative analysis and their implications. Above all, the recognition of the gap between what can be and is measured and what ought to be measured is a necessary prerequisite of any further progress and a highly valuable antidote to those interpretations, all too common in national income literature, where the wish is the unrecognized father of the thought.

NATIONAL SOCIALISM, GERMAN. The National Socialist movement in Germany is a product of the post-war period. It can be understood only as the result of the dictates of the Treaty of Versailles, involving as it did loss of territory, lowering of military prestige, invasion of the Ruhr and reparation burdens, and bringing in its wake such economic consequences as

inflation, the destruction of the independent middle class, distress among the professional classes and unemployment among the youth.

The words national and socialism had been combined by Friedrich Naumann in the early part of the twentieth century. Naumann's aim was to incorporate the proletarian classes into a democratic state and thus to overcome the Marxian doctrine of class struggle. His partisans, however, never comprised more than a small group of intellectuals, quite different from the great mass following which has come to center around Adolf Hitler. Both the National Socialism of Hitler and the theories of Naumann are at one in regarding the working and agricultural classes as the most important elements in the development of the state. But Hitlerism is more instinctive; it is not based on any rational considerations. Psychologically it is grounded in the pain of the loss of the war and the accompanying phenomena of the German breakdown. The soldier's individual experience of unbounded disillusionment became fixated in a simplified view of post-war history. According to this view Germany was defeated in 1918 not by the superior force of the enemy's men and supplies but by the ill will of certain German groups which, through strikes and uprisings, made victory or the continuation of the struggle impossible. From this interpretation originated such expressions as "dagger thrust from the rear" and "November criminals." The psychological effect of such a representation of historical facts was immeasurable. With the passage of time the influence of this interpretation increased, particularly among the younger people, who came to feel that Germany's unlimited heroic achievements during the war met with defeat at the hands of the internal rather than the external enemy. This internal enemy came to be identified with Marxism, with internationalism, with the pacifist manifestations and aspirations of the Social Democratic party and its adherence to the theory of the class struggle, and with Judaism.

The ideology of National Socialism represents a convergence of several strains in German political and social thought. The writers most frequently mentioned in National Socialist literature are Adam Müller, Houston Stewart Chamberlain, Oswald Spengler and Othmar Spann. From Adam Müller and the romantic movement there has been derived an emotionalist philosophy of irrationalism, an attack on the so-called liberal principles of the French Revolu-

tion and a vague groping toward a corporate and organismic view of the state. This has been reenforced by the neoromanticism of the school of Spann. Spengler, with his attack on liberalism and democracy, his identification of Prussianism with socialism and his heralding of the advent of a new Caesar, has been especially influential among the academic youth. The emphasis on racialism and antisemitism goes back to the influence of writers like Chamberlain, Paul Lagarde and Adolf Stöcker and, in the case of Adolf Hitler himself, to the influence of Karl Lueger. By birth an Austrian, Hitler was influenced in his youth by the anticapitalist and anti-Marxist petty bourgeois antisemitism of Lueger, which regarded both Marxism and capitalism as essentially products of Jewish thought. This antisemitism, at first primarily negative in character, received its ideological elaboration at the hands of National Socialist publicists such as Alfred Rosenberg and Hans Guenther, who placed particular emphasis upon the racial factor and the concept of "Germanic" and Nordic types.

The economic features of the National Socialist program are vague. To Marxism is opposed a "German socialism." The formula of general welfare before individual welfare is more a socio-ethical postulate than a systematic economic formulation. In the early editions of the so-called Twenty-five Points, which represent the official formulation of the National Socialist program and which have been labeled as "immutable," the "liberation from interest bondage" (*Brechung der Zinsknechtschaft*) occupied a prominent place. This is the agitational formula of the monetary theory of Gottfried Feder, which is based on the following simple ideas: the state as the possessor of sovereign power over the issuance of money is not obliged to assume interest obligations for the loans which it floats; it can issue non-interest bearing government certificates to cover the necessary expenditures, whose value will consist in the backing of the state and whose yield will serve to redeem the expended money within a definite period. As the National Socialist movement lost its character as a "sect" this monetary theory, formerly called the hub of the movement, lost its significance and met with opposition even within its own ranks. The attitude toward the system of private capitalism is not clear. Private property and private initiative are recognized, but the nationalization of the great industries and the credit system (the Reichsbank and the

big banks) has been demanded, at least theoretically. Generally speaking the movement is oriented toward a policy of home economy, is mistrustful of international world economy and is favorably disposed toward economic autarchy. There is undoubtedly also a vague anticapitalist spirit, although the more radical proletarian elements under Otto Strasser seceded from the party in 1930 and formed their own organization, now known as the *Schwarze Front*.

The political expression of the National Socialist movement is the National Socialist German Labor party (*Nationalsozialistische Deutsche Arbeiterpartei*, abbreviated as Nazi), the organization of which is direct and hierarchical. The leaders of the various subdivisions of the party are not chosen by the membership but are appointed by the central headquarters. Hitler, despite many difficulties, has succeeded in securing for himself the supreme power over this machine. The *Sturm-Abteilungen* (S. A.) and the *Schutz-Staffeln* (S. S.), originally organized for the protection of party meetings and as guards for the leader, represent the nucleus and most militant elements in the party. Modeled after Mussolini's "black shirts," they are organized in a military fashion, although they have no real military training, and are bound to unconditional obedience to the leader. By the setting up of National Socialist occupational groups and cells in the labor unions and by the creation of a large press and propaganda organization, the party has succeeded in penetrating effectively into the most varied elements of German society. Whereas the membership originally consisted of the proletarianized middle class and of embittered military officers it has, with the increasing distress in agriculture, penetrated into the agrarian districts and absorbed the old agrarian parties. It also enlisted many of the young workers and officials but did not make much headway among the industrial trade unions. It has been particularly successful among young intellectuals, who have been attracted by the nationalist ideology, and its emotional appeal has been largely responsible for its influence among the women.

Officially, the party has always been financed by voluntary contributions. Much revenue has been derived also from admission fees to party meetings, a custom first established by the National Socialists. Naturally these funds could not suffice to pay for such large enterprises as buildings and newspapers. The extent and source of the additional funds cannot, however,

be determined and they have been the subject of many rumors.

The question of the form of government is considered of secondary importance in the movement; republican and monarchist currents exist side by side. It is, however, antidemocratic and above all antiparliamentarian. The laborious, sober and often unsuccessful tasks of the republican Reichstag—the liquidation of the war, the Ruhr invasion and the reparations payments—often led to unpopular measures which were attributed not to general historical conditions but to the "government system." Majority will and compromise were thrust aside and the idea of a "leader" was propagated. Hitler had made a vain attempt to seize power by violence in Munich in the fall of 1923 and thereafter followed the "legal" way which led in 1933 to his assumption of power. He made use of the most rational means to arouse thoroughly irrational forces. By all the instruments of popular democracy he was able to create a mass anti-democratic movement centering around him as the leader. Despite a temporary setback in the Reichstag elections in November, 1932, Hitler was called to the chancellorship on January 30, 1933, and assumed control of the government in a coalition with the Nationalist party led by Alfred Hugenberg. New Reichstag elections on March 5, 1933, gave the coalition the necessary majority and the National Socialist party has since then firmly entrenched itself in control of the country. All opposition has been crushed, the governmental administration has been centralized throughout the land and many points of the party program, particularly those of a racialist character, have been put into effect. It is hardly possible to appraise at this time either the national or the international consequences of the Nazi revolution. The chief problem with which the movement and its leader are faced is to adapt their primitive identification of party, nation and state to the enormous spiritual, religious, economic and regional complexities of German society.

NATIONAL WEALTH. The word wealth has many meanings. It may be used to describe the condition of an individual who has at his disposal, without the necessity of exertion, an abundance of the means of enjoyment. In this sense a country may be called wealthy if its inhabitants are provided with many free gifts of nature. While, however, the possession of the necessities of life without expenditure of effort contributes to the well being of the inhabitants and has great social and cultural importance, it is in principle contradictory to the idea of economic relations, which imply choice between limited goods. Such wealth moreover is not susceptible of measurement and comparison, apart from the fact that there is no standard gauge of enjoyment. On the other hand, the scarcity of many goods relative to the need for them—the situation which gives rise to economic problems—has for centuries raised the question as to how and in what measure a state may amass a stock of goods which are generally valued but limited in supply and which hence constitute a factor of material ascendancy either for the individual owners or for the nation as a whole. Wealth in the form of such an available stock is in the strictest sense an economic factor. And just as the economic process involves the calculation and comparison of goods which are desired but scarce, so wealth in this sense, the result of the economic process, must appear in a calculable form. The basis for such calculability is the market, with its determination of prices and its use of the money system as a general standard of measurement. The expression of the results of the economic process in monetary terms furnishes not only the reason but the presuppositions basic to the inquiry into the existing wealth of an economic system expressed as a total. Closely related to this concept is the idea of the resulting social power or influence of the individual or nation possessing wealth.

It was not by accident that the question of the relative wealth of nations arose in Europe just when feudalism was disappearing and the power of the rising territorial principalities was coming more and more to be based on money revenues needed especially for the payment of soldiers and officials. As taxation became more wide-

spread, greater significance attached to that total fund of moneyed property which served as its source. The ascendancy of mercantilist doctrines moreover led statesmen and economists to stress the importance of a national supply of money and goods. Later the advances in means of communication and the increasing division of labor resulted automatically in the augmented exchangeability of every stock of goods convertible into money—all the more as closer legal and economic relations worked toward an international credit system and permanent participation by one country in the economic affairs of others. For all such international relationships the aggregate of economic goods possessed by any country—expressed in money—becomes an important quantity, a basis of power of tremendous and growing significance. This significance is manifested in the increasing division of nations into creditors and debtors, into entrepreneurs and rentiers, into countries with fluctuating or those with stable financial requirements. Since the World War England and the United States have provided outstanding illustrations of the economic and political influence which a nation may derive from its total monetary wealth. National wealth then in the narrow, accepted sense is the exchange value sum of the total supply of goods of a country expressed as a unit in terms of a general standard of measurement—today, money. For certain purposes it may be merely a summation of actual objects; as a rule, however, the important problem is that of the purchasing power of this supply of goods.

Certain aspects of the concept of national wealth require further elaboration. In the first place it should be stated explicitly that the concept is that of the total of individual possessions; it does not mean publicly owned wealth but rather all economic goods possessed by members of a given nation. The question arises as to whether the possessions of foreigners within the state as well as the foreign possessions of nationals should be included. The idea basic to the concept of national wealth is the extent of the material preponderance a people can exert in the international economic system as a result of its total supply of economic goods. In this respect the property of foreigners within the state plays a variable role. For many nations this will balance more or less with the property of nationals abroad, so that it is possible to ignore the nationality of the owner and merely to calculate the sum of the objects within the country. This, for example, is the method employed by

the United States Bureau of the Census. A distinction between "national wealth" and "wealth within the borders" must, however, be made for countries like Switzerland, in which the preponderance is on the side of property owned by foreigners.

Objects included under national wealth may be either material or immaterial, as, for instance, advantages of position, of productive efficiency or of monopolistic control. The decisive feature is that they can command a price in the market and be converted into monetary terms. Economic goods do not include rights as such; rights are only the forms of such goods. If double counting, however, is to be avoided, even these should be counted into a total representing national wealth only if the tangible items which they represent have not already been included or if corresponding obligations have been considered elsewhere as negative factors. A further point to be noted is that it is logically unsound to maintain that national wealth embraces any classes of objects not regarded as individual wealth. Thus it is inconsistent to hold that ethical goods, such as loyalty, discipline, development, integrity, should be included under national wealth when they would not be counted as individual wealth. When the term wealth is used in the strict economic sense, such goods will not be included in either case. Wealth or national wealth is the sum of economic goods, of price commanding commercial objects, and is conceptually different from and narrower than the sum total of productive or cultural forces. Both concepts are important, for the individual as well as for the nation, but it is illogical to apply the one term wealth to the latter concept in one case and to the former in the other.

A number of authors have denied the validity of the concept of national wealth as it has been set forth here. Some, like von Gottl-Ottlilienfeld, contend that it is meaningless to add together the commercial values existing at any given moment into one total without taking into account the fact that all these goods could never be sold simultaneously and possess any such value. Others, like Spann, argue that the particular character (*Gliedcharakter*) of the individual goods in relation to the whole does not receive adequate expression in such a mere summation. The first objection is in principle applicable to any evaluation of a supply of goods. It can be pointed out in reply that the great mass of value estimates, such as are found, for example, in the balance sheets of industrial enter-

prises and relate to stocks for long periods, are based on the assumption of continuation of regular commercial relations and that only in particular cases is any simultaneous or complete liquidation contemplated. Such estimates are never challenged and express precisely the purpose for which they are drawn up. The same is true of the calculation of the total national wealth of a country, since here too the idea of a general liquidation is essentially irrelevant to the purpose of the concept. In answer to the second argument it may be observed that the particular function of the single objects in the economic units, in manufacturing enterprises, for instance, is generally well reflected in market price. It is the summation of those economic units and not of the individual parts which is important. Real difficulty is introduced into the concept of national wealth by the inclusion within it of factors which lie outside the bounds of economic goods commanding market prices. Indeed it is this misconception which has been responsible for the historical fluctuation in the scope of the concept. The English school of classical economics had a simple clear notion, that of the total sum of exchange goods. John Stuart Mill stated it thus: "Wealth may be defined: all useful or agreeable things, which possess exchangeable value; or in other words, all useful or agreeable things except those which can be obtained in the quantity desired without labor or sacrifice." The idea of the enjoyment of free goods or the possession of non-economic goods, which had already been introduced by H. C. Carey and has persisted to the present, has served to make the concept ambiguous and vague.

As soon, however, as any attempt is made to arrive at a statistical determination of national wealth, it becomes necessary to omit from consideration goods which have no exchange value. The first attempts to calculate national wealth were made in seventeenth century England, chiefly as an outgrowth of English economic rivalry with France and Holland. Thus about 1665 Petty calculated the national wealth as £250,000,000; Gregory King at the beginning of the eighteenth century arrived at the figure of £650,000,000 and fifty years later Hooke set it as £1,000,000,000. These early figures were for the most part based on more or less vague estimates. In the later and more exact studies made in various countries two statistical methods are to be distinguished: the objective and the subjective method. The first proceeds from an inven-

ture of the objects comprising wealth, grouped into different categories—land, buildings, machinery—the figures being derived as completely as possible from valuations current in the various branches of economic life, and the value of each group being arrived at through the use of average prices and added together to form the total. The subjective method derives the total national wealth from a summation of the value of individual possessions, calculated chiefly from taxation statistics.

The particular advantage of the objective method is that it reveals clearly the detailed constitution of the total national wealth, which may be of vital significance for further analysis. Thus, for example, it makes considerable difference whether a large or a small part of the national wealth consists of immovable goods and whether these are of stable or fluctuating commercial value and so forth. On the other hand, an obvious weakness of the objective method is the fact that the estimates of value which it uses must be made by outside statisticians. Under the subjective method, however, the individual owners of wealth or, if necessary, special experts provide the figures. In this way complexes of economic goods which are used as a unit are evaluated according to the significance of the combination and not according to that of the individual parts. Thus the value of the objects in a factory is not expressed merely as the sum of the individual items, but rather as that of a closed unit based on the economic function of the whole enterprise and on its earnings represented by the exchange value of its shares. The major part of the wealth in circulation today is in fact appraised and sold according to its particular place in the economic system, chiefly through a capitalization of average annual earnings. The mere addition of the individual items in a business enterprise would not as a rule yield a value figure nearly as great as that of the enterprise as a whole. On the other hand, extensive aggregation and centralization sometimes result in the decrease in value of the particular items, when their value as separate units is compared with the economic yield of the combination. In either case the subjective method yields the better results, especially where a numerical value is desired and not a record of how wealth is constituted. But aside from its failure to present an objective picture it has a serious weakness in the low valuation deliberately set upon their property by many individuals in their tax declarations, as well as

in the fact that many forms of wealth (public wealth, tax exempt consumption goods) do not allow for a declaration of value by the direct participants. In such cases the subjective method must be supplemented by the objective or by additional sums calculated and added.

Statisticians at first generally used the objective method. More recent work based on this method is that of Fellner for Hungary, Steinmann-Bucher for Germany, Gini for Italy, Théry and others for France and, with certain reservations, the publications of the United States Census Bureau. The census method, with its periodic counting of the population, sets up a definite framework of categories of goods into which the national wealth is divided. In the valuation of the individual categories, however, it relies as far as possible on the information from tax statistics, although it arrives at a more refined estimate of value by the use of a local and well oriented staff of appraisers. In this way the advantages of both methods are combined, up to a certain point. Since the United States Bureau of the Census estimates are restricted to private wealth, the Federal Trade Commission began in 1922 an attempt to complement this by an appraisal of public wealth, which had not been entirely completed by 1933.

The pioneers in the utilization of the subjective method were Adolf Wagner for Germany, Giffen, Chiozza Money and Josiah Stamp for England and de Foville for France. Helfferich made an estimate of the German national wealth in 1911, which he based on tax reports and various other materials. As a test of this estimate he also calculated the national wealth on the basis of fire insurance policies supplemented by additional figures reached by use of the objective method. The difference between the two estimates was 50,000,000,000 marks and the arithmetical mean of the two, 310,000,000,000 marks.

The results of a few of the more recent estimates are worth mentioning. Théry estimated the private wealth of France in 1912 at 302,517,000,000 francs; Gini set the Italian private wealth in 1914 at 110,000,000,000 lire. The private wealth of England for 1912 was set at £16,470,000,000 by Crammond and for 1914 at £14,319,000,000 by Stamp. The United States Bureau of the Census estimate for 1900 was \$88,500,000,000; for 1912, \$186,300,000,000; and for 1922, \$320,800,000,000. (For further statistical information see the article by W. Winkler on "Volksvermögen" in *Handwörterbuch der*

Staatswissenschaften, vol. viii, 4th ed. Jena 1928, p. 770-86.)

A figure representing the total sum of material objects can be constructed by a but slightly variable inventory process. For the determination of valuation figures, however, there are a variety of methods, the choice depending largely on what materials for appraisal are available. In countries with well developed systems of property taxation this material is the primary source for information as to personal fortunes. The degree of accuracy of the results depends of course on the inclusiveness of the taxation and on the severity with which it is enforced. Another valuable source is the income tax based on a schedule system, as in England; as this material has been used by Giffen among others, those income groups which represent earnings on wealth are segregated and the incomes capitalized. Since there are many objects of wealth, either private or public, which yield no monetary return, either of these methods requires supplementation. An interesting method, based primarily on the French taxation system, is that developed by de Foville. His investigation rested on the idea that the entire private wealth of a country is transferred by inheritance during the course of one generation. He derived the total value of such wealth by calculating the average amount of annual transfer of inherited wealth and multiplying this by the number of years in a generation. To this sum he then added figures for non-private wealth derived in other ways. The danger of the method lies chiefly in the difficulty of making an accurate estimate of the average number of years through which a heritage survives the individual who bequeathed it. Moreover allowances should rightly be made for differences as between different social groups. More recent methods based on the ideas of de Foville are even more subject to the charge of resting on a narrow basis.

The scientific justification and significance of attempts to estimate national wealth in monetary terms are not negated by the very real difficulties of the problem. The same may be said of international and periodic comparisons of national wealth, although these present even greater limitations and disparities. Thus, for instance, one nation may have to expend huge sums to acquire certain consumption goods which in another land are obtained either completely or in part without cost, such as warmth in southern countries. In any comparisons of national wealth there must also be taken into

account the fact that some of the values of the items comprising the total rest on narrow and others on broad market bases, as, for example, certain kinds of art objects at one end of the scale and grain at the other. Fashion and business cycles also give differential significance to totals. All such differences can be subsumed under the term market disparity. Differences in the valuation of similar objects in separate local markets are due largely to differences in individual purchasing power. There is one more factor of the greatest moment: the psychological attitude of a people determines, to a far greater degree than is generally supposed, which goods shall be brought within the bounds of the price system. In this respect modern capitalism is much more sensitive and far reaching than, for example, the mediaeval handicraft system. It might even be said that the commercial-capitalist outlook creates values out of dust. Differences in intensity of economic activity and thought result in the greatest differences in the extent to which values are expressed in monetary terms and therefore also in what is included in the sum of national wealth. Comparisons between different countries as well as between different periods are affected by this fact. It is easy enough to conclude that values once represented solid wealth but now stand only for shaky or even completely fraudulent structures. But this is not true, for there is a tendency in the general course of economic development for new objects continually to be drawn into the sphere of market transactions and price valuation and consequently for the bases of calculable wealth to shift and change. Despite all difficulties of definition and calculation, however, the importance of the concept of national wealth for an analysis of the economic and social position of different nations is likely to increase rather than to decrease.

NATIONALISM

THEORETICAL ASPECTS. Nationalism in its broader meaning refers to the attitude which ascribes to national individuality a high place in the hierarchy of values. In this sense it is a natural and indispensable condition and accompanying phenomenon of all national movements. In so far as the political life of the national state is governed by national forces there is hardly ever any sharp distinction between patriotism and nationalism. On the other hand, the term nationalism also connotes a tendency to place a particularly excessive, exaggerated and exclusive emphasis on the value of the nation at

the expense of other values, which leads to a vain and importunate overestimation of one's own nation and thus to a detraction of others. Nationalism of this sort stands in the same relation to national feeling or national consciousness as does chauvinism to genuine patriotism. Although it represents but one aspect of national movements, this narrower kind of nationalism, espoused by militant groups and often by mass parties, exercises an enormous political influence.

The concepts nation and nationality have been subject to two interpretations. According to one interpretation the tendency in national development has been to efface the boundaries between nation and state so that at a certain stage in democratic development states automatically become transformed into nations. Nationality thus implies the formal adherence of an individual to the state. Polish nationality, in this sense, includes all the subjects or citizens of the Polish state irrespective of the language they speak or the ethnic group to which they belong. Concretely the term nationality is here used to designate an undeveloped and non-independent national group which has not yet attained to national sovereignty. Nationalism therefore represents the tendency of the subject national group to achieve independence or, in the case of an already existing national state, to increase as far as possible the prestige and consciousness of power of the dominant nationality. Hence nationalism and the national movement appear as a continuation of the democratic movement which after achieving the elimination of all privileges and differentiations, of every form of aristocracy within its own midst, then sets up its own nation as against the outside world. Nationalism of this sort assumes an emotional character which easily becomes aggressive, thrives on the negation of other alien peoples and ethnic groups and rises to extreme forms of passionate hostility to all foreign manifestations. Although this type of nationalism has its origin in intellectual circles, it achieves its actual force and significance through its appeal to mass instincts.

In contrast to this political concept of nation and nationality there is the view of the nation as a more ethnic and cultural phenomenon. Differences in language and culture as well as variations in religion, race and customs result in the formation of social groups which, independent of political boundaries, constitute fundamental national units. Nationality thus signifies ad-

herence to a people rather than to a state. Whereas according to the political concept of nationality there is a definite Swiss nationality based on membership in the Swiss state, according to the other view every Swiss individual is of the German, French or Italian nationality, depending on his cultural and ethnic affiliations. Nationality in the concrete sense thus refers to a people or a group which, independent of its political aims, forms a totality relatively wider and more comprehensive in character. Thus the Ukrainian nationality in Poland includes all the Ukrainians in Poland and the Polish nationality in Europe all the Poles in Europe. It follows that not every modern state is to be identified with a nation, as implied in such an expression as League of Nations. The national state must be looked upon only as a particular form of political organization representing a synthesis of nation and state. There is no clear and unanimous opinion as to the exact nature of this synthesis. By some it is viewed as a complete identity of the territory of the nation with its political jurisdiction. A state which has not yet united with it all its co-nationals (e.g. the pre-war Italian *irredenta*) thus falls short of this ideal. A state of this kind should, however, be forbidden to possess jurisdiction over alien minorities or colonies (e.g. post-war Italy). In a similar sense the term national state may be applied to a state which pursues a policy of irredentism and assimilation of its foreign minorities. In this sense Italy has exhibited the characteristics of a national state both before and after the World War. A national state moreover is conceived to be a symbol and form of expression of the peculiarity of a particular people, having as its special mission the realization in history of all its predispositions and ambitions. Despite the fusion of nation and state in these conceptions, the distinction between the two is fundamental to the original idea of nationality. The absolutist dynastic state represented a type which was in no way legitimized by the idea of nation or nationality. There are, on the other hand, forms of nations, of smaller or larger magnitude and of greater or lesser development, which lack completely any political unity or form. Pure state and pure nationality represent the limits between which are realized specific syntheses of people and state in the form of national state, nation and nationality.

National feeling arises and becomes intensified as a result of a twofold process of isolation and contrast with respect to the outside world

and cohesion and drawing together within. The result is not only the demarcation of one nation from another but also, as regards the individual, a struggle between the group consciousness of the nation and that of the church or other social groups. In this struggle the national ideal asserts itself as the bearer of a principle of solidarity *sui generis* against all other forms of group consciousness. The emergence into consciousness of unconscious evaluations through contrast and emphasis of appeal becomes a dynamic factor of first magnitude in times of political instability and transmutation of values. Under the stress of such conditions the principle of nationalism penetrates into spheres which normally are beyond the scope of national differentiation, such as those of absolute religious belief, or else it must defend itself against the encroachment of religious, economic or political interests upon the legitimate realm of national being. The continued existence of nations depends too not only on their physical growth but also on their self-assertion in the world of nations around them. They may increase through assimilation and infusion of alien national elements as well as by accretion of their own national powers. Their decay and disappearance likewise come about not only in the form of physical extinction but also through relative loss in world prestige and importance, through alienation of elements within their own national groups, through emancipation of particular separatist groups or, finally, through the dissolution of the national entity into independent nations, as, for example, in the decline of the Roman Empire through the emergence of the Romanic nations.

National character is one of the most significant factors in the more precise and pronounced elaboration of modern nationalism. The rather uncritical assumption that peoples have a common character and that national characterization is therefore possible is very old and ineradicable. Scientific travelers, historians, poets, members of military expeditions and tourists have always attempted to present their impressions of foreign countries and foreign peoples as descriptions of national character. Genetic explanations of these national characters thus precede critical reflection as to whether and how far the hypothesis of the existence of national character is at all tenable. On the other hand, those who criticize the acceptance of the idea of national character have also not distinguished clearly enough between the various aspects of the problem: whether clear and un-

mistakable characterizations of nations are possible or whether perhaps in the theoretical and practical relations between nations there is a presupposition of national character although it can never be exactly determined. That there is at least a relative uniformity and constancy in the attitude of a nation is hardly to be doubted. The determination of national character in this sense, however, is rendered more difficult by the fact that there are also common attitudes characteristic of an age as well as of groups and individuals; national character is thus but a partial factor which cannot be isolated for observation and description. A particular difficulty in ascertaining and determining national character arises out of the fact that it is applied not to the average but to the typical, and in a wide sense to the ideally typical, attitudes of a people. It is therefore dependent on the social relations of the period particularly with regard to the domination of one or another social group within the nation.

The question of the immutability of national character which has been so passionately affirmed and denied is in great part a mere exercise in terminology. Socially dominant characteristics of a people are historically mutable and the historical identity of a people is not destroyed by such change. A complete constancy of national character therefore can hardly be maintained. Single characteristics of a people, however, often show extraordinary powers of survival and self-assertion. But it would be a *petitio principii* to consider that only these factors make up the completely immutable national character. An exact determination of national character would then be impossible, for its constancy would have to extend not only into the past but also into the future, so that the "proofs" would be in the nature of prophecy as well as of historical analysis.

In its wider aspects the question of the permanence of national character is linked up with attempts to explain it. Those who adhere most closely to the theory of the permanence of national character attempt to make race or blood mixture the determining factor. They hold that all changes in the racial basis of a people, such as those brought about by the absorption of an alien racial element in colonial possessions, would result in a corresponding alteration of national character. Considerations of this sort are also basic to antisemitism in many European countries and to the movement against the infusion of alien racial elements in North America.

There is, on the other hand, an explanation of the peculiarity of race and, above all, of national character which proceeds from more or less variable environmental influences. Climate, stressed in antiquity by Hippocrates, Galen, Strabo, Vitruvius and Cicero, was taken up by Montesquieu and Herder during the era of Enlightenment as an explanation of national character. Other theories which interpret national character as variable and as an outgrowth of historical conditions emphasize the habitudes which arise from political, religious, social and economic situations.

The idea of national spirit or national genius in Montesquieu's writings and in the French Enlightenment and of *Volksgeist* in the works of Herder, the German romanticists and of Hegel has a certain affinity with the idea of national character. The German writers particularly view the *Volksgeist* as a metaphysical hypostatization whereby the history and culture of a people can be traced to one common root. Whereas the idea of national character has been of greater influence on the emotional relations between peoples, the doctrine of *Volksgeist* has proved to be very fruitful in philosophy and in the social sciences and has aided in bringing about a greater mutual understanding between peoples. This influence, however, has pervaded only the intellectual classes and has been without any practical political consequences. Through Hegel the concept of *Volksgeist* was diverted into étatism and moreover, by being made to correspond to his dialectical system, was robbed of its richness and vitality. During the course of the nineteenth century the theory of *Volksgeist* was more and more discredited by empirical skepticism. Less precise concepts, such as "French spirit" or "the genius of the Roman Law," came into use and the idea of the character of an epoch came to displace that of national character.

Theorists of nationalism have ascribed great significance to the factor of territory and territorial conditions. The mystical element of the association of earth with the cult of the dead has been particularly strongly emphasized in the more recent French nationalism represented by Barrès. The belief in absolute autochthony or relatively earlier settlement within a given territory and the idea of original settlement still play an enormous role in the struggles between nationalities. Such arguments are brought forward in justification of the revolutionary agrarian measures in eastern central Europe. Love

of homeland is an ethical concept fundamental to all nationalism. In regions of mixed nationality, however, this idea may serve as a unifying element for rival nationalities and also as a check on the development of a conscious and too ardent nationalism. There is thus both a sympathetic and an antagonistic relationship between nationalism and regionalism, in so far as the latter represents more than the mere yearning of an uprooted urban population for its native home. A healthy nationalism makes use of this feeling of local attachment and finds in it an effective counterpoise, for it is conducive to nationalism of a defensive and intensive rather than of an aggressive and extensive nature. On the other hand, because of their tendencies toward decentralization, their emphasis upon cultural factors and a certain type of pacifism, regionalist or federalist currents are looked upon with suspicion by the political nationalist movements of the great states. Indeed the restriction of national feeling to a local region may lead to eventual dissolution of the greater national unity.

The national frontier, or border region, is the symbol of the territorial contiguity of nations and thus a particularly vital factor in modern nationalism. A linear border is said to exist where the territories of the individual nations touch each other; often the mutual pressure is so great that this border acquires a dynamic character. A border zone is a region where the settlements and spheres of influence of the peoples are so intermingled that the boundaries separating the nationalities are identical with the barriers of religion and social groupings. In such a common territory the only actual boundaries are those set by the social relationship of the nationalities. Border populations are usually imbued with a particularly militant nationalism, for here the contrast to an alien people and an alien culture is more generally apparent. At the same time, however, it is practically possible in such regions for individuals, families and groups to change their nationality. Through widespread bilingualism as well as through intermarriage and other manifestations of binational life an individual may easily drift into that hazy transition stage of nationality which is but a step from becoming a renegade. These may, on the other hand, lead also to an overemphasis of national antagonism. This "pathos of the border regions" is the connecting link between the border regions and the capital city of a country. For the capital, as the focal point for all the vital energies

of a people, is also the rallying point of its expansive forces. A threat to the safety of the border is thus looked upon as a menace to the whole nation. The chief nerve centers of nationalism are therefore the border regions and the central region. The intervening districts are less affected by nationalism.

Nation and territory are brought into contact not only by the static phenomena of settlement but also through the dynamic factor of population movements. The territory of a nation may be altered radically through movements of populations, as in the case of the great migrations, or it may increase or shrink through emigration or colonization. The result of such proceedings is the conversion of nationally homogeneous territories into mixed regions in which the relations between the rival nationalities as well as their numbers will be subject to change in accordance with their power, culture and economic influence. Just such regions, however, which often become the battle grounds of century long national struggles, assume particular importance for the nationalism of the peoples concerned, for they come to serve as barometers of their national prestige.

National cohesion of widely scattered regions and populations and protection against national particularism and disruption, as in the case of the Spanish colonial empire in South America, depend on numerous factors including profound and many sided relationships firmly rooted in tradition. Together with the development of such immanent tendencies as economic intercourse, nationalism also develops a sort of territorial symbolism conducive to what may be called a secularized form of pilgrimage. This nationalist symbolism has a distinctly historical character and serves to intensify the group solidarity by the revival of national traditions. The objects of such pilgrimages are sites of important incidents in national history—battlefields, places of birth or death of national heroes and ruins. The transference of this symbolic significance to geographical districts which are also scenically attractive, as, for example, the Rhine for romantic Germany during the nineteenth century, is merely a secondary and relatively insignificant accompanying phenomenon. It is not the most beautiful section of the Alps which comes to possess the greatest symbolical significance for German nationalism but rather the south Tyrol, which is historically and ethnographically most significant for the German national consciousness. Any restricted region,

in particular one's own native birthplace, may thus come to represent the wider national symbol. The more circumscribed homeland toward which the yearning of the uprooted is directed becomes in the basic nationalist experience the particular territorial symbol of the fatherland or the national territory as a whole. This gives rise to a close connection between nationalism and regionalism in contrast to the centralistic tendencies of a purely political nationalism.

Perhaps the most important factor in modern nationalism is language. The concept of a mother tongue has made language the source from which springs all intellectual and spiritual existence. The mother tongue represents the most suitable expression of spiritual individuality. The development of philology since the middle of the eighteenth century cannot be understood without this basic supposition according to which language is represented as the key to the most essential characteristics of a people and its culture. A people not only transmits the store of all its memories through the vocabulary of its language, but in syntax, word sound and rhythm it finds the most faithful expression of its temperament and general emotional life. The rare cases wherein a people has retained its individuality despite the loss of its language do not disprove the conviction of a people or national group that they are defending in language the very corner stone of their national existence. The encouragement of dialect is somewhat analogous to the regionalist cult of the local homeland. Its exaggeration leads to a dissolution of the nation into smaller component parts, which may remain independent for a longer or shorter period and thus jeopardize the greater national idea. The development of a linguistic particularism, such as the Afrikaans as opposed to the Dutch, the American to the English, the Pennsylvania Dutch or Luxemburgian to High German, is a symptom which reveals, even outside the realm of language, divisions and separations from earlier and more comprehensive social groups.

Language is particularly important for nationalism in that it is the object of social and political conflict. This language conflict cannot be explained as a rational phenomenon regulated by practical utilitarian considerations. Where such considerations do predominate, the basic nationalist suppositions are absent and very few serious clashes result. Essentially these conflicts spring from national pride, honor and prestige

as well as from tendencies toward national survival and expansion. The conflict is usually concerned with the public use and official toleration of the language in the church, in legal affairs and administration, in intercourse and in economic relations. Further it is concerned with the possibility of propagating the language through schools, organizations, clubs and other institutions and of defending it against attempts to suppress and supplant it. Here too, in addition to the kind of nationalism which defends its language as the central symbol of national life, there is also an aggressive nationalism which seeks to suppress other languages and to disseminate and exalt its own.

Names represent a phase of language especially emphasized by nationalism. There are regions of mixed nationalities in which there are two rival sets of names for cities, rivers, mountains and the like. The use or disuse of one or the other leads to the growth of definite national claims, of either a cultural or political character, which assume a popular symbolical significance. The national affiliation of individuals or families is often indicated by their choice of first names or by their modification of surnames either voluntarily or by compulsion. Nationalism thus develops a definite moral code whereby individuals, officials and the state are constrained to give theoretical or practical recognition to the national relevance of names.

Closely related to language is the script. Among civilized nations there are many more languages and peoples than there are scripts. But the contest between the Latin and the Gothic script in Germany and between the Latin and the Cyrillic script in some of the eastern and southern Slav countries has taken on a nationalist character. The Irish have given expression to their national emancipation from the Anglo-Saxons by the revival of their ancient script. On the other hand, nationalism in modern Turkey has led to the abolition of the Arabic script. Among some of the smaller east European nations—the Czechs, the Latvians, the Estonians—the transition from the Gothic to the Latin script was a definitely nationalist act, a protest against the German influence which had hitherto prevailed.

The dominant position of language in national conflicts arises from its utter incompatibility. There are few practical possibilities of using several languages simultaneously or of mixing their elements. People are thus more constrained to make a decision in the case of language than

in matters of custom, gesture or thought. Above all language is the material basis of all higher forms of cultural and spiritual life and of the science and literature of a people. It undoubtedly represents the strongest and most significant bond which unites the various cultural expressions of a people.

Another important and highly volatile factor in modern nationalism is religion. Under primitive conditions an intimate connection between national or tribal religion and the consciousness of solidarity of the given ethnic group is both possible and normal. In fact the primitive forms of nationalism may be understood as religious phenomena. In the nationalism of the more civilized peoples of the world the problem is determined by the strong tension which arises between a religion to which is ascribed a fundamentally universal, supranational and absolute character and the quasi-religious emotional atmosphere of a particular nation. Generally it may be said that a form of religious life which is rigidly bound by dogmas and ecclesiastical institutions is an obstacle to the expansion of religion into other fields of activity. A formless and less authoritarian Christianity offers greater possibilities of development to syncretism and also to adulteration by nationalism.

A closer analysis, however, reveals that in the legitimate sphere of the Christian religion and even more in Judaism and Islam there is a starting point for nationalism. It is only the dogma or the objective creed of the religion which is strictly supranational. The fulfilment of the religious spirit in the cult of the church community or in the inner life of the individual undoubtedly allows for differentiation in the national religion. The great difference, for example, between Catholics and Protestants with regard to the significance of the mother tongue (despite the occasional concessions of the church to Ukrainian and Armenian Uniates) now begins to disappear as the Catholic church no longer attempts to bar national influences from the religious service. In the question of religious instruction in the mother tongue Catholicism represents theoretically and also in practise an attitude which can be thoroughly harmonized with a moderate form of nationalism. On the other hand, it is just this confessional variation within Christianity which is very important for nationalism, since the national opposition is raised likewise into a transnational and absolute sphere and evinces a tendency to fanaticism. Such possibilities are always present where na-

tional and confessional opposition appear simultaneously within any sort of complex of peoples. Particularly in the past, as, for example, in the Anglo-Irish antagonism or the German-Czech opposition during the Hussite period, it is not easy even for the historian to distinguish clearly between the religious and the national elements. Religious proselytizing in the Balkans inspired by Russia during the first half of the nineteenth century was designed to pave the way for the nationalist activities of pan-Slavism. Whereas the antisemitism of the Middle Ages was grounded on a religious basis and was appeased by the conversion of the Jews, the racial or nationalistic antisemitism of today passionately opposes change of faith as mimicry.

When Christianity sought to wipe out the existing religions of the pagan tribes and peoples it merely forced these strong religious energies into a secondary channel of apocryphal religiosity and so-called superstition. Actually these peoples never completely surrendered their need to ground their national consciousness in religion. Military oaths, presentation of colors, field services or religious services on national memorial days are but illustrations of a concrete and far reaching connection between nationality and religious life even among the Christian nations. The complex and deeply rooted relationship between nationalism and the church is exemplified among the Poles, the Flemings and the Irish. General Foch, at the close of the World War, placed his sword on the altar of the Virgin Mother of Lourdes; and the canonization of Joan of Arc by the Catholic church lent strong support to French nationalism. Religion and nationalism are even more closely connected among Greek orthodox nations, like the Serbs, who revere as saints most of their national heroes and dynasties.

Very often the more orthodox elements in Christianity take a stand against this intermixture of the religious and national spheres and withdraw into the narrower sphere of pure religion. Thus the atheistic Catholicism propagated by Charles Maurras and the Action Française was no longer tolerated by the church even though this movement supported Catholic interests in lay France. German Catholicism has always remained aloof from nationalism. A corresponding attitude is also developing today in German Protestantism, especially as a reaction against the encroachment upon the Protestant churches by the National Socialist movement. This has resulted in the develop-

ment of sectarian communities, some of which have taken a position of sharp opposition to Christianity and have sought to arouse and stimulate a national religion out of the elements of the old mythical religions. An extreme example is the *Tannenbergbund* of Erich and Mathilde Ludendorff in Germany.

Stronger perhaps than these conscious and institutional connections are the unconscious and indirect relations which exist between religion and nationalism. The whole emotional realm of piety, which occupies such an important place in nationalism, is thoroughly impregnated with a religious strain. Ancestral reverence, the respect for the institution of the family, the adoration of national heroes and particularly of national martyrs, the readiness to self-sacrifice for the nation, the traditionalism which clings to morals and customs and defends them against the leveling influences of world civilization—all these are manifestations of an attitude which is both ethical and religious. This is equally true of the idea of a national mission. The *Gesta Dei per francos* represent an early example of French nationalism; and the great Russian novelist Dostoevsky declared that every people must consider itself the "God bearing people" in order to have any faith in its future. The chiliastic expectations which nourish nationalism and wipe out the distinctions between the political leader and the savior of the masses reveal clearly the extent to which religious forces have penetrated national feeling.

In the nineteenth century the idea became dominant that the natural goal of every national movement is the creation, maintenance and increase in power of a national state. Only a few decades ago this "principle of nationality," propagated by Mazzini and later by Napoleon III, demanding that political and national boundaries be made to correspond, was a subject of great controversy in political philosophy and jurisprudence. The principle has since gained such wide influence that Wilson's program of "self-determination of peoples" in Europe was interpreted and utilized as a license for the most unrestrained kind of nationalism at the expense of the defeated nations. The explanation for this one-sided exaggeration of the political aspect of nationalism is to be found above all in the fact that the legitimist-dynastic principle as the constitutive factor of the life of the state was undermined by the individualism and skepticism of the Enlightenment. Its place was taken by the principle of popular sovereignty, out of

which developed the modern national democracy which embodied the political will to carry through the principle of nationality. Its foreign policy is irredentist and its domestic policy assimilationist. It denies the sovereignty of the state over the people and affirms the sovereignty of the people as the nation in the state. Until the present it has largely combined the idea of a centralized state with an individualistic concept of the nation, interpreted as based on the decisions of the individuals (the principle of subjectivity) or, in the classic words of Renan, as a *plébiscite de tous les jours*. The integrating factor, previously consisting of loyalty to the ruling house, was now replaced by nationalism. The present day trend from liberal representative democracy to dictatorial plebiscitary Fascism has led only to an intensification of nationalism. The subjection which results from wars, rendering more difficult the correction of frontiers, misplaces the emphasis of actual conditions upon the opposition between a policy of political assimilation and national revolutionary, ultimately revolutionary, opposition of the national minorities. An attempt to combat these irredentist movements by organic counter measures along the lines of cultural and territorial autonomy is not at present being undertaken by national states. The unitary and centralized form of state which is dominant today is by nature hostile to the concepts of federalism and autonomy.

The appeal to the individual for conscious solidarity with the group is made through the most extensive use of propaganda. For the most part it arouses the energies and dispositions which are latent in all human beings. The spiritual and intellectual needs of man as well as his emotional and instinctive powers are canalized through nationalism. Since the latter are most decisive for nationalism and its expression in collective action, the individual should be reached when his critical powers are either undeveloped or in abeyance. For this reason nationalist propaganda concentrates upon the young and the masses.

Nationalist propaganda commences with the youngest children. It is most potent when it enlists the support of family, school and society. One of the most effective methods of French *revanche* propaganda in pre-war Alsace-Lorraine was the wholesale importation and distribution of nationalist toys (French tin soldiers, flags, trumpets). Planned attempts toward assimilation through kindergartens (*salles d'asile*) were undertaken by the French under the auspices of

the empress Eugénie. Fascism in particular makes use of open nationalist propaganda for children, as in the Ballila. Among the great youth organizations which serve the cause of nationalism that of the Boy Scouts is internationally the most widespread. Military sports are today organized either directly or indirectly by the armies. Their most recent development aims definitely at a militarization of the nationalist youth propaganda. Strong currents within the youth organizations reenforce the movements fostered by adults and by organs of the state.

While the nationalist youth propaganda increases national consciousness and in many ways makes it also more fanatical within concentrated areas, the contest over the mind of the child in nationally mixed regions is greatly intensified both in attitude and in method. Not infrequently it is found that each national party looks upon the other as the aggressor and attacks the other's "nationalism." For itself it claims merely a normal national consciousness. The modern doctrine of the omnipotence of the state, which since the French Revolution has gained in ascendancy far beyond the confines of the European continent, gives the state and therefore the dominant national group such an overwhelming supply of instruments of power in the field of education that the oppressed national minorities are reduced to a hopelessly defensive position, especially as regards primary education. Their only means of defense against the positive right of the state are natural law, the Catholic position as regards the rights of parents, the right of private instruction and such other remains of liberal and corporate institutions as are still preserved. Cultural autonomy, as realized in Estonia, represents an attempt to secure for the minorities by constitutional means a corporate development of their nationality with the assistance of the state. Opposed to these demands are the ever present assimilationist tendencies in the government schools and in the youth organizations favored by the government.

The organization of the youth constitutes but a small part of a more comprehensive system of nationalist organization which finds expression in societies, clubs, orders, parties and the like. A survey of the organizational development of European nationalism in the nineteenth and twentieth centuries reveals a great abundance of these types of organization. Once its goal has been attained, nationalism becomes inseparably united with the state and all its institutions; while it becomes the guiding force of all the

organizations and societies of nationalities which have not yet arrived. Very often a harmless functional purpose serves to conceal the nationalist intent. Among the smaller nations and particularly among the Slavs of east central Europe the nationalist development of the last hundred years has ranged from predominantly academic and literary associations, sport societies and popular libraries through economic cooperative organizations (consumers' cooperatives, savings banks, scholarship funds and so on) to definite political parties and secret committees which have been instrumental in attaining political independence.

The press is an extremely important auxiliary for nationalist propaganda. It serves to solidify the national consciousness and to diffuse the nationalist ideology in the form of slogans for mass consumption. Other means of propaganda are meetings, parades, brawls; in regions where the conflict is more aggravated (as in Galicia against the Poles, in Macedonia and Croatia against the Serbs, in Ireland against the English) nationalist militancy finds expression in acts of terrorism, arson, attacks by armed bands and similar outbursts. The sacrifices demanded by this activist propaganda and the even more stringent measures of repression applied by the reigning state serve merely to intensify the fanaticism of the nationally aroused masses. Very frequently national and social grievances are combined, as in Ireland during the nineteenth century and in contemporary India, forming the basis of political revolutions.

A nationalist ideology is central to all these forms of propaganda and its basis is found in a nationalist view of the historical development of the people. Although this historical picture is grounded less in immediate tradition than in popularized scientific investigation, the deep, mythlike belief in the national past is reflected in exact historical writing. The effects of the teaching of history on the development of sentiment are conditioned by these legendary forms of historical presentation. This accounts for the fact that the school occupies such a strategic position in the national struggle. Closely related to the nationalist view of history is the idea of a national mission, very often derived from history, particularly in the form of a desire for revenge or in the notion of "historical rights" which aim to rectify a past "injustice." The tenet of a "hereditary enemy" also tends to invest historical events with ideas of political and military obligations, especially where there

has been an evident transformation or secularization of religious and chiliastic basic ideas, as in the case of pan-Slavism and Polish messianism.

It is commonly assumed that there is a fundamental antagonism between nationalism and the idea of humanity. The development of German intellectual history from Herder through Fichte to Wilhelm von Humboldt and the romanticists reveals, however, a close and mutually reciprocal synthesis between the idea of humanity and cosmopolitanism and the idea of nationality. Catholicism also has attempted to harmonize humanity with nationality, although not always successfully. While its ecclesiastical organization and policy are constructed on an international foundation and therefore always evoke nationalist opposition, there are certain clearly supranational elements of belief and cultural forms which are conducive to an enlightened cosmopolitanism with which Catholicism seeks to counteract the individual nationalisms of the nations of the West. Actually nationalism has proved incapable of rediscovering and reanimating old discarded national religious symbols or of creating new and permanent symbols. Much more significant is the influence of nationalism in the cultural sphere. Here too the opposition between nationalism and humanity should not be exaggerated, since the latter often is manifested in national forms. Nationalism can most certainly raise existing tensions to the point of war or revolution. Moreover it not only nourishes a people's yearning for freedom but also steels their powers of resistance and their capacity for collective performance in all phases of civilization and culture.

It is very difficult also to distinguish with accuracy the differences between nationalism and imperialism and between internationalism and cosmopolitanism as regards their influence on world politics. Whereas the older English imperialism was generally free from nationalist characteristics, the German imperialism of the pre-war period represented the program of strongly nationalist circles. Italian Fascism likewise clings to a narrow militant nationalism, as revealed in its attitude toward the German and Slavic minorities. Particularly where nationalist forces are in power and where they are in control of the state, they degenerate easily into a chauvinism which looks upon intolerance and oppression as a sign of outward strength. Oppression and suppression of minorities, especially through brutality in the execution of

educational and administrative policies, prohibition of immigration, denial to nationals of the right to travel abroad, boycott of foreign goods, tariff restrictions and other forms of autarchic economic policy, are all typical examples of exaggerated nationalism. If it controls the state apparatus nationalism will attempt to repulse foreign criticism of its domestic nationalist policy by falling back upon the principle of non-intervention, particularly if the victims are elements of its own populations and not foreigners or minorities of another people, race or religion. In view of the close economic, cultural and political interrelationship between the various states and peoples the principle of non-intervention cannot, at least morally, be sustained today. Abnormal conditions of any sort within one country are bound to have repercussions in the international sphere.

Although nationalism and internationalism are considered to be mutually hostile, especially in the daily press and in popular agitation, it is not to be denied that an internationalism is conceivable which not only does not question nationalism but presupposes it. Such an internationalism will have to avoid any appearance of denying the validity of the existence of a variety of nations and of attempting to destroy or dull national self-consciousness. Once nationality were recognized as a basic element of civilization and history, such an internationalism would counteract the dangerous solipsistic tendencies inherent in all nationalism. This view of internationalism is current, for example, among the responsible leaders of the so-called national minorities, who insist that international law must recognize what in the *jus gentium* was an unfulfilled promise of the preservation of the rights of peoples and not of states. They urge the further development of international law, which politically narrow nationalism regards as an assault upon the sovereignty of the states and thus as an antinationalist factor.

The solidarity of world economic interests and the leveling of nations through technical advances in communication appear to foster a development of international feeling at the expense of national values. On the other hand, the events of the last thirty years have shown that the world has been held in a state of conflict by a succession of wars and revolutions in which political and military forces have predominated over the social and economic. In such an atmosphere, which will long continue to determine world history, nationalism may be ex-

pected to remain the spirit of the age. As long as the important states in which monarchism has been overthrown waver between representative and plebiscitary democracy, as they do at present, the tendency toward fusion of the national and political spheres and the resulting exaggeration of the political side of nationalism will be difficult to counteract. If nationalism does not shake off its Jacobin heritage and if it becomes instead the weapon of independent nations and national groups against all legitimate political power, the insane forces of destruction will triumph and chaos, already largely a concomitant of nationalism, will reign over all highly developed nations and eventually perhaps over the entire human race.

MAX HILDEBERT BOEHM

HISTORICAL DEVELOPMENT. From anthropological studies it is obvious that the tribalism which exists among primitive peoples today and which presumably flourished generally before the dawn of recorded history is a kind of nationalism. Each tribe has normally a distinctive speech or dialect, a peculiar pattern of social organization and cultural and religious observances, a special set of oral traditions and a particular manner of initiating its youthful members into the full life and lore of the tribe and of inculcating in them a supreme loyalty to it.

From historical studies, however, it is equally obvious that throughout most of the period of recorded history, say from 5000 B.C. to 1700 A.D., and wherever civilization was most advanced the earlier and primitive tribal nationalism tended to be submerged. To a very large degree it ceased to command the supreme loyalty and patriotism of civilized men. What submerged it and long kept it submerged was one or another or a combination of four historical developments, which substituted new types of human groupings and new objects of human patriotism. One was the advance and diffusion of the agricultural and industrial arts—the domestication of animals and plants and the expanding use of copper, iron and boats—which emphasized the interdependence of tribes. Another was the conquest and consolidation of tribes by military empires, such as the Egyptian, the Assyrian, the Chinese, the Persian, the Roman or the Arab. A third was the spread of intertribal religions, such as Buddhism, Christianity or Islam. A fourth was the development of literary languages, such as Sanskrit, Greek, Latin,

Chinese, and their employment by intellectuals of many different tribes in preference to the several tribal dialects of the illiterate.

In these circumstances tribalism was largely supplanted by either cosmopolitanism or localism. The masses, fused together from various tribes and yet marked off from the upper classes by economic, social and cultural discrimination, were usually quite local in experience and loyalty; their supreme patriotism was directed toward the agricultural estate or village, the commercial town or the petty feudal province in which they lived and labored. On the other hand, the upper classes, while they might be intensely loyal to city-state, to duchy or to county, were apt to associate a higher patriotism with an area and with ideas which covered more than the primitive tribes and even the larger aggregates which in modern times are called nationalities; in their cosmopolitanism they were devoted to the fusion of peoples in a common empire, a common religion or a common culture. For at least sixty centuries of recorded history warfare was not generally between such nationalities as have waged war in the last two centuries but between cities and provinces of kindred nationality or between international empires or religions. The conquests of the Roman Empire, the internecine struggles among the Greek city-states, the private feudal combats of the Middle Ages, the protracted crusading conflict of Christendom with Islam, displayed less the character of modern nationalism than that of ancient or mediaeval cosmopolitanism or localism.

It should not be assumed, however, that there was no consciousness of nationality among civilized peoples in ancient or mediaeval times. The fusion of tribes in an empire or a theocracy often served to create a fairly large community, which can properly be termed a nationality, with kindred language, customs and traditions, whose members, if not supremely loyal to the community as such and as a whole, if not as patriotic to it as their forbears had been to their several tribes, were quite aware that they were alike among themselves and different from foreigners, and on occasion they could evince a real nationalism. There were such occasions in the history of the ancient Egyptians, Jews, Greeks, Armenians and Persians. In the later Middle Ages acute consciousness of nationality was evidenced, for example, by Italians and Greeks in the fourth crusade, by Frenchmen and Provençals in the Albigenian crusade, by

Slavs and Teutons in their fifteenth century conflicts and by Frenchmen and Englishmen in the concluding phases of the Hundred Years' War. Yet, when liberal allowance has been made for these and other evidences of a historic nationalism which succeeded primitive tribalism, the fact remains that it was more spasmodic and less commanding.

In modern times and with continuously waxing strength since the seventeenth century nationalism has reemerged, first in Europe and then in other continents. It is akin to primitive tribalism in that it directs the supreme loyalty of its adherents to a community of language, customs and historic traditions. But it differs from primitive tribalism in noteworthy respects. Instead of being based on a small group of persons, banded together by actual blood relationship and by identity of religious practises and economic interests, it is based on a relatively large group of persons connected very distantly, if at all, by blood, professing almost any religion, or none at all, and having widely divergent economic interests. Modern nationalism, thus depending on larger units and being less substantial than primitive tribalism, is more artificially engendered and propagated; it relies more on conscious purposefulness, on the written and particularly on the printed word and on a special kind of mass education.

Modern nationalism has been a vital part of an extraordinary complex of economic, political, social and intellectual developments: the invention and spread of printing; the rise of national vernaculars as literary languages, accompanied by the decline of Latin and other international languages; the revolutionary growth of capitalism and of the middle classes; the role of aggressive divine right monarchs in suppressing feudalism and in consolidating and secularizing their realms on a national basis; the religious upheavals which eventuated in the disruption of Christendom and the establishment of state churches; the increasing commercial contacts and competition of one people with another, especially of "progressive" peoples with "backward" peoples; the changing emphasis from what is common to mankind to what is peculiar to a nation; the rise of humanitarianism, of individualism and latterly of the democratic spirit.

These developments took place first in western Europe. Here, from the fourteenth to the eighteenth century, national states were being formed and solidified by the cooperation

of ambitious monarchs with the rising middle classes against local feudalism and cosmopolitan ecclesiasticism. The economy of rural manor and urban guild was being transformed by the same means into a national economy, with the express purpose of regulating domestic industry and foreign commerce and colonization so as to promote the "wealth of the nation." Feudal and interurban warfare was being supplanted by warfare on a grander scale between nations, either for the dynastic aggrandizement of monarchs, who were becoming symbols of national power and prestige, or for the commercial and colonial advantage of upper and middle classes, who were becoming enthusiastic exponents of national, as against local or cosmopolitan, interests. Simultaneously apology for national interests and praise of national exploits, especially of military and colonial achievements, were being penned and communicated ever more widely within each nationality as more and more authors confined themselves to the common speech of the masses and utilized printing presses.

By the eighteenth century, thanks to geographical situation as well as to historical circumstance, England had experienced all these developments more fully than any other country in western Europe. By this time there was a lively English nationalism. From Milton and Locke in the seventeenth century to Bolingbroke, Blackstone and Burke in the eighteenth, abundant rationalization was provided for the nationalist ardor which already burned in the breasts of the agricultural upper classes and the commercial middle classes and which was shared in greater or lesser degree by the masses. Divine right monarchy, it is true, had been overthrown in fact if not in name, but it had already performed its nationalist role. A similar part was now played even more effectively by an aristocratic Parliament, whose members, drawn almost wholly from the patriotic upper and middle classes, could sincerely identify their own economic interests with national interests and could freely forward them amid popular approbation. This English nationalism of the eighteenth century was both cultural and political. On the political side it was aristocratic. Pride in being Englishmen and in possessing English traditions was the prerogative of all who spoke the English language as their mother tongue, but control and direction of English policies and real leadership in English nationalism were reserved to the upper classes.

In most countries on the continent, even in western Europe, nationalism was less advanced. In France, it is true, there was a rapidly rising consciousness of nationality and there had long been a form of national monarchy. But even here the sharp cleavage between social classes and the traditional loyalty of the masses to locality or province militated against national solidarity; and the Bourbon kings continued to address their subjects not as the "French" people, but as the peoples of Languedoc, Gascony, Burgundy, Picardy and other regions which had been acquired by earlier French monarchs. Devotion to dynasty seemed still to outweigh devotion to nationality, and *pays* to be more fundamental than *patrie*.

Elsewhere in the eighteenth century there might be stirrings of national consciousness and some pleas from intellectuals for cultural nationalism, but there was little nationalism of a strictly political sort. No monarch based his domestic or foreign policy on the principle of nationality. The masses divided their allegiance between the immediate locality in which they lived and the remote prince or king or emperor whom they had been taught to honor and obey. The upper classes served the non-national interests of themselves or their prince, and many of them, despising the national language as vulgar, adopted the current fashion of using French and posing as enlightened cosmopolites. There was no national school system, and armies were professional and mercenary rather than national.

In Germany, for example, no one in the eighteenth century expressed any desire for political nationalism. German intellectuals, equally with German nobles and peasants, seemed quite content to leave the fatherland parceled out among some three hundred separate and practically independent states and to suffer the domestic conflict of Hohenzollerns and Hapsburgs and the shift of the interest of the latter, the nominal leaders of Germany, from the home scene to the alien scenes of Hungary, Italy and Belgium. Very few Germans then talked about the desirability, much less the possibility, of unifying the hodgepodge of German kingdoms, duchies, counties and free cities into a compact national state and inculcating in all its inhabitants a new national loyalty which would transcend their traditional local loyalties.

Yet in this same Germany of the eighteenth century certain intellectuals taught the utility and practicability of a cultural nationalism. To

this end several factors contributed. One was the rise of Pietism, which represented on the part of a goodly number of clergymen, especially Lutheran clergymen, an enthusiasm for the "simple faith" of the common people as against the dogmatic and formal religion of the highly educated or the highly stationed. This meant a special regard for the masses, for their beliefs and observances, for their mores, and at the same time a special concern with elementary schooling so that the poor as well as the rich would be enabled to read the Bible in the common German tongue. Another factor contributing to the same end was the development of the *Sturm und Drang* and romantic movements, which brought about increased interest in folk language, folk literature, folk customs and folk personality and which in turn led to the emergence of the ideas of national language, national literature and national culture.

Meanwhile in France there was being implanted the seed of a novel type of nationalism—not a traditional, aristocratic nationalism such as was then flourishing in England and not a merely cultural nationalism such as was taking root in Germany and elsewhere, but a revolutionary democratic nationalism. Throughout the eighteenth century there was a marked quickening of national consciousness in France, an obvious tendency to distinguish between the monarchy and the nation, to exalt the latter while finding fault with the former. In the spirit of the current enlightenment attacks multiplied against the traditional and presumably irrational nature of many existing institutions—against divine right kingship, against the Catholic church (and supernatural religion in general), against privileges of class, province or profession, incidentally against the very historic developments which had been unfavorable to nationalism. In the spirit of contemporary "classicism" more praises were sung of the civic spirit of ancient Athenians, Spartans and Romans, and the meaning of the antique Latin word *patria* and its derivative "patriotism," although originally associated narrowly with a town or a locality, was now stretched to designate an ideal loyalty to the whole national state of France. Presently too in the spirit of rising romanticism a new enthusiasm manifested itself, especially in Rousseau, for the republican simplicity and virtue which would characterize France when the "common" and "natural" people should be rid of social discrimination and by exercise of their general will should usher in

a new regime, not only of liberty and equality but also of fraternity.

All these speculations were received with sympathy and ever louder acclaim by the expanding middle class, by a considerable number of peasants and artisans and by some upper class persons whose enlightenment or romanticism was superior to their class consciousness. And just such speculations were realized in substance by the great French Revolution of 1789-95, a noteworthy landmark both in the history of individualist democracy and in the evolution of modern democratic nationalism.

The French Revolution created a truly national state, in which distinctions of class and locality were abolished, the church was secularized and all political as well as ecclesiastical institutions were put on a national basis and made to serve national ends. It also enunciated the doctrine of national self-determination, that the members of a nationality have the right not merely to exercise popular sovereignty within the state of their birth but also, regardless of previous treaty obligations, to detach the place of their birth from any alien dominion and unite it with the national state of their choice. This right the new French nationalists invoked as justification, against the protesting exponents of treaty rights, for their incorporation of Avignon, Savoy, Nice and Belgium into France.

Likewise the French Revolution inculcated the doctrine that all citizens owed their first and paramount loyalty to the national state, and it sought in various ways to infuse them with an ardent national enthusiasm. It prescribed quasi-religious rites before altars of *la patrie* and over the remains of the dead fallen *pour la patrie*. It devised such nationalist symbols as a national flag, a national anthem and national holidays. It insisted upon linguistic uniformity and undertook to root out of France all foreign languages and local dialects. The French Revolution moreover elaborated the first general scheme of elementary schooling which should be maintained and controlled exclusively by the nation, which should be compulsory for all the boys and girls of the nation and in which national patriotism and national duty should be taught equally with the traditional subjects of reading, writing and arithmetic. The revolution too adopted and gave effect to the principle of the "nation in arms," the principle that all able bodied male citizens should be trained for war and liable to conscription for military and naval service. Finally, the French Revolution inspired the es-

tablishment of new kinds of newspapers and patriotic societies for the propagation of intense and sometimes quite intolerant nationalism among the masses.

So convinced were the French revolutionaries of the blessings of the new democratic nationalism for themselves that they were unable to conceive how it could fail to bless all other peoples. It was a peculiarly French mission, they believed, to spread the new gospel; it was in the highest sense humanitarian to spread this gospel, if necessary, by the sword. In December, 1792, the National Convention decreed: "The French nation . . . will treat as enemies every people who, refusing liberty and equality or renouncing them, may wish to maintain, recall, or treat with a prince and the privileged classes; on the other hand, it engages not to subscribe to any treaty and not to lay down its arms until after the establishment of the sovereignty and independence of the people whose territory the troops of the [French] Republic shall have entered and until the people shall have adopted the principles of equality and founded a free and democratic government."

The English were already too strongly impregnated with their own traditional and aristocratic nationalism, and the other peoples on the continent were still too much devoted to localism or class interests or dynastic loyalty—in other words, they were too lacking in any kind of political nationalism—to heed at once the French pleas for democratic nationalism. Indeed large numbers of Germans, Netherlanders, Spaniards and Italians—as well as Englishmen—actively supported their respective sovereigns in armed attempts to suppress what they termed the "excesses" of the French Revolution. Probably, as so often happens to missionary enterprise, what seemed altruistic and messianic to the crusaders appeared to their beneficiaries (or victims) to be selfish and downright satanic.

At any rate the French Revolution precipitated a series of gigantic international wars, in the protracted course of which the French themselves subordinated political democracy and individual liberty to military dictatorship in the person of Napoleon Bonaparte, won glory for themselves more than freedom for others and allowed the new democratic nationalism to become identified with militarism more than with peace. The wars, whether in their earlier republican aspects or in their later Napoleonic phases, stimulated enormously the national patriotism and national pride of the French

people. Eventually too they did much to arouse nationalist feeling among other peoples on the continent of Europe and similarly on the American continents. On the already developing cultural nationalism was now superimposed, in imitation of the French or in reaction against the high handed interferences of Napoleon, a yearning on the part of many Europeans for some form of political nationalism. Spaniards, Portuguese, Germans, Scandinavians, Italians, Poles, Greeks and southern Slavs gradually turned to the principle of nationality as a most promising aid to domestic harmony and self-respect and as a most efficacious safeguard against foreign exploitation and conquest. The leaders of these embryo movements in the first two decades of the nineteenth century were largely of the professional middle class, but some noblemen and clergymen participated conspicuously in them; and in certain cases even such dynasts as the Hohenzollerns, Hapsburgs or Romanovs found it convenient, at least temporarily and in emergencies, to champion the cause of political nationalism. This partially explains the rivalry of Hohenzollern king and Hapsburg emperor for leadership in the reconstruction of Germany and likewise the ambition of a Romanov czar to pose as the national king of Poland and to give succor to Greeks and south Slavs in their national rebellions against the Ottoman Empire.

The last great European statesman to oppose political and cultural nationalism consistently and with a large measure of success and to labor consciously to retain the earlier localism and cosmopolitanism was Metternich. His was the finally decisive role in the overthrow of Napoleon and the restoration of the Bourbons in France. His was the chief authorship of the territorial rearrangements effected at Vienna in 1815, the rejection of the doctrine of national self-determination and the redistribution of peoples among polyglot empires or petty principalities. His also was the chief guidance of those alliances of divine right monarchs who from 1815 to 1848 kept the principle of nationality out of the public law of Europe and cooperated to thwart the development of nationalism as well as liberalism and democracy in Italy, Spain, Germany and Poland. Yet nationalism, both cultural and political, continued to win converts and to make headway. Metternich could not anywhere wholly suppress nationalist propaganda, not even within his own Austrian empire; he had to acquiesce in the establishment of national states for Greeks, Serbs,

Belgians and Latin Americans; and he himself was deprived of power and influence by the nationalist upheaval of 1848.

From 1815 to 1880 nationalism in Europe and America—the only continents where it was as yet significant among civilized peoples—was closely related to liberalism. Nationalism had been too long a tradition in England and after the French Revolution it was too omnipresent in the continental atmosphere to be disregarded by such intellectual and “progressive” persons as the leading liberals. Liberalism could best be realized, it was believed, within the framework of a national state, within an England or a France or within a newly unified Italy or Germany rather than within an extensive, autocratic and privilege ridden empire, like the Austrian, the Russian or the Ottoman. Besides, much of the research of liberal scholars—historians, anthropologists, philologists—was romantically consecrated to the language and folklore, to the legal and political heritage, of particular peoples; and this research further stimulated the nascent cultural nationalism of Germans, Latins, Scandinavians, Slavs and Magyars. Both cultural and political nationalism became integral parts of nineteenth century liberalism.

This liberal nationalism, like that of the democratic French revolutionaries, was humanitarian in object and preachment; and if a bit timid about too rapid experimentation with political democracy, it was thoroughly sympathetic with the principle of national self-determination. It would redraw the political map of Europe—and of the world—so that disjointed parts of the same nationality would be knit together in a common polity, and supra-national empires would be broken up into their constituent national parts. It would make nationalities rather than states the units of “international” relationship and law. At the same time, however, the foremost liberal nationalists, unlike their democratic French predecessors, were strenuously pacifist by conviction and policy. Romantic liberals reacted sentimentally against the bloodshed, as well as against the despotism, of the French Revolution and the Napoleonic wars. Industrial liberals were convinced that war did not pay: it interfered seriously with commercial intercourse and it put heavy tax burdens on industry. For compulsive conflict in arms should be substituted free competition in material and intellectual production, not only within a nation but likewise

between nations. Let each nation like every individual exercise the right of self-determination; then, according to liberal doctrine, each would eschew imperial ambitions and monopolistic enterprises and pursue policies of free trade and peace.

Liberal nationalism inspired many intellectual, social and political developments between 1815 and 1880. In existing national states, such as England and France, it tended finally to replace aristocracy with middle class government, to enlarge the basis of direct personal participation in public affairs and to create popular sympathy for the efforts of "oppressed" and "enslaved" nationalities to free themselves from alien domination. Among these latter nationalities liberal nationalism did much to exalt the popular tongue, to resuscitate folk songs and folk customs, to revive or invent national traditions, to arouse popular enthusiasm for national heroes of the past and for the contemporary cause of national freedom and unity. Overseas the beginnings of national self-government in the British dominions of Canada, Australia and South Africa were a peaceful accompaniment of liberal nationalism.

In one very important respect liberal nationalism failed. It could not realize its ideal of basing the state system of Europe on the principle of nationality without sacrificing its ideal of pacifism. Subject and divided nationalities could not be freed or unified unless great empires were dissolved and local potentates were dispossessed, and such heroic action required more than a pious wish on the part of middle class liberals. Moral support of the masses at home and diplomatic aid of foreign governments were needed, and even then they seldom achieved their ends without armed insurrection and bloody war. So fighting became the practical means of transforming cultural into political nationalism. Under liberal auspices occurred the terrible rebellions of "enslaved" Greeks and Slavs against the Ottoman Empire and of "oppressed" Latin Americans against Spain; the riots of 1820 in Italy and Spain; the widespread insurrections of 1830 in France, Belgium, Germany and Italy; the even more widespread and deadly insurrections of 1848 in France, Germany, Italy, Switzerland, Bohemia, Hungary and Ireland; the Polish uprisings of 1831 and 1863; the Crimean War of 1854-56; the wars of Italian unification in 1848-49, 1859-60, 1866 and 1870; the wars of German unification in 1848-49, 1864, 1866 and 1870-71; the Balkan

war of 1877-78; and the mighty struggle of 1861-65 in the United States for the preservation of the national union and the emancipation of an enslaved race.

By 1880 some progress toward a new national and presumably liberal state system could be recorded. France and England and a considerable number of other countries in western Europe were under liberal governments. Germans and Italians possessed national states, as did likewise, with full independence or a large measure of autonomy, Greeks, Serbs, Rumanians, Bulgarians and Latin Americans. The people of the United States were more completely committed to nationalism, if not to liberalism.

Since 1880 greater progress has been made toward a world wide acceptance of nationalism, although the liberal element has notably lessened. This latest phase of nationalism, which tends to be more and more illiberal, seems to be closely associated in its origin and extension with the whole complex of developments which characterize most recent industrial civilization.

Peculiarly basic has been the development of large scale machine industry, with the impetus it has afforded to the growth of middle class and proletariat, to the improvement of means of transportation and communication and to the rivalry of peoples for economic advantage. In the main nationalism has flourished most abundantly in national states which have been most industrialized, and the advent of the industrial revolution among "oppressed" nationalities has been the most potent factor in arousing their national consciousness and in enabling them to create national states of their own. It has been naturally so. For, while industrialization favors commercial intercourse between peoples, it is even more conducive to commercial intercourse within each nation. It is easier and more natural to do business with persons who speak and read one's own language than with others. Exports and imports of an industrialized nation do not equal in value what it buys and sells at home. Credit and banking function nationally far more than internationally. Labor is organized by nations, and if it has international affiliations it subordinates them to what it considers to be its particular national interests. There is much more travel by people within a nation than between nations. There is more news in the public press about one's own nation than about others.

These consequences were not so obvious to

the economic liberals of the period from 1815 to 1880, when the industrial revolution was centered in England and was just beginning to affect other countries, as they have been to neo-mercantilists since 1880, with the revolution spreading rapidly all over Europe and America and even in Asia. If the whole world could have been industrialized simultaneously and uniformly, national differences might not have been emphasized and the liberal dream of "peace and universal brotherhood through free trade" might have been realized. Actually, however, no two countries have been at any given time in exactly the same stage of industrialization, and especially since 1880 each partially industrialized country has utilized the sentiment of nationalism and the power of national government to protect by tariffs and bounties its own industry against foreign competition and by labor legislation and restriction of foreign immigration to raise the standard of living of its own population. This is the new economic nationalism, which, assuming significant proportions in Germany and the United States early in the 1880's, has been seized upon and pursued with generally augmenting intensity by every civilized nation. Everywhere it has transformed economic interests of the masses as well as of the classes into national interests and has provided substantial foundation for the almost universal contemporary habit of referring to "national wealth," "national resources," "national production," "national labor supply."

With the speeding up and spread of the industrial revolution moreover it has been proved practicable in one nation after another, with increasing rapidity since 1880, to carry to unforeseen lengths certain developments which the democratic nationalists of the French Revolution had inaugurated—the democratic spirit itself, popular schooling, compulsory military training, cheap popular journalism and efficient societies for popular propaganda. The democratic spirit has been immensely quickened in the melting pot of modern cities, and the enormous migration from country to town, from farm to factory, has served to weaken traditional local ties and to identify the new democratic spirit with the new nationalism. With democratic pressure the augmenting financial resources of industrialized national states have been applied more and more to the establishment and maintenance of armed forces, in which every citizen is liable to service, and of public schools, in which every citizen is taught to read

and write. Armies and schools are alike quite national in organization and effect; while both are ostensibly humanitarian, the one to insure international peace and the other to promote individual well being, each is used primarily to inculcate in the masses a supreme devotion to their respective nationalities and national states.

There is still another very important element in most recent civilization which must be mentioned—the supplanting of the intellectual and cultural vogue of romanticism by what has conventionally been termed "realism." This realism has been the product of a variety of novel factors: absorption in the mechanical and utilitarian aspects of the industrial revolution; admiration for the "practical man" of big industry and big finance; acceptance of a mechanistic theory of the universe and of a materialist interpretation of human behavior; interest in sociology, with its "laws of society" and its fact finding inquests; distrust of human reason and trust in pragmatism and human will; adaptation of the biological hypotheses of Darwin to support such conceptions as the inequality of races, the "struggle for existence" and the "survival of the fittest"; enthusiasm for Nietzsche's "red blooded men" and for his "superman." The vogue of realism has paralleled not only the intensification of the industrial revolution but the rise of Marxian socialism and revolutionary syndicalism and also an epochal transformation of nationalism.

To this transformation the wars for national unification in Germany and Italy (from 1859 to 1871) contributed in no small degree. They had originally been undertaken by altruistic liberals for liberal ends, but eventually they evoked a strongly nationalist spirit of militarism and a boastful pride in the nation's achievement and the nation's mission. Then, backed by statesmen, business men and intellectuals who were falling under "realist" influences and fortified by effective agencies of popular propaganda, nationalism grew less and less liberal and more and more militarist, imperialist and intolerant. Such was the case not only in Germany and Italy but also in older national states, such as England, France and the United States, and presently, with the onward sweep of the whole complex of modern civilization, in Russia, Hungary, the Balkans and Japan. In the new circumstances free nationalities armed themselves with guns and tariffs as they had never been armed when they were "oppressed," and they entered into acute rivalry, military and

economic, with one another. At the same time, feeling that because they had won their own independence they must be better and more heroic than any other nation and mindful of economic needs and the duty of "superior" races, such nations as could proceed to conquer and impose their rule on "inferior" and "backward" nationalities. Usually with force and popular acclaim the nationalist great powers built huge new colonial empires after 1880. Simultaneously and with like acclaim many national states after 1880 displayed at home a highly intolerant attitude toward racial and linguistic (and sometimes religious) minorities among their own citizens; the official process of "nationalizing" such minorities was known by different names in different countries—Russification, Germanization, Magyarization and so on. Short of formal state action private societies and political parties waged vigorous campaigns, in the name of nationalism and on a wide front, against the Jews—in Germany, Austria, France, Rumania, Russia and elsewhere. The emergence of Zionism at this time was in part a Jewish reaction to the stimulus of antisemitism.

Nationalism paved the way of statesmen and prepared the mind of peoples for the World War. The costliest and most widespread and most terrible in human annals, this war was chiefly nationalist. Its immediate cause was the murderous activity of a secret nationalist society of Yugoslavs. Its fighting was done by "nations in arms," whose morale was sustained by nationalist propaganda through schools, press and special associations. Its most obvious immediate result was the triumph of the principle of national self-determination in central and eastern Europe. The last of the non-national empires on the continent were shattered—the Austrian, the Russian and the Ottoman—and from their ruins were constructed new or enlarged national states—Finland, Estonia, Lithuania, Poland, Czechoslovakia, Yugoslavia, Rumania and Greece.

The World War not only issued from nationalism but led to a more intense nationalism. In Europe the newest national states almost instantly passed from liberal pronouncements to illiberal conduct and speedily vied with older national states in establishing nationalist tariffs, armies, schools and other agencies of propaganda and in discriminating socially if not legally against dissident minorities. In connection with this last statement it should be remarked that while the new map of Europe conformed in general to the principle of nationality, the

population in some parts of the continent was so mixed in nationality or a particular region was so insistently demanded by one of the victors for commercial or strategic considerations that all the new national states (and some of the old) embraced minorities of alien nationality. To those states the temptation of "nationalizing" their minorities was strong, while states like Germany and Hungary were at least equally tempted to regard the populations and areas which they had lost as "irredentas" which must be regained as soon as possible. Agitation for the recovery of "irredentas" and movements for the "nationalizing" of minorities are alike dangerous to internal and international peace.

Then too, taking advantage of economic distress and of the enhanced nationalism of the post-war period, demagogues and dictators have risen to positions of influence or power in several European countries and have used their position to preach or enforce an ever more intensive and exclusive nationalism. The most striking illustrations of this have been the conversion of Mussolini from socialism to nationalism and the establishment and maintenance of his Fascist regime in Italy and the ascension to power of Hitler and the Nazi movement in Germany with their hostility to Jews, Poles, the French, Catholics and any other groups at home or abroad who are assumed to belie or belittle German nationalism. Somewhat similar phenomena have attended post-war dictatorships in Poland, Lithuania, Hungary and Yugoslavia and, on widely different intellectual levels, the propaganda of the Ku Klux Klan in the United States and of the Action Française in France.

In contemporary Russia the Communist dictatorship, while theoretically basing itself on the doctrine of the class struggle and claiming that extreme nationalism must pass with the passing of capitalism, has actively patronized cultural nationalism and is actually pursuing such social policies as are likely to prove especially effective in attaching the Russian masses to their national state and filling them with patriotic ardor. It seems in general as if Marxian socialism in power may readily reverse the historic role which it played when out of power and become quite nationalist; a dictatorial social democracy might well contribute even more than a bourgeois political democracy to national solidarity and hence to nationalism. The twentieth century has already shown that at least with certain individual socialists and revolutionary syndicalists enthusiasm for class conflict can fairly

quickly he transmuted into enthusiasm for national conflict.

Notable features of post-war nationalism have been its stimulation among relatively small or hitherto submerged nationalities in Europe and its rise among great and mixed populations in Asia. In Europe not only has there been an increase in the number of small sovereign national states, not only have such nationalities as the Finns, Estonians, Latvians, Lithuanians, Czechs Irish and Catalans acquired political independence or autonomy, but more or less insistent nationalist demands have been voiced by Flemings, Bretons, Basques, Scots, Icelanders, Ukrainians, White Russians, Macedonians and Maltese. The trend appears to be toward smaller cultural, and political, units.

In Asia, although the Japanese evinced a kind of nationalism in the seventeenth century, they learned a good deal about it as well as about other matters from Europe in the nineteenth century. Nationalism in its modern form, with its industrial and social accompaniments and with its systematic propaganda through schooling, military service and popular press, has become a vital force in Japan only since 1870 and in other Asiatic countries even more recently. Indeed it is only in the post-war period that nationalist movements have assumed highly significant proportions in China, India, Persia, Mesopotamia, Syria and Egypt. It may be added that the recent so-called Indian renaissance in Mexico and various countries of South America is essentially nationalist.

Nationalism is now obviously a world wide phenomenon, vitally affecting both the material and the intellectual development of modern civilization. It tends more and more to influence the economic and spiritual as well as the political relationships of mankind. It is so closely related to the whole complex of contemporary culture that any change in its direction or intensity would seem to wait upon an alteration of other factors in the complex.

NATIONALIST PARTIES. See **PARTIES**, **POLITICAL**, sections for various countries.

NATIONALITY is defined in article 1 of the model code on the Law of Nationality (Harvard University, Research in International Law, *Nationality*, Cambridge, Mass. 1929) as "the status of a natural person who is attached to a state by the tie of allegiance," and it is in this sense that the term is used here. Nationality is a reciprocal relationship, involving claims of the national upon the state as well

as obligations of the national to the state. Although not necessarily indissoluble, the allegiance of a national to his state is said to be permanent, as distinguished from the temporary allegiance or obligation of obedience owed by an alien resident or visitor. While nationality is sometimes used broadly with reference to blood relationship, in the strict legal sense there is no necessary connection between them. Thus under the laws of most modern states nationality may be acquired through naturalization by aliens having no blood relationship to the individuals comprising the main body of the national community; and in most of the imperial states, including the United States and the British Empire, the great mass of inhabitants of the outlying possessions are racially very remote from the inhabitants of the mother country.

In considering the subject of nationality it is important to bear in mind the fact that its meaning has not always been what it is today, but has changed with changes in the character of states. A distinction is now generally recognized between nationality and citizenship although the latter is frequently employed as a synonym for the former. The corresponding term, subject, is used in states having personal sovereigns. Citizens are included in nationals, but not all nationals are citizens. The latter term refers to the highest political status in the state and ordinarily connotes participation in government by exercise of the franchise or otherwise. The classification of nationals into citizens and non-citizens was found in the ancient republics, notably in Athens and Rome, where originally citizens were a minority of the population. The privilege of Roman citizenship, carrying the important civic rights of *commercium* and *connubium*, was at first restricted to the governing class in Rome proper but was extended for reasons of policy in the year 121 B.C. to the Latins, in 90 B.C. to the inhabitants of all Italy and in 49-48 B.C., under Julius Caesar, to the inhabitants of Cisalpine Gaul. Finally under Caracalla all the free persons then living in the empire were declared citizens. In most of the larger modern states there are nationals who either lack citizenship altogether or who have only a local and limited citizenship. Thus citizens of the Philippine Islands are United States nationals but not citizens of the United States. It is noteworthy that the term citizen is found throughout the Constitution of the United States, while national is never employed. The

acts of Congress raising the status of the inhabitants of Porto Rico and the Virgin Islands to that of citizens of the United States and the recent act providing for the future independence of the Philippine Islands may be regarded accordingly as in a measure restoring to the United States the political character envisaged by its founders.

Nationality is important to the individual, not only with regard to political rights and privileges but also because his civil status and capacity may be dependent upon it. In some states the right to hold real property is to a greater or lesser extent dependent upon nationality. Although most of the states of the United States allow aliens to hold real property, in a number of states this right is limited. Thus some states confine it to aliens racially eligible to citizenship, others to aliens who have declared their intention to obtain naturalization and others to those who are resident in the state. Some states limit the amount of real property which may be owned by an alien. These limitations have been held valid by the Supreme Court of the United States in a number of cases [*Hauenstein v. Lynham*, 100 U. S. 483 (1879); *Blythe v. Hinckley*, 180 U. S. 333 (1901); *Terrace v. Thompson*, 263 U. S. 197 (1923); *Porterfield v. Webb*, 263 U. S. 225 (1923)]. State laws concerning alien property are of course subject to treaties between the United States and foreign powers. The Supreme Court has also upheld the constitutionality of state and municipal laws and ordinances prohibiting aliens from being employed on public works [*Heim v. McCall*, 239 U. S. 175 (1915)] or in specified occupations [*Clarke v. Deckebach*, 274 U. S. 392 (1927)], although it has denied the right of a state to limit the number of aliens employed by a private employer [*Truax v. Raich*, 239 U. S. 333 (1915)].

In public law nationality is of great importance, not only with regard to the right of the state to demand certain services from its nationals, particularly military service, but also with regard to the right of the state to protect its nationals in foreign countries when they are unable to obtain justice through an appeal to the appropriate authorities of the foreign state. In many countries the jurisdiction of the criminal courts attaches when the defendant is a national of the state to which the court belongs, regardless of the locus of the crime. Thus Italian courts will try and penalize Italian subjects for murder and some

other offenses whether committed in Italy or abroad, and the same is true of French courts with regard to crimes committed by French citizens. The British law, while primarily territorial, also punishes its subjects for murder and a few other crimes, wherever committed.

The question whether or not a person is a national of a particular state, in the usual sense, is determined by the municipal law of that state, although the right of the latter to claim persons as its nationals is subject to some limitations. The grounds upon which a state may claim persons as its nationals or thus designate them are fairly well marked out by customary international law. It is true that section 12 of the Immigration Act of 1924 of the United States (43 Stat. 153) arbitrarily classifies an alien, for purposes of the act, as having the nationality of the foreign state in the territory of which he is born, regardless of whether he is a national of such state under its law. This arbitrary rule, however, is hardly open to objection by any foreign state, since it relates solely to the classification of aliens applying for entry into the United States. It is the basis of the quota system, the object of which is, broadly, to retain the existing racial character of the population and citizenry of the United States.

While most of the nationals of a state are ordinarily found domiciled in its territory, domicile and nationality are not identical. Legal domicile has been defined by Joseph Story as the place where a person "has his true, fixed, permanent home, and principal establishment, and to which, whenever he is absent, he has the intention of returning." Domicile, unlike nationality, is not generally recognized as conferring the right to diplomatic protection by the government of the state of the domicile when the domiciled alien is visiting another country. This is true notwithstanding the action of Secretary of State Marcy in the *Kosztka* case, in which a resident alien who had declared his intention of becoming a citizen of the United States and who was an expatriate of the Austro-Hungarian Empire was given diplomatic aid (Moore, J. B., *A Digest of International Law*, vol. iii, Washington 1906, sect. 820-54). In time of war alien merchants domiciled in a belligerent country are assimilated to the nationals of the latter with reference to the laws of war governing trade with belligerents.

Acquisition of nationality at birth may rest either upon *jus sanguinis*, whereby nationality

is derived from a parent, ordinarily the father, regardless of the place of birth, or upon *jus soli*, under which nationality is derived from birth in the territory of a state, regardless of the nationality of the parents. *Jus sanguinis* is undoubtedly the older basis of nationality, since blood relationship was the origin of primitive political organizations. The familiar history of the early Hebrews, Greeks and Romans bears this out. In every case the nation is divided into a number of tribes, each composed of families, nationality being based upon membership in these families.

Jus soli is said by some authorities to have its origin in the Germanic monarchies, in which allegiance to the king was the bond of union among the members of the various tribes. When the kings obtained fixed territories, their authority became coterminous with their holdings and allegiance was demanded as a matter of right. All inhabitants, and habitancy was most easily determined by place of birth, were regarded as the subjects of the king, while nationals, in so far as the concept was then recognized, were considered subjects of his state. Other writers hold that *jus soli* was derived from the feudal system. Feudalism certainly greatly emphasized the relationship between domicile and allegiance. Except in England, however, the relationship existed primarily between the vassal and his overlord rather than between the former and the king. Under the feudal custom elaborate formalities and express permission were necessary in order that a vassal might be released from his allegiance or fealty. This was the origin of the theory of indissoluble allegiance, representing a retrogression from the liberality of the Roman law, which recognized, theoretically at least, the right of expatriation. The doctrine of *jus soli* pervaded the common law both in England and on the continent until the reception of Roman law introduced again the principle of *jus sanguinis*. *Jus soli* and indissoluble allegiance, two incidents of the peculiar political organizations which developed over the greater part of Europe in the Middle Ages and which differed so widely from the organization of the modern state, have, however, survived.

Jus soli has been retained as the basis of nationality chiefly in Great Britain. It survives also in the United States and in the British dominions and to a greater or lesser degree in the Latin American republics, because of the practical expediency of claiming the alle-

giance of the children born of alien immigrant parents in their undeveloped territories. *Jus soli* was regarded as common law in the United States long before the passage of the Civil Rights Act of 1866 (14 Stat. 27), by which it was definitely confirmed, and it was likewise the basis of French law for many generations prior to the adoption of the *Code Napoléon*. While the laws of Germany and of several of the other states of continental Europe as well as those of China and Japan confer nationality at birth under *jus sanguinis* only, except in the case of foundlings, the laws of most states have taken over both principles or combinations of them. Thus *jus sanguinis* was adopted in the United States first in an act of Congress of 1790 (1 Stat. 103) and again in an act of 1855 (10 Stat. 604), reenacted in 1873 (Revised Statutes, sect. 1993), by which a child born outside the United States is a citizen of the latter if his father is a citizen of the United States and has ever resided there.

The coexistence in the laws of most states of *jus soli* and *jus sanguinis* gives rise to many cases of dual nationality. There seems to be no likelihood that the various states can be persuaded in the near future to adopt a single basis for acquisition of nationality at birth, and at the Conference on the Codification of International Law held at The Hague in 1930 no measure looking to such uniformity was introduced. The conference did, however, adopt an international protocol relating to Military Obligations in Certain Cases of Double Nationality, making residence the test of liability. This protocol has been ratified by the United States, Brazil, Sweden, the British Empire (including India but excepting all the other states which are separate members of the League of Nations), and when it goes into effect will furnish a satisfactory solution of many troublesome cases.

An important branch of the subject of nationality is found in the laws concerning naturalization, which involves also the problem of expatriation and the controversial question of whether there is such a thing as a natural right of expatriation as proclaimed by the Congress of the United States in an act of 1868 (15 Stat. 223 subsequently embodied in sections 1999-2001 of the Revised Statutes). Controversies between nations over this right have to some extent been settled by treaties. In many states naturalization in a foreign country or continued absence involves loss of nationality. In the

United States the prolonged absence merely raises a rebuttable presumption of renunciation of nationality. Marriage of a woman national to an alien, except in the United States and several other countries, leads to a loss of her nationality. There is also the problem created by persons who have lost their old nationality without ever acquiring a new one, a problem which assumed tremendous proportions during the World War.

In view of the differences in the geographical, political, ethnological and economic conditions of the various states it is inconceivable that uniformity in nationality laws can be agreed upon in the near future. It is doubtful indeed whether any real benefit would be gained by such uniformity. But it should be possible, if sufficient efforts are made and the need of large standing armies does not overshadow all other considerations, to reach satisfactory international agreements for the settlement of certain conflicting claims arising out of the diversity of nationality laws, especially with regard to the status and obligations of naturalized citizens and persons born with dual nationality.

GENERAL SUMMARY.....	STEPHEN H. ROBERTS

NATIVE POLICY

LATIN AMERICA. When the Spanish state was forced to take account of the new territories incorporated under the crown of Castile, to intervene actively in their affairs in order to impose its sovereignty and to organize them according to the norms of public law, there developed a native policy imbued with two fundamental motives which in practise frequently conflicted—the conversion of the Indians to Christianity and the exploitation of the natural riches, especially the mineral deposits, by the use of native labor. Almost from the first a plan of complete assimilation was followed. The

Indies were organized after Spanish models; Castilian law was made expressly operative as a supplementary law; the natives were declared free vassals of the crown of Castile; and mixed marriages, which in the form of concubinage had been common from the beginning, were encouraged.

Modification of this scheme soon became necessary not only because of wide differences among the various native peoples—including such divergent types as the semicivilized agriculturists of Mexico and Peru and the wild tribes of the Antilles—but also because of the cultural differences between the colonists and

the natives, the tendency of the Indian to isolation and to the avoidance of steady work, and the exploitation of the aborigines by the invaders. The indigenes were placed in *reducciones*, or settlements separated from the Spaniards, under the political and (if he were a *licenciado*) judicial jurisdiction of a royal official, the *corregidor*; they enjoyed, however, a certain administrative autonomy and were ruled by *alcaldes* and other local functionaries chosen from their own ranks. In the *reducciones* families were assigned *resguardos*, or lots of land for cultivation; these were inalienable without official permission. Lands for pastoral and other purposes were marked off for communal use. The Indians were encouraged also to form community welfare funds (*cajas de comunidad*). The clergy supplied the stimulus to this partially isolated settlement of the conquered natives by the state; but certain religious orders, principally the Jesuits, carried the method of isolation much farther in so-called mission territories. When by the beginning of the seventeenth century the semicivilized societies of Mexico, Central America, northern South America and the Andes had been subdued and lay elements were unwilling to undertake to pacify the wilder tribes, the mission, subsidized by the monarch, became the chief instrument for advancing the frontier. Within its confines the Indians were put under the tutelage and rigid discipline of the clergy. Cultivating their lands in common, they enjoyed a considerable degree of economic well being. They were, however, totally isolated from other Indians as well as from the colonists; in fact the Jesuits did not foster the use of the Spanish language.

The administrative organization of *reducciones* and missions, the communal land tenure and the community funds were in great part derived from pre-Columbian institutions existing in such highly organized centers as Peru. Native customs received legal sanction in so far as they did not contradict the basic Spanish principles, and the native organization of the Indians in Peru and Mexico facilitated the establishment of a seigniorial regime (see AGRARIAN MOVEMENTS, section on LATIN AMERICA).

Almost from the beginning enslavement of the Indians was prohibited; this was confirmed by a papal bull of 1537. Enslavement was legal only in the case of just war, as against the persistently rebellious and reputedly cannibalistic natives of the Caribbean islands. But if the Indians were free men, they were considered to be minors requiring tutelage and protection.

The demand for workers and the necessity of rewarding the colonizers resulted in the imposition of forced labor. The Indians were grouped into *repartimientos*, or allotments to individuals and public bodies for some specific employment—mining, farming, cattle raising, domestic service—and into the so-called *encomiendas*. Legally the *encomienda* was a tutelary institution; the *encomendero* was obliged to provide for the religious education of his charges, and in return for his patronage, which covered all spheres of social and juridical life, he was permitted to call upon the services of the *encomendados*.

Derived from the seigniorial regime of mediaeval Spain and legally sanctioned as early as 1504, the *encomienda* was vigorously opposed by some Spanish clerics and moralists, especially Las Casas (*q.v.*), but its legality and expediency were defended by most jurists and officials. In 1542, after deliberation by various councils of theologians, the *Nuevas leyes* were proclaimed. Besides setting forth high standards for the treatment of the Indians and abolishing personal service they provided for the gradual abolition of the *encomiendas*. The bitter protests of the *encomenderos* culminated in Peru in a bloody rebellion led by the Pizarros. The *encomiendas* were permitted to continue in force, but many provisions of the *Nuevas leyes* and earlier legislation favorable to the Indians remained permanently incorporated in colonial law. In the earlier years *encomiendas* were granted only for the life of the *encomendero*, but after 1536 succession to the second generation was admitted and this was soon extended to the third and fourth. Alienation, however, was forbidden. Upon the death of the last successor the Indians reverted to the crown and could again be indentured. In the second half of the sixteenth century the obligation of personal service was replaced by a system under which the Indians were free to benefit from their own labor on the sole condition that they indemnify the *encomendero* by a tribute fixed by the authorities. With few exceptions all male Indians of working age were under obligation to pay the tribute to the *encomendero* or to the king, but many Indians succeeded in evading this requirement.

Forced labor, established for all idle inhabitants of the colonies, constituted a real burden only in the case of the Indians, despite certain measures designed to soften its rigors. Thus only where absolutely necessary for the

provisioning of the cities could Indians be employed as carriers; the number to be used was to be judicially determined, and all so employed had to be over eighteen. The weight of the burden was also limited. Work in the mines, prohibited in 1549, was permitted in 1551 and even declared obligatory with the institution of labor shifts, known as the *mita*. In order to protect the *mitayos*, who were drafted for a certain period, numerous regulations covering the length of service, hours, payment, health conditions, types of labor, education and religious instruction were adopted; even with all these safeguards the *mita* was permitted only because of a lack of voluntary labor and was to be replaced by Negro slavery. Because of economic considerations, however, such substitution was never effected. In order to ensure an adequate supply of labor for the mines and to further the system of voluntary service an effort was made to establish in the mining areas settlements of Indians, to whom were granted cattle and lands for crops. The *mitas* for work outside the mines were also the subject of protective legislation. In 1609 conscriptions for forced labor were abolished and it was ordained that the Indians should be hired in public market places by individuals or corporations, with whom they should agree upon the period of employment. The legislators intervened repeatedly to regulate these work agreements. Despite the spread of voluntary labor the *mita* continued in force.

Forced labor of Indians under the age of eighteen was prohibited and labor of women and children was specially regulated. Hospitals, houses of correction for girls and young women, and educational institutions were established for the Indians, while their status as minors freed them from the jurisdiction of the Inquisition, tempered certain criminal penalties, such as that for bigamy, and secured a simplified judicial procedure for them. Their defense in civil and criminal suits was in the hands of the special guardians and protectors designated to watch over their interests and of the *fiscales* of the *audiencia* (*q.v.*).

Aside from the slaves and the theoretically free Indians there were, first in Peru and later elsewhere, Indians called *yanaconas*, who were considered to be serfs attached to the estates upon which they worked.

The exaggerated if well intentioned propaganda of Las Casas and others gave rise to the so-called black legend, which represented Spanish colonization in America as an example of the

greatest cruelty and which was fostered by historians inspired by national prejudices. In modern times, however, there has developed a powerful reaction favorable to Spain. To Spain's credit are the humanitarian laws which modern Latin Americans regard as the precursors of their own social legislation; and while their profuseness indicates that they were frequently flouted by officials, landowners, priests, their own caciques and other oppressors of the Indians, many witnesses testify that they were not entirely ineffective. It is also necessary to recall the contemporary condition of the lower classes in Europe. Moreover the Spanish policy of forced labor found a place, if a subordinate one, for the Indian in the colonial society.

The practise of treating with the Indian tribes as sovereign nations, common in North America, was not generally followed by the Spaniards (see LAND GRANTS, section on LATIN AMERICA). Where, however, the conquerors failed to bring adequate force against natives well organized for warfare, the latter were able to resist conquest until long after the close of the colonial era. Thus the Spaniards were forced to parley with the mounted Araucanians of southern Chile and the La Plata region, give them gifts and acknowledge their virtual independence beyond certain boundary lines.

The practise of racial crossing resulted in the development of a hybrid race—the *mestizos*, *cholos* or *gauchos*—which in most Latin American countries is becoming increasingly the national type. The preservation of native customs and organization, besides checking the usually disastrous results of disorganization, served to establish many features of local government and cultural life, which survive in modern Latin America often beneath formal structures of a very different kind. Similarly the religion of the Indians in many instances remains fundamentally pagan.

Although the legislation contemplated that within ten years the mission village would be converted into a center of Spanish civilization, the unattractiveness of many of the sites for Spanish and mestizo settlers, the unwillingness of the missionaries to yield control and their isolationist policy retarded or completely checked this process. In addition the mission regimen made impossible the development of a self-reliant personality. Thus the missions accentuated the failure of the Spaniards to attain a unified culture in Hispanic America.

The humanitarianism of the eighteenth cen-

tury, the uniformist tendencies of the Bourbons and their desire for increased revenues influenced native policy considerably. Legislation incorporating the *encomiendas* into the crown was promulgated as early as 1720 and as late as the reign of Charles IV, by which time the institution had largely lapsed. Action was also taken against forced labor, which continued, however, either in defiance of law or under the legalized debt slavery known as *peonage* (*q.v.*). Indians also remained attached to estates as customary tenants and laborers, practically serfs. The office of the *corregidores*, who oppressed the Indians by forcing them to engage in trade with them, was generally abolished with the introduction of intendants, who were charged with avoiding abuses by local officials. The expulsion of the Jesuits from the Spanish dominions in 1767 struck a telling blow against the mission system, particularly in their great center in Paraguay, and many of their charges relapsed into savagery or fell prey to the colonists. In some regions, notably in northern Mexico, the Jesuits were replaced by the Franciscans and other orders.

With regard to both methods and results Portuguese native policy in Brazil offers strong analogies to the Spanish, with its conflict of economic and religious motives and the early assertion of the assimilative policy. Enslavement, however, which had attained a marked development in the Portuguese colonies in Africa, characterized the sixteenth century; from 1570 constantly changing legal restrictions on the practise were introduced and sometimes it was entirely prohibited. The union of Spain and Portugal (1580-1640) resulted in the adaptation of Spanish practises, the Jesuits providing the driving force for humanitarian measures. In 1611 a variation of the *encomienda* was introduced under the name of *administrações*. Peaceful subjection of the Indians was to be accomplished by a layman, or "captain," accompanied by a religious. The captain was to be judge and seignior of the settlement; coercion for his own service was prohibited, but his charges might contract for service with others. The captains were usually half breeds and government under native chieftains developed also; the system of forced labor evolved into a sort of *mita*. The Jesuits, opposed to the administrative system, struggled for control throughout the seventeenth century, sometimes gaining complete sway over the Indian villages. Like their Spanish brethren they favored the importation of Negroes, which

in fact became more widespread than in the Spanish colonies outside the Antilles region and eventually resulted in benefiting the Indians. Another compromise was the division of the newly subdued Indians into three groups, two of which were to alternate between cultivation of their lands in the villages and work for private individuals, while the third was placed under direct control of the missionaries. In 1686 a fixed number of aborigines were set as the *padres'* share. This apportionment system prevailed in the eighteenth century when the missions, centered in the north, were in a prosperous condition and the Jesuits, who in addition possessed numerous Indian slaves, occupied their charges in their own service while the colonists complained of a labor shortage. Nevertheless, the same forces which influenced Spanish policy in this period functioned in Portugal. Between 1755 and 1758 Pombal expelled the Jesuits, declaring all the Indians of Brazil to be freemen equal to all other subjects. In the latter year, however, he sanctioned the virtual restoration of the administration system under the control of so-called directors of the Indians, despotic individuals generally chosen from the military class. The ensuing decay and reversions to savagery resulted in 1798 in legislation abolishing the office and placing the Indians under general law, but allowing the imposition of forced labor. As late as 1808 open warfare was declared against some of the Indians and their enslavement for a term of years was permitted. At the end of the colonial era the Brazilian Indians were the prey of all the traditional enemies of the aborigines.

Since the winning of their independence advances of settlement have been made in Latin American countries into the numerous territories over which the Spaniards failed to establish supremacy, although, as in various parts of Colombia and Venezuela as well as in the Amazon basin as a whole, control is still very loose. On the Argentinian pampa, where the Indians encouraged by the officials on the Chilean side of the Andes had engaged in cattle raiding over the mountains, the gradual advance of settlement signified the virtual extermination of the natives. For some time after independence the policy of treaty making was continued, while Indian raids constituted a menace to important centers of population. Finally in 1867 the policy of forcible occupation of the native territory was adopted; the Indian frontier was established at the southern end of the pampa and the natives

were guaranteed everything necessary for their settled existence. The conquest was completed under General Roca (1878-79) and the Indians were driven beyond the frontier or colonized in the agricultural settlements of the northern pampa; women and children were distributed among Argentinian families. From time to time land in Patagonia was apportioned to caciques and their tribes in full proprietorship or insecure occupancy tenure.

In Chile the process of incorporating the Indians of forested Araucania had begun in the late eighteenth century. Caciques were subsidized and given titles; missionaries, traders and settlers who procured land from the natives entered the country in increasing numbers. During the struggle for independence loyalists were more successful in winning over the Indians, some of whom never submitted to the Chilean government. Civil conflict also augmented the restlessness of the Indians in the earlier years. From about 1860 a definite policy of incorporating the Araucanian territory was followed continuously: fortified towns constantly pushed back the frontier, strong garrisons sufficing usually to intimidate the natives, who were given land for their own use while their customs, including inheritance and polygamy, were respected. Their last uprising occurred in 1881; the last parley was held in 1883.

The aborigines of Tierra del Fuego, which is divided between Argentina and Chile, were practically exterminated by gold seekers and sheep raisers who invaded their territory from about 1880. Although as late as the first decade of the twentieth century the various tribes of the Chaco constituted a menace to colonists and soldiers, this region has also been the scene of encroachments by cattle farms and plantations and punitive expeditions have reduced the natives to submission.

In older centers constant encroachment drove the communities of semicivilized Indians for the most part into isolated mountainous regions (see LAND TENURE, section on LATIN AMERICA). But the Indian remained the chief source of labor supply in most of the countries, and his labor was governed by the system of extensive cultivation followed by the politically dominant *terratenientes*. Constant increase in the areas under cultivation necessitated an ever greater supply of workers; this was usually obtained by binding the savage or communal Indian to service on the hacienda under the system of peonage. Like the colonial forced labor systems,

peonage was probably the chief means of assimilating the native. Through forced or voluntary labor the Indian came to serve also in mining and newer types of enterprise, although until recently he was not generally considered capable of operating machinery. In the vast Amazon basin the natives were utilized on rubber plantations; the accompanying abuses, in part a result of the difficulty of establishing control in remote territories under conflicting jurisdictions, finally aroused world indignation.

Inspired by French revolutionary ideas and to some extent also by the legislation of the Indies, the patriots who framed the early Latin American constitutions proposed to proclaim the Indians equal to all citizens and to grant land to the landless. Equalitarian legislation was promulgated in Venezuela in 1811, in Argentina in 1813, in Chile in 1819 and in Peru in 1821. Communal lands were ordered to be divided up and the checks upon alienation removed. But the disastrous results of such legislation soon became evident and although the law generally maintained the principle of individualization, alienation was restricted. As early as 1825 Bolívar prohibited the alienation of the lands of the Peruvian Indians until 1850; in 1828 this was modified to permit free alienation by owners who were literate. In Colombia alienation of the *resguardos* was prohibited in 1832 and 1843; Chile introduced restrictions on alienation in 1853.

The proclamations of equality and the attacks on communal land tenure implied an assault upon native customs and internal government, which was counteracted, however, by isolation and the communal resistance. In fact there was a dual governmental organization, the formal structure being superimposed upon the Indian system. Occasionally too the law permitted deviations from the principle of uniformity, especially when, as in Venezuela in 1856 and in Colombia in 1874, attempts were made to control the nomadic tribes. In certain cases the inferior status of the Indians under the colonial regime was maintained in whole or in part. In 1830 the laws of the Indies were declared effective in Ecuador. Bolívar in 1826 restored the tribute in Peru, for the necessities of the struggle for independence made this a highly important source of revenue. It was abolished in 1857 in Ecuador and in 1854 in Peru, where a new source of income had been found and where the liberals linked their action with the abolition of slavery.

The movement against the missions, begun in the eighteenth century, was aided in the independent period by the fact that the royal subventions were cut off. Moreover the members of the orders were inclined to favor and even to incite their charges to fight for the royalist cause; it was for this reason that the Capuchins were expelled from Venezuela. By attacking the church influence and property the liberals continued to hamper mission work. The conservatives, on the other hand, were inclined to invite the orders to return; in Chile the restoration process began as early as 1832.

As the various countries with a considerable proportion of Indian population approached the centenary of their independence, compared their political, social and economic situation with that of the United States, noted the wretchedness and isolation of their communal Indians (many of whom do not speak Spanish) and the misery of the peon and recognized their failure to attract a considerable flow of immigrants, they awoke to the realization that the aboriginal population was perforce their chief reservoir of labor and that the unsolved Indian problem was the greatest cause of their backwardness. This recognition came at a time when interest in the lower classes was increasing throughout the world, but it was associated also with the emergence of a spirit of Indian nationalism originating in the struggle for independence which achieved vitality when linked with the hitherto sporadic uprisings of the downtrodden natives. Indianism is in the main still confined to intellectuals and mestizo politicians; but contact with the towns, army service and the influence of missionaries and agitators have served to make the Indian conscious of his own rights. The Mexican Revolution and world reaction to the disclosure of conditions in Putumayo hastened action in Latin America in the interest of the native. Papal pronouncements stimulated Catholic action, which, however, has been attacked by anticlericals and by individuals who feel that it is based too much on an ethical appeal. In Bolivia a Catholic pro-Indio campaign in 1926 was defeated largely by anticlericals.

The movement on behalf of the Indian crystallized in the formation of societies for the protection of indigenes, as in Chile, Argentina and Peru where the chief accomplishment of the *Asociación Pro-Indígena* (1909-17) seems to have been the stimulus given to the Indians to organize themselves. An increasing number

of studies of native organization, psychology and economic life have sought to evaluate the Indian's aptitudes and to determine those of his social and cultural attributes which might be incorporated into the national civilization. A clearer definition of the objective of education has been attained; generally this does not go far beyond conversion of the Indian into a prosperous agriculturist or craftsman. Observation of the effects of assimilative legislation, reinforced by general tendencies in anthropological studies, has developed the conviction that the Indians need special laws, that the communities serve as a defense against the landowners and that they must not be transformed abruptly. An extreme view is held by Marxists, like the Peruvian J. C. Mariátegui (*q.v.*) who sought the establishment of a collectivist state based on the communal system. State action adopted with a view to solving the native problem has been for the most part reformist and educational. Special governmental protective agencies, which had disappeared after the end of the colonial era or had been revived largely in connection with the disposal of lands, were given a greatly increased scope, including the proposal and enforcement of legislation and the protection of native interests, especially in labor contracts. General social and labor legislation, including the abolition of peonage, has been widespread. Ambulatory schools and institutions for agricultural training have been adopted from other countries; in Peru certain Indians have established schools on their own initiative. Nationals have finally been accorded equally liberal treatment with foreigners in regard to land settlement.

The question of settlement is linked with the problem of missions. The desire to use the mission for the effective occupation of disputed frontier regions has been operative in Colombia, where beginning about 1890 the long conservative domination opened a field for various orders and subsidized them, and in Venezuela, where a law for mission colonization was passed in 1915. In countries where religious strife has been less acute or has decreased in significance missions have received some encouragement also. In 1900 Argentina granted lands to Catholic missions in the territories of Chaco and Formosa; Argentinian officials, however, do not greatly favor missions. Catholic missions exist in Ecuador, Peru, Bolivia, Paraguay and Brazil; but while they do important work in several places, their scope is very small as compared

with the colonial era and they have rarely been given the powers they possessed at that time. With the abatement of religious intolerance various countries have been opened to Protestant missionaries. The oldest and most important evangelical organization is the South American Missionary Society, a Church of England group founded in 1844; it became established in Paraguay in 1890, and the government subsequently recognized its Chaco mission as the official representative; it entered Araucania in 1895, the Argentinian Chaco in 1911 and Bolivia in 1926. The most successful enterprise is probably the Seventh-Day Adventist Mission to the Indians of Peru and Bolivia, which has established numerous schools and aroused the aborigines to demand their rights. Although the Protestant missions have received some government backing, they have lacked financial resources and sufficient personnel and have accomplished relatively little.

Critics of the various steps taken on behalf of the Indian point out that he is unable to take advantage of educational opportunities or to avoid oppression and enslavement as long as the system of latifundia deprives him of access to the ownership of the land. Hence they hold that the Indian problem and the land problem are identical and that the haciendas must be divided. Generally very little has been done in this direction.

Modern methods of dealing with the natives have received greatest application in Mexico, where there are some 6,000,000 Indians of almost every degree of civilization, with strong local loyalties and speaking ten or twelve different languages which may be further subdivided into numerous dialects. About 2,000,000 speak no Spanish; as in neighboring Central America, the number whose mode of life is Indian far exceeds the number of pure blooded natives. Under Díaz, when the country underwent considerable industrialization, the land and labor policies of the dictatorship together with the despotic centralization carried the oppression of the Indian to extremes. In Sonora the officials embarked upon a brutal policy of exterminating the stubborn Yaqui. The revolution which began in 1910 was, like earlier revolts, an uprising of the mestizo and Indian classes as well as an attack upon foreign domination, and the development of Indian consciousness became a distinct objective of the revolutionary leaders. Not only were sweeping labor reforms enacted and the land system reformed

but the movement for popular instruction, begun under Alvaro Obregón, fostered the teaching of Spanish and the development of native culture while linking education with immediate economic betterment. The anthropologist Manuel Gamio, the author of *Forjando patria* (Mexico 1916), developed and applied experimentally the theory of "integral" education, according to which only instruction applied to the whole community and embracing its entire mode of life would suffice in Indian Mexico; the characteristics and products of each region must be studied as a basis for its education policy. Gamio's scheme was applied only in part. Under Calles the so-called cultural mission achieved a considerable development; it comprises a group of specialists who devote a number of weeks in a given region to training local teachers and furnishing special instruction in hygiene, music, art, agricultural and industrial pursuits. A great number of rural schools were founded, and although there was some opposition, the villages cooperated enthusiastically. In Mexico city there was established a school for Indian boys, who are expected to return to their native communities. Carleton Beals in 1931 summarized the accomplishments of the revolution as follows: "Since 1910 the Indian population has been taken out of serfdom . . . ; two thirds of the Indians . . . now live in free villages. Probably 800,000 heads of families have received land. . . . A very small minority has also been helped by rural credits. Probably a fourth of the Indian population is in touch with some autonomous peasant organization. Probably between a fourth and a fifth of the Indian school population has access to educational opportunities. Educational contacts of one sort and another probably influence many more." The advance in agrarian reform seems, however, to have been checked and the vicissitudes of politics and the necessity of presenting a united nationality against the outside world have led to a suppression of the autonomist aspirations of certain Indian groups.

Of the five Central American countries only in Guatemala do the Indians, numbering over 1,000,000, remain a distinct racial group speaking variegated tongues. Ever docile agriculturists, they are subjected to forced labor recruitments and to the system of peonage, which finds in Guatemala its last stronghold.

Next to Mexico and Guatemala the Andean countries have the largest centers of Indian population. The great majority of these Indians are

communal mountain dwellers, but there are also wild aborigines in the eastern lowlands. In Peru action was taken in 1909 against the complicity of officials in the imposition of forced labor; in 1916 legislation was enacted against peonage and for a minimum wage. Definite abandonment of the long established assimilative policy came with the incorporation into the constitution of 1920 of declarations that the state would enact special laws for the betterment of the native race and that it recognizes the legal existence of Indian communities, whose property is inalienable by ordinary procedure. In 1921 a Section of Native Affairs was created to suggest and enforce protective legislation. A directory for indigenous education also has been established and a weak attempt to improve education has led to the introduction of ambulatory, boarding and farm schools. Protective legislation is not fully enforced, however; the Indians still form the rank and file of army conscripts, and the *corvée* was reestablished in 1920. Peru, Ecuador and Bolivia lag far behind Mexico.

Among the countries of the Amazon basin Brazil is distinguished by its native policy. During the imperial period the Indians benefited by wise legislation but only on a small scale, particularly because of lack of adequate means of communication. In 1831 the Indians in servitude were ordered liberated; the natives were given over to the judges of orphans, who were to place them where they might earn wages or learn crafts. A comprehensive plan for the government of the Indians and the peaceful reduction of nomadic tribes was adopted in 1845. The emperor appointed for each province a director general of Indians, who was to act as a legal representative, guard against forced labor, promote intermarriage and the voluntary acceptance of Catholic instruction, provide necessary assistance in the form of housing, tools, clothing and medicine and base his policies upon the study of the aptitudes and inclinations of the Indians and the resources of the locality. Individual natives were given the right to acquire title to land outside of reservations. In the first two decades of the republic practically all protection disappeared. The natives became the prey of rubber exploiters, who organized raids to recruit forced labor, and of the armed forces sent out by colonization and construction enterprises, whose advance was blocked by savage tribes. Finally, a spirit of humanitarianism combined with anthropological interest and a certain sense of nationalism, manifested especially in a

demand for the placing of nationals on terms of equality with foreigners, led to the establishment in 1910 of the Federal Service for the Protection of Indians and the Settlement of National Workers. The enabling legislation, which resembles considerably the decree of 1845, requires that the customs and internal organization of the natives be respected, holds up the restitution of usurped lands as an objective, although the natives have only the usufruct of their lands, and entitles all Indians to assistance, including the inhabitants of civilized centers. By 1923 the Indian service had settled nomadic, recalcitrant groups of indigenes on thirty-one reservations and had taken over four older reductions, while incidentally it had done much toward colonizing and pacifying various sections of the interior. Its objective is to provide incentives for the native to take up a civilized life, become a rural worker and learn the national language. It guards carefully against the taking of life in the process of Indian pacification. Although it has won widespread approbation abroad, it is handicapped by the opposition of land grabbers and politicians and by the lack of support of state governments. Its budget is far smaller proportionately than were similar expenditures under the empire. In the other countries of the Amazon basin conditions although better than formerly are far worse than in Brazil.

In recent years the Araucanians of Chile have undergone a renaissance. This is to be credited to the work of the protector of the natives, whose office was established in 1866, and of the missionaries, especially the German Capuchins, who have been in Araucania since 1896; service in the army; contacts with the general population in the north; and especially the national attitude which prizes possession of the supposedly manly Araucanian blood. Increasing emphasis is given to industrial and agricultural training, while the Spanish and Araucanian languages also are taught. The Indians have learned to organize to protect their property and they are said to entertain aspirations toward autonomy. In order to end internal strife and to foster productivity and assimilation legislation was enacted in 1927 with the object of individualizing land tenure; Indians with a certain amount of education are authorized to alienate their land freely. In 1928 there were 3278 reserves involving a population of 80,661, but it is estimated that no more than 20,000 indigenes live in isolation.

In Argentina, although Indian blood is more prevalent than is usually admitted, the racial attitude is different and the condition of the Araucanians is less favorable. Their reservations situated in the south are few and scattered and the land is not always of good quality and is usually overpopulated. Nevertheless, the erstwhile pampas Indians are likewise being assimilated and arouse less interest than the natives of the Chaco, who are transported back and forth to the northern sugar plantations in Jujuy and Salta. Land for the latter has been given to but one or two chiefs and missions. The chief problems are connected with labor. The equalitarian tendencies of the country have checked attempts of officials to secure the establishment of a code of special Indian labor legislation.

JOSÉ OTS Y CAPDEQUI

NORTH AMERICA. In the study of native policy it is expedient to distinguish from Latin America that part of North America north of Mexico. The Indian policy of the other European nations in North America can best be understood in contrast to that of Spain, as exemplified in Spanish policy in the areas north of the Rio Grande as well as south of it.

In the territory now covered by the United States, in regions formerly under Spanish control, slavery and forced labor, which had been so important farther south, were applied only on a small scale. The mission technique predominated (*see* section on **LATIN AMERICA**). In the peninsula and panhandle areas of what is now Florida and on the coast of what is now Georgia and South Carolina most of the native tribes were, well before 1700, resident in mission villages under the economic, social and religious tuition of Spanish missionaries. In California the first mission was established at San Diego in 1769, the last in San Francisco in 1823; by 1834 some 30,000 Indians were settled in over twenty missions. Missions flourished also in Texas.

Beginning about 1680 the British colonists of Carolina, assisted by Creek and other Indian allies, completely destroyed the Spanish missions in the southeast. The civilized mission Indians were killed, taken captive and sold into slavery or otherwise dispersed. The young Mexican government, engaged in a struggle with the church, decreed the secularization of the missions in California in 1833 and 1834, driving out the missionaries; the result was

the disintegration of the missions in that area. The Indians either died off or returned to a more primitive way of life as marauders. When Texas seceded from Mexico in 1836 it secularized the missions, which disappeared as important Indian agencies.

Aside from the Spanish missions the mission policy was employed on a noteworthy scale in North America only by the French in what is now the province of Ontario. From about 1635 to 1645 the French Jesuits achieved some initial success there among the 30,000 Hurons. Beginning about 1645, however, and especially in 1648-49 these Hurons were nearly exterminated by the Iroquois, who had acquired firearms from the Dutch fur traders of New Netherland and, with the gradual exhaustion of their own fur supply, sought the Huron country as a fur hunting ground.

The fundamental distinction between the Spanish policy and that followed by other nations in North America lies in the fact that the Spaniards rarely treated with the Indian tribes as though these possessed any collective sovereign rights. Except where the Indian tribes were used as allies against a strong rival, such as the United States, as in the case of the Spanish treaties of 1784 with the Creeks, Choc-taw and Chickasaw, subjection to the Spanish crown was insisted upon. The Indians became subjects of the Spanish crown only as individuals. Although in practise the representatives of Spain frequently utilized the existing Indian tribe as an administrative unit, making it the basis of a municipality or other organ of local government, it was always as a branch of the Spanish government and not by way of recognition of the continued sovereignty of the Indian tribes. Supreme authority was vested in the representatives of the crown. There was no purchase of Indian lands or other rights (*see* **LAND GRANTS**, section on **LATIN AMERICA**). All the former national or tribal domains of the erstwhile sovereign Indian people became crown property.

The earliest British colonies (Roanoke about 1585 and Jamestown, Virginia, 1607) did not consciously diverge from the Spanish policy, with which they were well acquainted. The colonists were "planted" not by the British crown, but by entrepreneurs to whom the crown had granted rights of colonization (*see* **CHARTERED COMPANIES**). For a time conquest of the Indians and their economic assimilation under a forced labor system was under consideration, but North

American enterprise never gave promise of great profits; it therefore never attracted enough capital to make practicable the actual subjugation of the Indians, involving considerable outlay which would yield dividends only after a long time. Although the first British entrepreneurs in North America were cautious as regards expenditures, their heavy losses suggest that they followed the wrong policy. The alternative adopted was to treat with the Indian tribes as sovereign nations. Land for settlement was acquired from the Indians by cession through formal treaty. In the earliest period cession followed as a result of defeat in war but later as a result of purchase from the Indians, who because of the advantages of trade with the colonists were in the beginning glad to have small groups of whites settle among them.

The earliest French colonization contemporaneous with that of the English in Virginia was also under the direction of a trading company. In this case, however, the interest was chiefly in the fur trade rather than in the cultivation of crops for export. Here too the management was conservative with regard to expenditures and was likewise obliged to treat with the Indian tribes as sovereign nations and to receive from the Indians land for forts and settlement by cession, which did not always, however, involve purchase. The Dutch and Swedes on the Atlantic coast in the first half of the seventeenth century followed policies very much like those of the British as a result of the same sort of financial conditions and with similar consequences to themselves and to the natives.

The Dutch in acquiring land by cession from the Indians followed a somewhat different procedure; they retained all the European formalities of land transfer, including the use of properly attested and signed parchment deeds. The Dutch West India Company, which controlled New Netherland, required that a deed of transfer from Indian owners be acquired by prospective settlers but refused to recognize the settler's right to the land without approval by the company. This practise, initiated in 1626 with the purchase of Manhattan, was probably intended to challenge English claims to exclusive right to trade and settle in areas in which the Dutch were intruding. Since the English treated the Indian tribes as sovereign, consistency demanded that they recognize deeds transferring lands from the Indians. The Swedes in Delaware and the New Englanders on the Connecti-

cut River succumbed to the strategy of the Dutch. In New England, however, the practise at first had no legal sanction, since these colonies, while they found it expedient to recognize Indian sovereignty, would not officially recognize Indian title to Indian lands. Later, in the 1640's, under the sentimental and politically heretical Roger Williams the practise became widespread in New England and gradually received the official sanction of the New England colonies. In the 1650's it was adopted in Virginia and Maryland.

Interminable wrangling over Indian deeds of transfer ensued. Established merely as a device whereby colonial rivals could concoct new legal quibbles over colonial rights pending the resolution of the entire conflict by European war, such deeds became a part of British policy through the pressure of sentimental elements. The procedure was never adopted by the French, who did not need such an intercolonial bargaining device and did not pretend that their recognition of Indian sovereignty was prompted by anything but financial expediency.

The English and American attitude, as subsequently explained in the cases of *Fletcher v. Peck*, 10 U. S. 87 (1810) and *Johnson and Graham's Lessee v. McIntosh*, 21 U. S. 543 (1823), was based upon the principle that discovery gave title to the government by whose subjects or authority the discovery was made but that this title was subject to the Indians' perpetual right of occupancy. This right of occupancy was to be respected while the Indians were in possession of the land, although they were incapable of transferring absolute title.

While Russian colonization in Alaska in the late eighteenth and the early nineteenth century also was carried on through a private company—the Russian-American Company—treaties were not employed nor was the policy one of pushing a segregated Indian people farther and farther into the wilderness. The policy varied according to whether the Indians were classed as settled or wild. Over the latter the company exercised little control, merely attempting to obtain the best possible trading terms from them. The settled natives, however, were considered Russian subjects with a distinct status; they were subject to Russian laws and entitled to Russian protection, but they were not required to pay taxes or tribute. They were governed by their own chiefs but subject to company control. These natives were utilized in the otter hunt, which was the principal activity

and source of revenue of the settlements. The native hunters were furnished with supplies and equipment by the company; they hunted under the direction of a Russian foreman and they shared their catch with the company. Their own portion was sold to the company at a set price which governed not only their pelts but those of the Russian settlers as well; they were paid not in money but in credit at the company stores. Considerable opportunity was afforded them of achieving equal status with the Russians, and some of the natives and hybrids were sent to Russia to be educated.

One of the important elements of friction in the problem of Indian-white relations in North America was the treaty system, which assumed a sovereignty and a control of subjects and groups that existed neither among the Indians nor among the whites. Under the customary loose organization of the Indians no single central body would act for the entire nation; only those who had actually participated in the signing of a treaty and in the distribution of presents considered themselves bound by its terms. Clashes were often due to claims by groups of Indians that those who actually signed the disputed treaties had no authority to commit the nation as a whole. As a result of the recognition of Indian sovereignty whites were generally restrained from entering Indian territory and Indians from entering white territory without actual passports or other express permission. Traffic through Indian territory was possible only by acquiring from the Indians formal rights to pass over certain routes. There was as a rule no authority among the Indians which could punish violations of treaties. On the part of the colonies too attempts to prevent intrusion by whites into territory guaranteed to the Indians proved vain. Even where troops were used to force squatters back to the established frontier, the check proved only temporary.

Another frictional factor in North America, as elsewhere in the relations between peoples in different stages of economic development, was the lack of a common standard of value. The prohibition upon the sale of land by Indians to individual whites had a rational justification in that the Indians were unable to comprehend values in terms of the white economic system and were willing to part with their land and furs for trifles. Regulation of trade between whites and Indians was necessary not only to assure additional revenue to the colony or mother country but also to protect the Indian

against unscrupulous and overreaching traders, whose practises affected the Indian attitude toward all whites. Accordingly trading with the Indians was generally either a monopoly of the colony or of some private corporation or could be carried on only by licensed and bonded traders. Such stipulations were generally incorporated in the treaties with the Indians.

The treaties were renewed frequently, generally every year in accordance with Indian practise, which also required the exchange of presents of about equivalent value on the occasion of the renewal. But because the military assistance of the Indian was sought in inter-colonial wars, the white colonial ambassadors instituted the custom of accepting only a nominal formal gift from the Indians while giving them considerable presents of ammunition, spiritous liquors, hatchets, hoes and various other articles. Serving as pawns in the struggle for imperial domination in North America, the Indians demanded greater and greater rewards for their alliance and services.

As war, disease and liquor made inroads upon the Indian population, the dwindling tribes sold their territories bit by bit to the white invaders. Lands which one year were guaranteed to the Indians in perpetuity were the next year demanded of them for a consideration. The little remaining tribal property became isolated from similar Indian enclaves. Finally the tribe, reduced to a few hundred on just enough land to support it, its military strength no longer either valuable or dangerous to the whites, came to be looked upon as a charge or ward of the colony. It was prohibited from alienating its remaining lands without colonial authorization and was forced to agree to trade only with individuals licensed by the particular colonial government. After the American Revolution there developed the practise of reserving the sums credited to the Indians for lands sold, the Indians being given an annuity from the fund in addition to the annual treaty payment.

The sadly diminished, isolated enclave of Indians became popularly and later officially called a reservation. Essentially a reservation is any area of land which with its inhabitants is set apart from the encircling dominant community, with definite territorial boundaries within which there exist special laws and customs for the inhabitants. Reservations have been typical phenomena of many an Old World cultural and racial frontier. They have evolved

in each case as a consequence of the clash of cultures subjected to a control leading to segregation (*q.v.*) of the weaker group. So long as large areas in North America remained inhabited exclusively by large tribes of Indians, the process of forming Indian reservations continued, a result of the constant pressure of organized white population against the Indian borderlands and the continuation of the old colonial Indian policy.

Before 1754 each of the various British colonies had assumed management of its own Indian affairs; in that year war with France brought the British military forces on the colonial frontiers to the realization that while the direction of the Indian allies of the French was efficiently centralized, the British tribal allies were allies not of the crown and its forces but, in each case, of some particular colony. By hasty and impromptu measures the crown through its military organization took over from the several colonies the control of relations with the Indians on the frontier. A superintendent of Indian affairs was appointed to deal directly with the Indian tribes. The old decayed coastal reservation tribes were still for the most part left in the charge of the several colonies.

With peace established in 1763, the British crown in its famous proclamation of that year made permanent its control of Indian affairs. The colonies were restricted to the territory east of the Appalachian divide, all the territory to the west of it being reserved to the Indians. The Indian territory was divided into a northern and a southern district with a superintendent for each. Aside from unification of the management of Indian relations there were minor modifications but no fundamental change in Indian policy.

The crown sought to check the tendency of the poorer classes of agriculturists to press upon the solid line of the established Indian frontier. There was considerable land for sale even in the area of old settlement but at a price which many were unable to meet, while beyond the frontier there was rich land which a decreasing Indian population with aboriginal techniques could not cultivate. The impoverished whites were anxious to secure land in this territory—through acquisition and subsequent grants by the crown, through forcible seizure to be followed by legal recognition or through direct purchase from the Indians and legal recognition of title.

These conflicts over the Indian land problem had existed from the early seventeenth century in each of the separate colonies, the colonial government being antagonistic to the poorer frontiersmen and constantly interfering in quarrels between them and the Indians in favor of the latter. Neither the colonies nor the crown found it advisable to change the policy of acquiring and granting new Indian lands. Effective maintenance of the status quo, it was held, would decrease quarrels and crime incident to the mingling of Indians and the rougher elements on the frontier; tend to preserve the friendship of the Indians and make unnecessary expensive wars against them; keep up the productivity and profits of the fur trade beyond the frontier; permit more effective political, social and economic control of the outer edges of the colonial settlements; and reserve the frontier lands in Indian possession until the westward movement of relatively dense white population would enable the government to sell the lands to prospective settlers at a profit after acquiring them at its own price from the remaining Indians. In practice, however, the policy merely intensified the hatred of the frontier whites toward the Indians, a hatred expressed in murders and resulting in Indian wars, while the government was constantly forced to buy new Indian lands for disposition to the frontiersmen.

Under the Articles of Confederation (1777) Congress was given exclusive power of "regulating the trade and managing all affairs with the Indians, not members of any of the states, provided that the legislative right of any state within its own limits be not infringed or violated." The confederation made no material modifications of policy, but in a treaty with the Delawares in 1778 it gave the Indians the right to send delegates to the Congress if they chose. Thus was initiated the idea of an Indian state in the union, a proposal which was given some consideration by Jefferson and which was repeatedly advocated for over a century.

The constitution of 1789 gave the federal government exclusive power "to regulate commerce . . . with the Indian tribes." In an effort to restrict the evils of private trading the United States in 1792 adopted the principle of direct government trading with the Indians. It was some time, however, before these government trading houses actually were established. In 1806 provision was made for a superintendent of Indian trade to serve as a permanent central

directing agent for government trade with the Indians. Persistent opposition by private trading interests resulted in the abolition of this office in 1822, but two years later the Bureau of Indian Affairs was established. In 1832 a commissioner of Indian Affairs was appointed to take charge of all matters arising out of relations with the Indians, and in 1834 the Department of Indian Affairs was organized as a subsidiary of the Department of War. The Indian bureau was transferred to the Department of the Interior upon its establishment in 1849.

Pursuing in general the policy which had been followed by the crown and the confederation with reference to extension of the frontier, the federal government soon found that the desire for land on the part of the frontiersman was still unappeased. Particularly with the acquisition of the Louisiana Purchase in 1803, those southern states on the borders of which lived powerful Indian tribes whose lands were sought by the frontier whites insisted that the federal government either liquidate the tribal governments and acquire their territories or remove these tribes to new regions west of the Mississippi. The idea of removing the Indians apparently originated with Jefferson in connection with the Louisiana Purchase. Under Monroe and Adams the federal government insisted that removal could take place only with the voluntary consent of the Indians. The Indians were approached on this basis; but the principal tribes concerned, the Choctaw, Creeks, Seminole and Cherokee, refused. Several states then threatened to defy the federal government, to take charge of Indian affairs within their own borders, to dissolve the tribal governments and to confiscate all Indian lands except those needed by the Indians for sustenance. The hatred bred on the frontier had given rise to the application of color prejudice against the Indians, and it was planned to subject the tribesmen to the legal disabilities imposed upon Negro freedmen. As early as 1794 a Tennessee law provided that no Indian could be a competent witness in court against a white man. Without federal interference Mississippi in 1830 dissolved the tribal governments of the Chickasaw and Choctaw within the state, but this affected few Indians. Alabama in 1820, 1821 and 1829 and Florida in 1831 extended their civil and criminal jurisdiction to the few Indians remaining within their boundaries. Tennessee and Texas (both as republic and state) likewise rid themselves of Indians and tribal govern-

ment. The Choctaw, Chickasaw and Creeks yielded and most of them moved west.

The Cherokee, however, except for a small group which voluntarily and unofficially migrated to western lands, refused to leave Georgia. Between 1806 and 1827 they effected a modification of their already excellent native form of government into a form patterned after that of the white American. Georgia legislation of 1828 and 1829 refused to recognize the remodeled Cherokee confederation, declared Cherokee lands the public domain of the state, to be distributed to white and Indian alike, and provided that the Indians were to become individual subjects of the state, with certain disabilities such as attached to freed Negroes. The Cherokee nation sought an injunction against the enforcement of these measures; but the Supreme Court held [*Cherokee Nation v. Georgia*, 30 U. S. 1 (1831)] that the Cherokee nation, being a dependent domestic nation and not an independent foreign nation, could not maintain a suit against a state in the Supreme Court. The following year, however, in a suit involving a white missionary [*Worcester v. Georgia*, 31 U. S. 515 (1832)] the laws of Georgia breaking up the tribal organization were held illegal. Jackson, a frontiersman whose election to the presidency changed the executive attitude to one favoring forcible removal, thereupon nullified the decision by refusing to enforce it. With no other recourse, the Cherokee in 1835 agreed to move west within two years. At the end of that period most of them had not yet moved. Federal troops thereupon rounded up and forcibly moved thousands of Cherokee, causing great loss of property and life. In the fall of 1837 the remainder of the tribe—about 12,000—accepted the inevitable and moved to the Indian Territory. About 4000, representing approximately one fourth of the tribal strength, died in the course of the various removals. The Seminole were nearly all moved west by 1842, but only after a war lasting nearly eight years.

Northwest of the Ohio the power of the tribes had been broken at the battle of Tippecanoe in 1811. Furthermore as a result of the War of 1812 the United States was able to expel from this region English fur traders, who had constantly encouraged the Indians to hope that they would be able to resist the advance of American agricultural settlement. On its own initiative the federal government began to plan the westward removal of these Ohio valley and Great Lakes tribes, including immigrant Seneca,

Delaware and Shawnee. There was mild resistance on the part of the Kickapoo and of the Sauk, Foxes and Winnebago under Chief Black Hawk in 1832, but before 1840 most of the northwest tribes had gone west.

With the removal completed, the welfare of the Indian received little consideration until the late 1860's. The problem persisted throughout this period; but the expanding west was hostile to the Indian, while the now remote east was indifferent and increasingly absorbed in the problem of slavery.

Just as previous boundary lines had had to give way before the irresistible pressure of the frontiersman, the great preserve in the western part of the old Louisiana Purchase which the United States had set apart as a solid Indian territory in 1834 was broken up beginning in 1853. In the next few years a great many treaties were made extinguishing Indian title to certain lands. During the Civil War the slaveholding Indians, the tribes which had been expelled in the 1820's and 1830's on the demand of the southern states, fought on the Confederate side. In addition wild tribes to the north and west also went on the warpath. With the Civil War over, the United States penalized the Oklahoma tribes by obliging them to sell great tracts of land which they owned but did not have sufficient population to occupy. Into the territory so obtained the Cheyenne, Arapaho, Kiowa, Comanche, Sauk, Foxes, Pawnee, Iowa, Kickapoo, Shawnee, Potawatomi, Ponca, Wichita, Oto, Missouri, Delawares and other tribes were forced to move.

Investigations of the Indian service in the late 1860's, largely a result of the rise of a strong humanitarian interest in the Indian, revealed that inefficiency and corruption were then, as before and since, widely prevalent. A number of changes in Indian policy and organization resulted. As a check on the bureaucracy the Board of Indian Commissioners was set up in 1869; it was to consist of ten men who were to serve without pay and to have joint control with the secretary of the Interior over the disbursement of the Indian appropriation. Legislation in the next few years, however, made its powers almost entirely advisory. The appropriation for Indian education was greatly increased in 1870. Realization of the inexpediency of treating the Indian tribes as self-governing entities led in 1871 to the abandonment of the policy of regulating Indian affairs by treaty, in favor of that of congressional legislation and

simple agreements, although existing treaties were not thereby impaired.

The sovereignty of the tribes, however, had already been impaired by the legislation of 1834 which extended the federal criminal laws to crimes on tribal territory where a non-Indian was the criminal or victim. In 1885 the United States assumed the right to exercise criminal jurisdiction in cases involving any of eight specific major crimes committed on Indian territory, even when the crime was of Indian against Indian. In 1932 two more crimes were added to this list. The states had jurisdiction in cases of offenses committed by Indians outside the bounds of the reservation. Other jurisdiction was left to the tribal government. Where, however, the tribal government had disintegrated, as was frequently the case, courts of Indian Offenses were set up. These courts are usually composed of three Indian judges, appointed and removable by the superintendent in charge of the reservation; they mete out justice theoretically according to a general code set forth by the Bureau of Indian Affairs in 1904 but actually almost entirely according to the dictates of their common sense. These courts have been criticized considerably, but their principal fault seems to be not that they are too harsh but that they are unable to control habitual malefactors. Marriage and divorce are governed by Indian custom.

With the abandonment of treaty making, the reservation system remained the dominant characteristic of American Indian policy. Its essential features were an emphasis on segregation and guardianship, with land communally owned but administered by the Indian bureau, which had the power to lease timber and mineral lands for the benefit of the tribe. The income from these leases, treaty payments and other annuities was distributed among the individual members of the tribe or placed in a tribal fund from which expenditures were made for communal purposes, such as education. In order to provide for the Indians in the early years of their settlement in the reservation and in an attempt to make them more contented with their lot rations were provided for them, at first for a limited time but later until they were capable of self-support. Under this arrangement the more warlike and potentially dangerous the tribe, the larger its allotment of rations was likely to be. The administration of tribal property was characterized by considerable laxness and corruption: leases were often made at highly

disadvantageous terms and tribal funds were frequently expended for improvements which were of little or no benefit to the Indians. Government appropriations for the Indian were often wasted or stolen.

Increasing evidence that the reservation system was pauperizing the Indian without making him any better adjusted to the prevailing economic system led in 1887 to the passage of the Dawes Act, which provided that individual Indians might receive a "trust patent" from the government for an allotment of land on the tribal reservation and that at the end of a twenty-five-year trust period full control of the land would pass to the individual Indian. Citizenship in the United States, theretofore denied Indians even though they had left their tribes [*Elk v. Wilkins*, 112 U. S. 94 (1884)], was to follow automatically upon the grant of the trust patent. The Burke Act of 1906 facilitated the grant of full control by providing that the trust period might be shortened if the Indian was able to manage his own property; it hindered the grant of citizenship, however, by setting up the achievement of ownership in fee as a prerequisite to citizenship. During the World War many non-citizen Indians fought in the United States army, and a law of 1919 conferred citizenship on all honorably discharged soldiers who asked for the privilege. In 1924 an act of Congress declared all non-citizen Indians born in the United States to be citizens; prior to this act, however, about two thirds of the Indians had already become citizens under the general allotment act or under various special acts.

Grant of citizenship has not carried with it the right to vote, which is regulated by the respective states in which the Indians live. Reservation Indians in the southwest, for example, are barred from voting on the ground that they are not taxpayers, reservation lands and lands held in trust by the United States having been held not taxable by local authorities [*United States v. Rickert*, 188 U. S. 432 (1902)]. In Arizona the Indians are barred from voting because the state law provides that persons under guardianship may not vote.

It has thus far proved an almost impossible task to educate the Indian population, primarily because of the diversity of views with regard to the proper aim of such education and because of the impracticability of the schemes of education adopted. In the earliest period Indian children were often permitted to attend school

with the whites; but as hostility between the two races increased, this became less and less common. One of the most potent forces for education of the Indians in colonial times was the work of the various missionaries. But they soon discovered that their efforts were futile because the Indian possessed no outlet for the type of education thus provided. Unadapted as yet to the white man's economic system, he tended to discard his education on returning to his tribe.

Little was done by the United States government in the matter of educating the Indians until 1819, when an annual appropriation of \$10,000 was provided for industrial and scholastic education. Since the government had no educational machinery, it distributed the money among the missionary societies, which later also received money from the treaty funds as well. In 1870 the development of an educational system under direct government administration was initiated. Toward the end of the 1870's the non-reservation boarding school was developed; the first one exclusively for Indians, situated at Carlisle, Pennsylvania, offered academic and industrial courses. This type of school quickly became the ideal in the Indian educational system, since it offered the greatest advantages to the white staff with regard to both their own comfort and their ability to control the Indian students. It soon developed obvious weaknesses, however. No provision whatsoever was made for the students returning to the reservation. With no economic opportunities available there and no particular training for the white economic world, they became either drifters or casual laborers performing the lowest types of manual work under the most degrading conditions. More recently, particularly since the report of the Meriam committee in 1928, the tendency, especially as regards the younger children, has been toward a system of day schools on the reservations or toward their education in the state public schools, the federal government paying the state a definite sum for each Indian student.

A critical summary of North American Indian policy must conclude that that followed by the United States has been a decided failure from any but the most rabid anti-Indian point of view. After over three centuries of contact the handful of Indians who remain in America today are still to a large extent culturally unassimilated. From a population which before the coming of Columbus numbered perhaps

3,000,000 the Indians of what is now the United States have decreased to some 350,000 at the most liberal estimate, which includes all those who possess any Indian blood whatsoever. Even now only about one third of the Indians are outside the jurisdiction of the Indian office, half of the remainder comprising unallotted Indians and the other half those whose allotment is still held in trust by the government. As recently as 1928 a report prepared by the Institute of Government Research under the direction of Lewis Meriam found that, aside from a few Osage and other Indians who had become wealthy through the discovery of oil on their reservation lands, the income of the typical Indian family was low and the earned income, as distinct from that which came from government grant or rations, extremely low. Only 2 percent of the Indians had incomes of over \$500 a year. Partly as a result of this poverty the health of the Indians in comparison with the rest of the population was bad. The death rate and infant mortality rate were high. Tuberculosis and trachoma were extremely prevalent. Living and housing conditions were appalling; diet was poor; sanitary provisions were generally lacking. The system of public health administration and relief work was inadequate. The educational system had no well considered broad educational policy. A uniform curriculum was being applied throughout the Indian school system, although the different tribes were at quite different stages of development. Indian children were being fed at reservation schools on an average expenditure of eleven cents a day per child and were being forced to do heavy domestic work actually to ease the financial burden but ostensibly to acquire training in useful industrial arts. The Indian Bureau was found to be below a reasonable standard of efficiency because of inadequate funds, low salaries, rapid turnover, incompetence, bad living conditions and the political nature of the appointments to some of the more important positions.

The report and a subsequent senatorial investigation which gathered corroborative evidence from 1929 to 1932 stimulated a reorganization of the Indian service. As a result of the revelations appropriations for the Indian service were increased considerably, amounting (including appropriations from tribal funds) to \$29,000,000 for 1932 and to \$24,200,000 for 1933. The most important factor, however, is the efficiency and spirit of the administration; this

in turn is largely dependent upon the men who head it. Recently there has been inaugurated a policy of appointing to these offices persons who have shown a definite interest in the Indians, and the administration of Indian affairs may therefore become somewhat more efficient and constructive. The work of various organizations interested in the welfare of the Indians, such as the Indian Rights Association organized in 1882, and the various Indian defense associations has helped in arousing public interest to the necessity for a change in treatment.

In Canada, until about 1830, the British crown retained its purely military administration designed to keep the Indians in peaceful alliance with Great Britain. By the Articles of Capitulation of 1760 the half dozen remaining French reservations were recognized by the British; they remained under the influence of the Catholic clergy. In the newer area of Upper Canada, however, the practise of extinguishing Indian title in accordance with the Proclamation of 1763 and of setting aside reserves was followed consistently.

With the elimination of the Indian menace and the propaganda of mission organizations and of the Aborigines Protection Society in the mother country, the British began to follow a policy of active education and assimilation. In the period between 1830 and 1867 the foundations of Indian policy as it still prevails were developed in eastern Canada: administration was transferred to the local authorities; a system of educational grants to religious denominations was adopted; the costly presents system was supplanted by the bestowal of useful implements; land was set aside by public authorities or private enterprise for the landless natives in the Maritime Provinces; and location tickets granting individual rights of occupancy were inaugurated for Indians on the reserves.

In British Columbia, established as a crown colony in 1858, aboriginal title was not extinguished, the natives being granted whatever land they had improved. They formed small communities of one or a few families scattered throughout the province in proximity to white settlements. Although some measures were taken to relieve distress and suppress drunkenness and although the Indians were granted legal protection and certain exemptions, practically nothing was done to advance their condition.

The act creating the Dominion of Canada

granted the federal Parliament exclusive power to legislate for Indians and for lands reserved to Indians. Since 1880 the supervision of Indian affairs has been entrusted to a separate department usually under the minister of the Interior. Canadian Indian administration, although charged with similar responsibilities, differs from that of the United States in that it has been marked by an absence of political control and bureaucratic centralization. A greater degree of responsibility is vested in the field staff, which in turn has encouraged greater self-reliance on the part of the Indians.

On the prairies and in the north the government has consistently followed the treaty policy even down to the present day. The provisions have been very similar: the Indians promise to obey the laws of the country, while the government undertakes to allot reserves at the rate of one square mile for each family of five, to provide annuities and agricultural implements and to set up educational facilities. The establishment of control over the western Indians has been peaceable almost without exception. The Hudson's Bay Company had maintained cordial relations with the natives, and missionaries of various denominations who had begun to enter the region about 1820 were also of influence. The Royal North West Mounted Police, who came to the prairie in 1874, imposed respect for law and order upon both colonists and Indians.

In the older provinces the federal government took over the control of the existing reserves and established new ones. In British Columbia the treaty policy was not followed, the allotment of reserves depending upon the joint agreement of the dominion and the province. The natives have expressed dissatisfaction with the size of their reserves and have claimed compensation. In 1926-27 a special committee of the Senate and House of Commons inquired into the claims of the Allied Indian Tribes of British Columbia and the Indian Tribes of the Interior of British Columbia. It concluded that no aboriginal title ever existed, but its recommendation of a special annual grant of \$100,000 for provision of hospitals, medical attention and technical education and for promotion of agriculture, stock raising and irrigation projects was accepted.

The Canadian Indian is a citizen, but his right to vote depends on provincial legislation. Special Indian legislation is fairly flexible, leaving to the discretion of the authorities the

choice of methods appropriate to the various classes of Indians. The legislators have not attempted to break up tribal government, and besides maintaining established systems of rule among less advanced groups they have introduced two types of local self-government. The government, however, retains extensive authority, which may be exercised in default of action by the Indians. In late years this authority has been increased, especially with respect to utilization of the funds of the Indians and the resources of the reserves as well as to individual allotments of land to Indians. But except for very special reasons no reserve lands may be surrendered without the consent of a majority of the males above the age of twenty-one. The authorities have control over Indian devices of real property on reserves and over trade with the Indians. The prohibition of the use and sale of intoxicants is very strictly enforced; infractions may be brought before the local Indian agent, who may try all violations of legislation regarding the Indians. With some important exceptions the officials have not attempted to suppress aboriginal culture and customs. Marriages according to Indian custom have been considered legal, while divorces are held illegal.

The dominion has continued the system of denominational education, and its policy, adopted especially with a view to ending the necessity of rationing the plains Indian, is to equip the native for civilized life in his own environment. Hence there has been an increasing emphasis upon agricultural training. While boarding schools have been regarded with approval, efforts have been made to prevent "relapses" upon return to the reservation. Marriages are arranged between graduates, and the young man is assisted in establishing himself as a farmer. Promising students are materially encouraged to pursue advanced studies. The curricula of the Indian schools follow rather closely those of the other schools in the province, but the department reports that this practice is not altogether suitable. Attendance in recent years has increased rapidly. Certain Indians in the east contributed to educational costs until 1928-29, when Parliament assumed responsibility for the entire appropriation. Of late there has been an extension of health work, but preventive measures have not yet been given sufficient support.

Until recently the process of enfranchisement, or release from special status as an Indian, was

rather tedious and difficult. The loyal participation of the Indians in the World War hastened their enfranchisement, which after 1918 was granted on application to competent Indians not holding land or residing upon a reservation. In 1920, in view of the reluctance of certain Indians to seek enfranchisement because of the tax exemption and protection which their reservation property enjoyed, legislation was enacted permitting enfranchisement by the authorities without the consent of the Indian. This aroused considerable protest, and by legislation of 1922 application by an Indian or a majority of the voters of the band was constituted a necessary preliminary. Since the supplanting of the old legislation the rate of enfranchisement has been greatly accelerated.

A large proportion of the Indians have advanced considerably on the road to economic independence. The Indian population, among whom there has been considerable admixture of white blood, increased from 105,998 in 1917 to 108,012 in 1929. In the older parts of the country and in sections of the west the scale of civilization of the Indians is frequently on a par with that of their white neighbors. In the north the natives have been brought under control comparatively recently and are still largely nomadic. The authorities make no attempt to effect radical changes in their mode of life and are content to obtain for them wide hunting and fishing privileges and special game preserves.

The highly adaptable Eskimo are vital to the economic development of the regions they inhabit. Their chief problems arise from a diminishing food supply and from the introduction of diseases through contact with Europeans. In Greenland missionary activity began in the early part of the eighteenth century, and a government monopoly of trade and administration was established in the latter half. Since then the condition of the Eskimo has slowly improved. They are subjected to special law, which includes aboriginal custom, and have been allowed participation in government. Schooling is provided in the native language. There has been intermarriage and the population is on the increase. In Alaska the Eskimo were threatened with starvation until the government in 1892 imported domesticated reindeer. The natives now own two thirds of the herds. Hospitals and schools have been established; all the children learn some English and the boys are trained in navigation, wireless

operation and the use of motors. Here too the population, containing mixed blood, is increasing. More widely scattered and less accessible, the Canadian Eskimo have been forced to submit to less favorable conditions, although a beginning has been made in improving their situation.

W. C. MACLEOD

THE PACIFIC AND AFRICA. In its earlier stages native policy throughout the Pacific area was determined in the main by three sets of factors: adherence to a regime of *laissez faire*, missionary philanthropy and self-seeking nationalism. The first of these, which may be attributed largely to Great Britain's refusal to assume responsibility, led to beach combing and blackbirding. Partly because Great Britain desired to avoid new overseas responsibilities and partly because of the mission influence from Exeter Hall, the islands of the Pacific were generally assumed to be independent kingdoms in international law; an assumption which resulted inevitably in a sacrifice of the natives and an evasion of responsibility. The best example of the results of such a policy may be studied in the history of the kingdom of Hawaii. Native parliaments and elections led to the appropriately named "Bayonet Constitution" of 1887 and to abuses which necessitated annexation by the United States.

The second factor, missionary influence, began to operate with the voyages of the *Duff* in 1797 and reached its apex in Tahiti, "the missionary kingdom" under the control of the London Missionary Society. Every detail of liberal constitutional paraphernalia was copied, the resultant enfeeblement leading to a French protectorate in 1842. Thus the third influence, self-seeking nationalism, came into prominence, taking the form of a series of raids and annexations, regardless of native rights, as far apart as Tahiti and New Caledonia. This caused a general rush for annexation, in which the danger zone of Samoa opened the door to international intrigue and led to the Berlin Conference of 1889. For somewhat similar reasons Great Britain had to break down the native kingdoms in Tonga, where native self-rule had opened the way to a scheming Australian dictator; in Fiji, where it resulted in the capricious cruelty of Thakombau; and in the New Hebrides, where the earlier policy of *laissez faire* had been conducive to blackbirding and abuses by sandalwood traders.

By 1900 all of the Pacific lands were annexed,

and Derby's phrase about "black subjects enough" was replaced by apostrophes to "the white man's burden." Laissez faire was now discredited as a policy of drift, in which facts were sacrificed to theory and in which the result was chaos. It had failed to train the natives and had led, on the contrary, to a great destruction of native life and to acute depopulation practically everywhere in the Pacific.

Annexation after the 1840's had been accompanied by direct rule, but this, while eliminating some of the earlier evils of irresponsibility, was equally injurious to native culture. Rule by native chiefs was destroyed even in places, like Samoa, where it was highly developed; and the native was allowed to drift in a state of mental and physical despair. The French were the chief sponsors of this policy, for they deliberately set out to break down everything native. They attacked native life *qua* native and made no attempt to modify French practices to the Polynesian or Melanesian environment. As the necessary prelude to ultimate assimilation tribal organizations were smashed in New Caledonia, Tahiti and the Marquesas. Until the reforms of 1906 Germany followed this policy of destructiveness, especially during the company period in the Pacific; while Great Britain, although pursuing no sustained program in this regard, provoked the same results, as is evidenced in the excessive depopulation of Fiji.

By the end of the century only two truths apparently had emerged from the many decades of varied experience: first, that the natives were incapable of developing along the lines of western constitutionalism; and, second, that rule from above in defiance of native customs had failed, even where the aims had been benevolent. Yet some such course as the second seemed to be necessitated by the rapid economic development, especially after the 1870's, when extra-European affairs assumed a new importance and when the cry of "raw materials" began to be raised with increasing intensity. The natives had to conform to the pace set by economic entrepreneurs and be subordinated to a policy of development. Direct rule, conditioned by the economic motive, treated the islanders simply as a detached element in a complex situation and neglected the possibilities of a slow evolutionary development.

With the beginning of the new century, however, the various powers, profiting from the numerous unsatisfactory policies of the past, began to work toward a new native policy. It

was obvious that the native could not progress as long as he was viewed as a mere instrument of production for European factories, and that direct rule made him a means to an end and prevented him from playing a part in his own development. As Sir Hercules Robinson said of the Fijian in 1879, "Nothing is left to be done by him or in his own way." Similarly, such European palliatives as democracy and individualism were seen to be inapplicable, either to highly conventionalized polities, such as the Indo-Chinese and Javanese, or to communalized societies, like those of Polynesia.

The moral was pointed by the ravages of depopulation—a fact which the Germans perceived as they turned in some fields to policies of native regeneration, if only to keep up the efficiency of the natives as copra producers. Thus the realist Theodor Weber respected Samoan customs after 1864 as a matter of good business; later Governor Haber ruled through the chiefs in New Guinea, evolving a system of delegated authority through native *lulus* and *tultuls*—a technique subsequently applied by the Australian mandatories; and Dr. Wilhelm Solf scrupulously kept the self-governing institutions of the Samoans, especially the *fono*, or councils on the basis of the head of the family (*mutai*). In Micronesia the chiefs exercised taxing and other functions under German rule, and this system was extending on the New Guinea mainland at the outbreak of the World War.

Meanwhile in the 1890's Sir William MacGregor, governor of Papua, was going still further and shaping the new ideas into an organized system of government. "Natives first," he proclaimed, as he proceeded to utilize Papuan agents, even turning convicted murderers into village constables on the ground that successful murder under Melanesian conditions required just those qualities which, properly directed, would make the murderer an ideal instrument of state policy. MacGregor desired especially to maintain the bases of the old native life and urged the strengthening of the chiefs in Polynesia and the old men in Melanesia. When the new system was defined, it was seen to be an indirect rule, analogous in many respects to the new methods which were being introduced into Africa. It aimed at a natural growth through native institutions to that degree of development which the individual tribe was capable of reaching; it represented an invigorating process in which administrators would build on the native past, while removing antisocial tendencies. Each tribe

would meet and overcome its own difficulties and by so doing would undergo physical regeneration; this was the lesson of the Maori of New Zealand. In short it was to be a flexible policy preserving in so far as possible the old cultural vitality, and at the same time continually selecting and adapting itself to new conditions.

The system was applied in different degrees in various parts of the Pacific. Papua continued to follow MacGregor's policy; Samoa, despite certain changes under mandate rule, has retained a system of concentric councils ranging from the village to the nation; and smaller groups like the Gilberts have adopted indirect rule in toto. Elsewhere the British groups have a mixed record. Tonga still apes European constitutions and cabinets, and Fiji has manifested no consistency. While Sir Hercules Robinson, the first ruler, stressed the system of chiefs, later governors reduced it. The result was an undue social leveling and a weakening of the beneficent feudalism of native organization before the individual was prepared for the change. Recently there has been a turn to the lesser rather than to the high chiefs (the *Buli* rather than the *Roko*) and toward self-governing village communes, but the result has not been satisfactory. Small scale peasant proprietorship for the big sugar industry has attracted attention, but is still in its infancy.

The French, although of recent years professing adherence to the theory of indirect rule, have failed to introduce a uniformly constructive policy. They are still inclined in the main to view their Pacific lands as *colonies d'exploitation*, and plans for the preservation of chiefly power—tried by Brunet in New Caledonia in 1914—are exceptions to the general rule. The Tahitian groups are still devitalized and it is only in certain outliers, such as the Leeward Islands, where rigorous conditions have kept the natives at work, that there is any cultural vigor. Since 1925 the guiding motive of the French has been to improve island production by means of large scale Indo-Chinese immigration—a policy which must in the long run tell against the islanders.

In Indo-China the French had tried various policies: in Cochin China rigid assimilation on the Algerian model; in Tonkin destruction of the native mandarins; their maintenance in Annam; and in Cambodia rule through picturesque native kings. But all of these policies failed, and the French began slowly to realize that the

only hope of progress, either for the colony or for the natives, lay along the path opened by various reformers of the type of Paul Bert (*q.v.*) and de Lanessan (*q.v.*), who, in conformity with the general change in the spirit of European colonial policy around the turn of the century, advocated a growth on the sound basis of native institutions—especially in a culture as developed and as traditionalist as the Indo-Chinese—and through native agencies. The sullen resentment of the natives emphasized the necessity for a new policy, and it remained for Paul Doumer to commence a reorganization of the four provinces as a preliminary to a native policy which would offer hope to the millions of Indo-Chinese. In the end this rapprochement between natives and French was to be achieved through the medium of economic prosperity, artificially stimulated by war conditions.

In Java, where somewhat similar conditions prevailed, the Dutch had proceeded by a trial and error policy for centuries and had come to rely on an unusual compromise. The size of the native population led them to retain the native rajahs and to rule by means of Dutch residents, exerting power behind the scenes—a form of direct rule with insufficient personnel, thus intensifying all the ills of this type of control. Coupled with this was the culture system in the economic field, a system of part time slavery elaborated by van den Bosch, by which the natives were compelled to yield to the state a proportion of their produce. In practise this led to countless abuses and to the pouring of wealth into Holland. Attacks by the new liberal parties in parliament and such exposures as that in Multatuli's (Douwes Dekker's) *Max Havelaar* led to the gradual abandonment of the culture system after 1870, although it was retained for the three most important crops and traces of it lingered until 1917.

In both Indo-China and Java the greatest emphasis has been upon peasant proprietorship and village councils, with the native chiefs exerting real power; but the emergence of a minority educated in Europe has combined with this a movement for national councils or parliaments. A class of agitators has secured such national bodies as the Javanese *Volksraad* (1918) and various economic councils in Indo-China; and such agitators—especially when religious fanaticism as well as native ignorance is invoked, as in the *Sarekat* Islam movement in Java—play upon native feelings and tend to divert the natives from the slow but legitimate development

along the lines of village cooperation. Both countries retain mixed systems, with the emphasis on Europeans. In Java the regents are still the crux of the system, although since 1903 native communes have been allowed and a policy of "emancipation of native government" was started in the Preanger provinces in 1918 and has since been extended. In Indo-China the French have diverted the attention of the natives to small scale production of rice. In addition to thus minimizing political grievances they employ more native agents, although the tendency is to educate them in Paris and to use them as agents of direct rule rather than as genuine instruments of indirect rule along indigenous lines. Such a development is probably inevitable in a colony with a population of 21,000,000, with a growing educated intelligentsia; and, after all, the future lies with the village council rather than with the assimilated Annamite administrator.

Japan, as the mandatory for the islands of Micronesia formerly held by Germany, has tried a policy of indiscriminate grafting. It accepts the British theory of indirect rule, the experience of Germany, the American educational policy of the Philippines, and caps the lot with a rigorous assimilation to Japan and an impregnation of the native chiefs with Japanese education and ideas.

Within the Pacific zone are three special regions—Australia, New Zealand and Hawaii. In Australia the separate race of Tasmanians was exterminated by 1876, and the mainland Australians, save for a minority employed on pastoral stations and a few gathered on tiny reserves in the settled states, were confined to the great and sparsely peopled interior, mainly in the north of Western Australia and the Northern Territory. The government has done everything in recent years to provide for the remnants of this race and to mitigate the difficulties of race mixture; in 1932 there were 19,096 half castes and 60,000 full blooded aborigines, for whom the future holds no place other than isolation in the desert interior or gradual absorption. Their economic utility, always negligible even in the pastoral sphere, is bound to diminish.

With the Maori the story is very different. Like all their Polynesian compatriots they declined in the last century, largely because of constant warfare; the Maori population diminished from 114,000 in 1840 to 42,000 in 1891. Their own leaders predicted their ultimate disappearance, but when confronted by racial death they stirred themselves to follow the teaching of a

famous chief of the Ngatiporou, Sir Apirana Ngata, who urged them to split up their old communally held lands and under the new incentive of individualism enter into economic competition with the Europeans. The dreary *hapus* of the far eastern land in New Zealand were soon changed into prosperous sheep farms; and the example spread, for the natives still retain more than 90 acres of land per head, and their country is essentially dairying or sheep land. The government aided this movement by agricultural education and by health campaigns. The old race bitterness gradually disappeared. Maori fought in the World War on equal terms with the whites, and the islands boast a camaraderie rare where races come into contact. The Maori Councils Act conferred limited rights of self-government on the natives and helped to maintain their old tribal organization. In the wider sphere of national politics all were allowed to vote or to run for office; indeed Maori, like Ngata or Sir Maui Pomare, have become ministers of the crown. A Maori is eligible for any political or administrative position, and the absence of discrimination is practical as well as legal. New Zealand thus offers as many avenues of progress as the Maori may aspire to, and the story of Ngata's successful career is that of the regeneration of the Maori race. The Maori increased to around 70,000 by 1932; the future of the race is assured, and as a separate entity, for there are only some 10,000 half castes.

In Hawaii the native problem has taken a unique form by reason of the tremendous migration of various races; there are 320,000 immigrants, of whom 216,000 were Asiatics, making Hawaii "the world's greatest experimental-station in race-mixture." As far as the native Hawaiians are concerned, this influx has meant opportunity for intermarriage—save with the Japanese—a diminishing demand on them for industrial purposes and, conversely, such an intensification of economic development that they had either to play a part or retire to a minor position. On the whole the Hawaiians were more individualistic than most of their fellows, because of the "Great Division" of their lands in 1848, and this together with the progress of industry had the effect of divorcing them from the land. As a remedial measure Prince Jonah Kuhio Kalaniana'ole sponsored a program like Ngata's, and an act of 1920 initiated the Hawaiian rehabilitation movement to turn the natives into homesteaders. They had declined in numbers from 108,000 in 1836 to 39,000 in 1896 (includ-

ing 8000 half castes), and, although some stability has since been obtained and the Hawaiians (full blood and half castes) now number around 50,000, their place is a minor one in a population of almost 370,000, especially in such an industrialized community; and their ultimate future appears to be one of absorption into a composite native-Asiatic-American culture.

As a whole, then, the Pacific divides itself into those regions, such as Melanesia and the less developed groups of Polynesia, where the natives predominate overwhelmingly and those, such as Hawaii, Australia and New Zealand, where large outside populations and extensive development are to be found. In the former, native policy has tended more and more toward the norm of indirect rule and peasant proprietorship, although traces of the old factory fodder idea linger on in the form of Melanesian indentures. In most groups too the problem is undergoing a marked change as a result of the introduction of Asiatic laborers, even in French Melanesia; and the problems of their assimilation and their relationship to general native policy remain in the melting pot. The Pacific is rapidly becoming a series of localized problems, and in view of this increasing local differentiation it is unrealistic to speak of a single general policy. The nearest approach to a norm would be in the partially developed group of Samoa, which stands as an improvement on Fiji and French Oceania and as the practicably realizable goal for the more backward Melanesian lands. Here too is the nearest approach to conditions in the African lands.

Until the closing years of the nineteenth century native policy in Africa, which during its earlier stages had displayed many similarities to that prevailing in other spheres of colonial and imperialistic exploitation, continued to be in the main spasmodic and incoherent, manifesting pronounced variations both as between regions and within a given area. Around the turn of the century a significant revolution was initiated by such colonial administrators as the Englishmen Lugard, Cromer and Johnston, and the Frenchmen Galliéni, Cambon and Lyautey; but despite their several efforts in the direction of a more coordinated and far sighted policy, designed to carry into effect the untried principles of association and indirect rule, not a few of the basic dilemmas have persisted. For no other continent possesses such a congeries of races at different stages of development or has been subject to such varying degrees of European pene-

tration. The policy of the French toward the Hamito-Semitic peoples in the Moslem countries along the Mediterranean fringe shows marked divergences from the Boer and the British treatment of the strikingly homogeneous Bantu races in southern Africa; while the general economic exploitation carried on by the representatives of France, Belgium, Germany, Great Britain, Italy and Portugal against the heterogeneous tribes scattered over the center of the continent and constituting what is generally referred to as black man's Africa involved, especially after "the grab for Africa" in the 1870's, still a third set of problems. Despite these disparities, however, a few broader trends of policy may be detected, particularly in northern and central Africa.

For more than half a century after the occupation of Algiers in 1830 the French colonial administrators concentrated their military strength on breaking the resistance of the virile Arab and Berber tribesmen. Tribal organization and institutions were viewed as barbaric survivals, and in the slow process of driving back the natives to the borders of west and central Africa the methods of *cantonement* and *refoulement* became generally accepted. Committed to a program of progressive annihilation, the military forces aimed at segregation based on continuous withdrawal. Islam was attacked root and branch; native lands and religious *habous* were confiscated; and tribal organization was destroyed. Even an intelligent theorist like Leroy-Beaulieu said that the three bases of native life—the tribe, collective property and the polygamous family—had to be wiped out. This policy was carried out not only in the Algerian Tell but in the occupied parts of the Congo and west Africa, except in four privileged Senegalese communes where the natives were all enfranchised.

The vast extent of territory which had been acquired in northern and central Africa by 1890 made the French pause. The humanitarian and rationalistic temper of eighteenth century France was beginning to emerge once more, reshaping French policy according to older patterns. Invoking again the time honored shibboleth of natural rights, the Colonial Congress of 1889 proclaimed the policy of assimilation as the new order of the day for Africa. Since French civilization constituted beyond cavil the quintessence of life, it devolved upon responsible administrators to convert "the absolute man," whom the philosophers had created to include even the

least gallicized savage of Africa and the Pacific, into a model Parisian. Logic and reason could tolerate no alternative, and despite the opposition of Gustave Le Bon the Congress agreed to ignore such aberrations as racial endowment, ancestral tradition and geographical peculiarities. The colonies were to be French departments; the French local commune was to be introduced; and the natives were to be encouraged to become French citizens. Algeria and the Congo were to have the same organization, however great the differences in native society. The only exception was to be Tunisia, where the peculiar status of the protectorate of 1881 limited French efforts (*see* PROTECTORATE).

The results soon became clear in all of French Africa. In most of the colonies the system could be applied only at the expense of ruthless destruction of native organizations. An attack on one part of a closely interrelated native structure usually meant the collapse of the whole. Uncongenial institutions, such as fee simple and individualization, were introduced in flat defiance of the maxim that a race can evolve only in conformity with its own traditions and mentality. The 1890's witnessed the nadir of French native policy in Africa. The Arabs refused to renounce Mohammedanism: those of the coast obtained a veneer of civilization but the dwellers in the interior watched the destruction of their own tribal institutions and laws with smoldering apathy. In the northern colonies the French encountered all the difficulties involved in attacking a polity wherein state and society were linked with religion; while in the Negro lands of central Africa the development was still more premature and the goal still more unwise.

Around the turn of the century, however, evidences of the breakdown of the older system were becoming increasingly apparent not only in practise but also in theory. Practical experts, like Gallieni in Madagascar and Lyautey on the Algerian marches, protested, in terms reminiscent of de Lanessan and his successors in Indo-China, against the stupidity of assimilation as applied to the natives of Africa. Cambon's success in preserving native institutions in Tunisia (*see* PROTECTORATE) had brought into more striking relief the maladministration and depopulation resulting from assimilation in such areas as Algeria, the Congo, Madagascar and West Africa. ^{ance, but} other hand, the evils of the old policy stirred them. ^{the} rolled exploitation were dramatically the scandals involving the French

Congo, where in the 1890's the natives had been terrorized and enslaved under a company regime ruthlessly engaged in draining the country of its ivory and "red rubber." Attention began to be directed to the experience of the Malagasian Horas, the Tunisians and the mountain Berbers of Algeria, all of whom had been allowed to preserve their native institutions. During this same period colonial theorists were turning in increasing numbers to Taine's environmentalist formulae, Ratzel's geographic determinism, Gobineau's racialism, the positivist ethnological findings of the Broca school and Le Bon's psychological laws of the evolution of peoples. Whereas the Colonial Congress of 1900 had contented itself with adopting a skeptical attitude toward assimilation, the Congress of 1906 openly repudiated the older policy in favor of the new theory of association which, as defined by Jules Horman in his *Domination et colonisation* (Paris 1910), "is the systematic rejection of assimilation, and tends to substitute for the necessarily rigid and oppressive system of direct administration that of indirect rule, with a conservation—albeit a well watched and well directed conservation—of the institutions of the subject people, and with a respect for its past." No theorist or administrator of note stood outside the new theory, and the psychological school of Delafosse joined the administrative materialists, whose views Girault expressed. "Each in his own civilisation!" was the slogan, and after the reform of the Congo in 1907 each African colony saw the strengthening of native councils and other agencies. Along with these changes went an emphasis on the new moral values of colonization and a striking development of native plantations—in other words, economic as well as political association.

The Belgians had practically repeated the French experience, first in the indiscriminate destruction of native life in the Congo, then in the awakening of national conscience by the scandals to which it gave rise and, finally, in the turn toward native cooperation. Unfortunately the destruction of the chiefly system had been too complete, so that by 1917 the Belgian officials stood face to face with a native rabble. This very extremity emphasized the failure and led the colonial minister to announce in 1920: "We claim that the native society should freely develop after its own manner, its own nature, its own *milieu*. We must respect and develop native institutions, and not—as heretofore—break them." Another factor was the new con-

cept of colonization as primarily an industrial process—a concept which involved a prosperous native population as an essential contributory element.

The German experience had been a mixed one. Being comparatively late in the race, they obtained the poorer lands. Moreover they were not at first concerned with human values, so that they carried the French and Belgian theory of exploitation to its extremes. The colonies were factories, handed over to concessionaire companies; and the natives were so ground down that frequent revolts occurred in southwest Africa, in the Cameroons and in east Africa. On the other hand, the scientific and medical services were highly developed, and after 1907 there was more toleration and there was more progress along native lines as a result of the reforms of Dr. Dernburg, who said, "We have not gone to Africa to found three or four hundred plantations." Despite the errors of the company regime Germany was thus evolving toward the same system of native officials and plantations that the British were working out in west Africa, when the former was deprived of its colonies on the alleged ground of colonial unworthiness.

During the earlier periods of trading and the commercial and imperialistic exploitation of central Africa, Great Britain, like France, paid little heed to native welfare; and it was not until the consolidation of the various west African lands that the most powerful of the colonizing nations began to work out a coherent policy toward the natives of black man's Africa. The laboratory of the new experiment was the northern zone of the Niger region, which until 1914 remained separate from the southern colony and protectorate. Until the 1890's two thirds of the natives in the northern zone were under Moslem dynasties, while the remaining third were scattered among two hundred and fifty animistic pagan tribes. In 1900 Northern Nigeria became a protectorate and Sir Frederick Lugard was sent out to formulate a unified policy.

Lugard sensed that a new era had dawned for tropical Africa. The confused "palm oil" stage of unregulated imperialistic exploitation had gone; and the practise of treaty making, which during a long period was the corner stone of British native policy, especially after the assumption of crown control during the partition of Africa in the 1870's, had likewise become indiscriminate and antiquated. The declaration of protectorates led to a realization of national re-

sponsibility; it made Europeans recognize the necessity of putting down slave traffic along the coast and of controlling the strong Moslem kingdoms of the interior. Direct rule being out of the question by reason of the areas involved and the cultural vitality of the Moslemized states, Lugard worked out an indirect form of native control, which was extended after 1914 to the southern section of Nigeria and which eventually became the norm of British native policy in Sierra Leone, the Gold Coast, much of equatorial and southern Africa and spread even across the continent to Uganda.

"To prevent denationalization, to develop along indigenous lines, to inculcate the principle that the function of the ruler is to promote the welfare of his own people and not to exploit them for his own pleasure, and to afford both rulers and people the stimulus of progress and interest in life," Lugard preserved existing institutions, subject to control, and employed native officials. He built up a system of three related parts based on the Native Authority Ordinance of 1916, under which nearly 400 natives exercise delegated power; on the Native Courts Ordinance of 1914, by which the courts are under native judges who administer Moslem or native law with a necessary admixture of British law; and on the Native Revenue Ordinance, which allows eighty native treasuries and continues the earlier systems of taxation. Lugard was always mindful of the condition of the native states of India and counted it a gain whenever natives were allowed a measure of independent action. The ultimate confirmation of the merits of his system is provided by the fact that in the north one British political officer suffices for 100,000 natives and in the south for 70,000.

The result of this manifold experience in Africa was that by the time of the International Colonial Congress of 1921 all the European colonial powers had arrived at a similar basic policy—a policy clearly stated when Sarraut and Franck, the colonial ministers in France and Belgium respectively, met and agreed on common action in 1924. Native policy in Africa, for Negro and Moslem alike, was standardized and directed toward bringing native welfare into harmony with the needs of the new industrial era. The urgent necessity of some form of native adaptation to the modern economic system was emphasized still further in the report of the Ormsby-Gore East African Commission of 1924, which eventually submitted two alternative sets

of recommendations for dealing with the complicated native problem provoked in the British colony of Kenya by the insistence of the 12,000 European inhabitants on carrying through a program of intensive economic development even at the price of overriding the interests of the 2,500,000 natives. Whether in general the natives of Africa can maintain the bases of their society, whether they can produce enough native officials and whether their small scale plantations can survive in the face of world conditions—can be determined only by experience; but the great gain of the last quarter century has been the widespread acceptance of a common aim and the decision to give native institutions, native officers and native plantations a trial. The inapplicable policies and the uncontrolled exploitation of the previous fifty years have been left far behind, as have the coastal draining of wealth and the slave raids.

There were of course certain exceptions to this general trend in native policy. Africa possessed two enclaves, each with a peculiar status: Abyssinia, with a semibarbaric native rule, and Liberia, with a dominant population composed of descendants of freed American slaves. Italy too in its Libyan possessions stood athwart the main path of development and, by enfranchising its African subjects—partly with a view to embarrassing the French in neighboring Tunisia—introduced a confusing element reminiscent of the misdirected liberalism of 1848. Finally, the Portuguese still adhered to the old Spanish system of rigid tutelage for natives, who were treated as minors. In Guinea, Angola and east Africa they maintained time worn notions of direct rule and penalization of natives, combined with undesirable labor conditions and an undue church influence.

Meanwhile the Europeans in southern Africa had been encountering a somewhat similar problem, because here too there were overwhelming numbers of varied native peoples. The Bushmen, the original nomadic inhabitants, were soon driven back to the mountains and the Kalihari desert and became a negligible factor. The Hottentots survived in a few parts of the interior but completely lost their individuality in Cape Town, the south and the east and, mingling with Malays, Kaffirs, Bushmen and whites, became "Cape Boys," speaking the ordinary Cape Dutch language. On the other hand, the various Bantu races—Kaffirs, Zulus, Basutos—were on a distinctly higher plane and were rapidly progressing, numerically and culturally.

The first Europeans to come into permanent contact with the Bantus were the Dutch, who drove them back and enslaved them under an Old Testament type of patriarchal system. When the British freed their slaves in 1833, they were faced not only with the opposition of the Boers in the southern colonies but with the patriarchal native policy pursued by the Boers who had trekked to the Orange River and Transvaal regions and had adopted backward agricultural methods. Involved in frequent complications with the Boers and at the same time beset by a series of native wars, the British in southern Africa failed, at least until the 1890's, to evolve any progressive native policy. The problem could not be viewed as a whole until the Boers were conquered in 1900, and the Union of South Africa was formed in 1910.

The situation which the British faced in southern Africa was particularly complex. In the first place, a less highly developed European population, composed of Boers, outnumbered the British in every province but Natal. There were five natives to every white, unevenly distributed and with sharp differences between those living in towns, mines and farms. Moreover each province had a different policy toward the natives, the divergence being particularly marked as between the older British colonies and the former Boer republics. The existing confusion was still further aggravated by the policy of compromise pursued by the Union government in its handling of the native problem. As time went on, a population of poor whites emerged, numbering as high as 10 per cent of the whole and living side by side with the natives; while another distinct element of half castes called the Cape colored people was made up mostly of European-Hottentot mixtures. Then there were certain outer lands, such as Bechuanaland, Basutoland and Swaziland, set aside for the natives and presenting problems distinct from although influenced by those of the industrialized areas. Finally, the needs of a rapid partial industrialization led to grave interferences with all classes of natives and to the introduction of Portuguese East African natives and 170,000 Indians.

The problems of contact between the various races center mainly around the 900,000 natives who live on "urban locations" in town areas and the hundreds of thousands employed in the mines, particularly in the Transvaal. Both of these groups are divorced from the normal conditions of native life in South Africa—the life

of small cultivators and herdsmen; and both represent the economic thrust outward due to the fact that there is not enough good land to provide sufficient food for all. Both present somewhat similar problems. Those natives who live on the special locations set aside for them in the towns suffer from improper housing, abnormal sex relations, epidemics and illicit liquor traffic, evils which have social repercussions on the other inhabitants of the towns. All of these conditions are present also among the mine boys, with the added complications arising from the system of recruiting and control. Since the recruiting of natives living on European farms is virtually forbidden by law, the mines depend on labor supplies from outside the Union provinces: a third of the Transvaal laborers come from Portuguese East Africa, half from the Transkei and a tenth from Basutoland. The drain is partly on foreign lands, but mainly on those very regions in which special efforts are being made to bring about native regeneration. The laborers are recruited under a contract which compels them to live in compounds and renders them liable to imprisonment for desertion; and experience has shown that no system of this kind can be freed from various abuses.

All of the industrialized natives have to face the "color bar," for the South African system is based on the existence side by side of a few overpaid whites and many underpaid natives. Since 1890 color bar legislation in the Transvaal has forbidden competition between the two sections of the population; and in 1911 a similar act, while not explicitly mentioning the color bar, secured the same result for the Union of South Africa by introducing a system of certificates to be held by all laborers using machinery. The owners wanted cheap labor and asked for a removal of the prohibition on recruiting natives north of 22°; the unions upheld the color bar and wanted a ratio "progressively favorable to the white race" in every industry except agriculture. In Parliament the Labour party fought for the color bar; the Nationalists, largely agricultural, advocated it on broader cultural grounds; while the manufacturers advanced it as an argument for high wages and high tariffs. In addition to actual legal discrimination, such as the Wage Act of 1925, a conventional color bar exists in most industries in Cape Province and Natal, and the Jim Crow principle is widely, if tacitly, assumed. In all four provinces natives have to submit to the pass system, are denied military training and cannot acquire crownland or use

the Land Bank. There is a distinct racial feeling directed against the town natives by the great bulk of Europeans, who are convinced that they should remain in a state of inferiority and are inclined to use any degree of political or economic pressure to secure this result.

The same bitterness does not operate so keenly against the country natives. The problem here is one of numbers, for 5,000,000 natives are scattered through the country districts, 3,250,000 on native reserves and over 1,500,000 on European farms. All native lands were originally expropriated; but the Cape led the way in making reserves, for the most part, except in the Transkei, in small locations. Similar crown locations and mission reserves were made in Natal and most of Zululand was set aside as a trust. The Transvaal was not as liberal, and the Orange Free State took practically no steps in this direction. The present position is indicated in the following table.

	PERCENT- AGE OF TOTAL LAND AS NATIVE RESERVES OR LOCA- TIONS	NATIVES LIVING ON	
		RESERVES	EUROPEAN FARMS
Cape of Good Hope	8.47	1,250,000	248,000
Natal	22.83	648,000	443,000
Transvaal	3.22	417,000	640,000
Orange Free State	0.48	24,000	28,000
Union as a whole*	7.12	3,291,000	1,611,000

* Includes special native lands in addition to the four provinces.

In addition natives have acquired 0.6 percent of the Union outside the reserves and for many years have been agitating for extended purchasing rights. Half of the rural natives live on holdings of their own, either within or outside the reserves and, although the communal nature of Kaffir pastoralism has led to a prevailing poverty, many are sufficiently prosperous to feel a land urge. Eighty-four percent of the Union is reserved for 1,500,000 whites, while 5,000,000 natives hold 8 percent and can under certain conditions purchase an additional 6 percent.

In recent years, however, the political question has attracted much more attention than the economic. The present policy is an anomalous one, based on historical accidents and laissez faire, and reveals no uniformity from province to province. The Cape allows unqualified and unrestricted civil and legal equality; Natal makes certain theoretical concessions; while the other provinces confer practically no rights of this

kind on natives. The Union itself represents a compromise, for when it was formed the northern provinces would not consent to the extension of rights to the natives, while the southern provinces would not consent to their penalization.

The resentment of the native population, directed at first against economic inequality, has been extended since the Boer War to the political sphere. Commissions have revealed the dissatisfaction of the Bantu at the dislocation of their customs, without compensatory privileges as enjoyed by the new race of intruders. The Zulu rising of 1906 confirmed the existence of the discontent, and the Native Affairs Commission of 1906-07 showed its urgency. The World War distracted attention from this problem, but it has since become ever more pressing. A new racial consciousness is aided by the fact that a fourth of the native children now go to school; and, although tribal and personal rivalries stand in the way, the feeling of frustration acts as a constant incentive to united action. Resenting the piecemeal or repressive policies applied to them, the natives recall skeptically Rhodes' formula of "equal rights for all civilised men south of the Zambezi."

These complexities have called forth a variety of apparently unrealistic solutions, ranging from complete isolation of the natives, to fusion of Bantu and white, to assimilation through education. In recent years, however, attention has been concentrated chiefly on the theory of differentiation, or zoning, which means that natives may work for Europeans but have separate provinces as their homes. This theory, as formulated in the Glen Grey Act of 1894, was first applied in the Transkei, a Cape region of 16,000 square miles and comprising 1,000,000 natives, where self-governing communities were set up in native reserves. According to the provisions of the act the natives were to be segregated on special areas; small freehold allotments within the reserves were to give them individual property and provide incentives impossible under the prevailing system of communalism; a labor tax—never really applied—was to induce them to work; and control was to be exercised through boards and councils of natives (*Bhungas*) with European advisers. The plan succeeded from the outset. A General Council was established in 1895 and smaller administrative and taxing councils were set up; these now exist in each of the Transkei territories and are being extended to the more primitive races in the Ciskei. The

Native Affairs Act of 1920 accepts this system as the basis for all future development and aims to extend it to all parts of the Union, for it is sufficiently adaptable to suit tribes at every stage of contact with Europeans.

Similar questions were at once raised with regard to the other outer lands, in which European penetration had not progressed to any great degree. Thus the highlands of Basutoland have been a model of racial preservation since the assumption of crown authority in 1884, and the methods there followed have gradually spread outward toward central Africa. There are only 1600 Europeans to 500,000 natives, and extension of settlement is practically prohibited. The Basutos, a fine Bantu race which stood out in the early days against both Zulus and whites, have kept their native self-government, their own laws and their old institutions. The land has been left to the chiefs and the occupants pay tribute. Native customs, such as polygamy, are maintained even if opposed to European ideas, provided that they are not antisocial. The Basutos, thus guarded in their cultural heritage, have become efficient cattle and grain producers, and their experiment has been a most successful one. Similar conditions obtain in Swaziland, a tiny enclave of 110,000 natives in the southeast of the Transvaal, although the natives there keep only a third of their land. These examples have influenced the much larger Bechuanaland protectorate, where the comparatively sparse population of 150,000 comes into contact with only 1700 Europeans and is ruled by the native chiefs under the supervision of eleven resident magistrates.

Farther north, in Rhodesia, the problem is modified in view of the presence of 60,000 Europeans permanently resident among 2,125,000 virile natives. In the southern section of Rhodesia, although the natives have no vestige of the political rights vouchsafed in the Cape, they are in a better material position than any of the Union natives because they have an easier pass system, they have six times as much land in proportion to population in their reserves, more of them actually live on the reserves, they can settle more easily on outside lands and they can buy land. The entire question of their lands was referred to the Judicial Committee of the Privy Council in 1918, and in a famous judgment which is the basis of British policy in east Africa today it was decided that the land belonged to the crown if the natives had no highly developed ideas of ownership. In the sparsely

settled northern section of Rhodesia problems of mining industrialization and extensive white settlement are practically non-existent as compared with the southern provinces. The zone system of Basutoland has been extended, until within recent years it has led to an agitation for a racial repatriation north of the Zambezi. Adherents insist that a zoning of this kind, combined with a policy of preserving native culture and institutions, would prevent questions of racial friction, social contacts and political grievances.

It is difficult to foresee any unitary solution of the native problem in these vast lands between the Cape and Tanganyika. As against the single factor of racial homogeneity historical development, economic conditions and methods of control are so varied as to preclude any uniform solution. Neither a standardized native policy nor a coordinated movement of segregation is feasible for such a variety of social and economic conditions as prevail in the different regions of southern Africa. At the same time the natives, in their new racial consciousness, have found difficulty in comprehending the fortuitous and arbitrary divergences of policy and status as between adjacent territories. The general atmosphere of racial malaise which colors the South African native problem is, however, more intense in the case of the natives who have worked for Europeans and who themselves despise their kraal compatriots than in that of the pastoral natives on the reserves. Accordingly it is in the Free State and in the Transvaal that the question of cultural disintegration resulting from European contact is most immediate. The culture of the native villages in the outer Bantu lands has maintained itself to such an extent that new plans of racial concentration are possible. But, in contrast to the apparently effective policy evolved in northern and central Africa, it remains a matter of extreme uncertainty whether expatriation or assimilation to European-Boer standards or the emergence of a composite culture is the way out. All that can be said is that the alternative is a constant campaign of attrition directed against the native organization.

STEPHEN H. ROBERTS

GENERAL SUMMARY. Certain general conclusions emerge from the various regional studies of contact between native and European races. In practically every case the coming of the Europeans was accompanied by disintegration, a process which extended to hinterlands even

where direct European contact was restricted to coastal regions. The reason was that new ideas inevitably led to changes in a polity which was built on a basis of immobile custom and the parts of which were so interconnected that a challenge to any one involved a weakening of the whole. This explains the failure of the various policies until the latter part of the nineteenth century, since all meant change and most were uncoordinated stressings of one aspect alone. All were based on a confused ideology, and thus all—even those inspired by the loftiest motives—adversely affected native well being.

The accepted policy of the early stages of contact was *refoulement* in its various forms, a driving back of the natives either to make room for Europeans or to provide in some way for European needs. After the first disorganized contacts natives were usually employed as economic fodder in an industrial transformation. This took the form either of the slave trade and indenture systems or of an exploitation of the natives in their own lands. As the growth of a more sensitive conscience led to the elimination of the former aspects during the course of the nineteenth century, the industrial revolution intensified the latter and, after about 1870 in particular, the natives had to play their part in providing markets for the cheap products of European factories and in working to supply the necessary raw materials, especially when industry became increasingly dependent on those originating in the tropics, such as the oleaginous products.

From the outset there was also in operation a different set of forces, dating back to the first contact of Spaniards with America: ecclesiastical and philanthropic paternalism. This later took the form of opposition to the slave traffic, although, particularly in the Portuguese and Spanish colonies, it could be accompanied by assigning inferior, or minor, status to the natives once their souls were saved. Concurrent with this trend was democratic egalitarianism, arising from abstract generalizations about democracy and especially from the French theory of assimilation, which constituted a curious blend of the eighteenth century exoticism of Chateaubriand and the doctrines of Rousseau as exemplified in the French concessions of universal enfranchisement. An offshoot of the same principle was the formation in the Pacific of various missionary kingdoms, on the approved models of the latest European liberalism. Closely connected with the same theories in its origin, but

bringing about diametrically opposite results, was the policy of *laissez faire*, so popular in England with nineteenth century theorists. In the colonial field this took the form of ascribing full rights to native peoples and leaving them to work out their own destinies, in defiance of the fact that the way was thus opened for exploitation by adventurers and more materialistic nations.

Finally, every nation adopted policies of direct rule in various guises; and here entered the influence of extreme nationalism, Darwinism and of course Nordicism. A combination of these, especially the realization that the weakest must go to the wall, led to the great period of imperialism in the later nineteenth century, as seen in the grab for Africa, the opening of Asia, the industrialization of South America and the partition of the Pacific, with the rights of the natives ignored in each case.

Gradually the failure of all of these policies led to new ideals and new methods. Many factors contributed to the change, quite apart from the earlier failures. Research in various fields, especially in anthropology and psychology, necessitated new ideas of native society and caused a reaction from Bastian's theory of *Elementargedanken*, or the essential similarity of all native structures. Instead of uniformity, differences came to be emphasized; and there were also a realization of the potentialities of various native races and the belief that each might survive, without reaching either the impossible goal of assimilation to the European standard or the lowest level of primitive savagery.

In the years after 1870 too there set in a reaction against *laissez faire*, alike in its European and in its colonial implications. "The white man's burden" was spoken of, and native matters were viewed with a sane humanitarianism. The superficial simplicity of the ideas of the early nineteenth century was now scorned as unscientific, and rigidity of the earlier type was sacrificed to the newer considerations of how the natives in any particular group could be made to increase in numbers and to prosper under their own conditions. At the same time there was a recognition of international responsibility, as in the attempt to settle the Congo by an international venture and to rouse opinion because of atrocities in the French and Belgian Congo and on the Putumayo in South America. The more recent propaganda against Germany's colonial unworthiness, although admitted by historians to be grossly exaggerated, and the

system of mandates (*q.v.*) have added to this trend.

Finally, new economic conditions have exerted a preponderating influence. The early stage, in which colonial possessions were indiscriminately stripped of easily accessible wealth, was over; and, if only for the crudest economic motives, colonizing powers were forced to see that the natives, as essential instruments of production in the industrial world, should prosper. This was the later period of finance capitalism and did much to remove the evils of the earlier company period in Africa and in the Pacific. Later still, but partly in pursuance of the same motive, there was a tendency to further native possibilities, such as peasant proprietorship, cooperation in small plantations and the growing capitalization of the native unit, often in competition with the European.

Thus occurred a reaction from mistaken, selfish, uncoordinated, inapplicable policies to norms that, curiously enough, involved a basic uniformity reminiscent of Bastian's presupposition. The fact of the protracted failures of the older methods, buttressed by ethical and economic arguments alike, led gradually to a great degree of standardization in native policy, except in those regions where the native unit is obviously bound to disappear or be submerged beneath a large and dominant European population. It is therefore now possible to formulate a standard native policy, capable of adaptation to any particular set of local circumstances and applicable to all regions where natives are destined to remain in the majority.

Scientific research made it clear that the only line of progress was in keeping and reviving native institutions. Racial pride and cultural traditions were to provide the nucleus; and the result is that—aided by the new international morality—"the native problem," that bugbear of nineteenth century imperialism, has been largely resolved. The new policy is a blend of various degrees of indirect rule, the extent varying with each tribe; of vocational education; of cultural conservation to prevent depopulation; and of peasant proprietorship to allow indefinite economic expansion and adaptation to the new economic age. Indeed the latter, the native industrial revolution, sums up the others. Together they form one well knit whole, lending itself to infinite variation. The application of this norm depends on each administrator, although experience in every part of the world demonstrates the practicability of the new the-

ory. The realization of the norm in itself constitutes the great advance over last century, for the accumulated rubble of thwarted effort and misdirected aims has been cleared away, and the administrators of all the colonizing powers are face to face with essentials, both of aim and of method.

As applied in practise this means the virtually complete adaptation of Polynesia and the beginning of such a development in Melanesia; a compromise in Java, Indo-China and most South American lands; and in Africa the great transformation of the west during the present century, the increase of the Bantus in the south and the limitation of the problem in the north to its cultural and religious aspects. Serious evils remain, such as the depopulation of the Congo and the native problem of Kenya; peculiar cases like Hawaii and the Transvaal must increase with the progress of industrialization; and certain races like the Australians and many of the North American Indians must have little future beyond the easing of their last days. But except for these the outlook is totally different from that of sixty years ago, when native policy was lost in a bewildering maze of contradictions and national rivalries.

NATORP, PAUL (1854-1924), German philosopher. A great grandson of Ludwig Natorp, theologian and organizer of the Prussian *Volkschule* in the spirit of Pestalozzi, Paul Natorp likewise directed his efforts toward fusing society and education in an ideal unity. Schooled in the 1860's and 1870's, when exact science and its methods became ascendant in the intellectual sphere, Natorp felt obliged to renounce a theological and metaphysical world view but retained a primary interest in man's self-cultivation (*Bildung*) as a whole. He espoused neo-Kantianism, developing a "critical idealism" in close relation to that of Hermann Cohen, especially after joining Cohen as professor of philosophy at Marburg in 1885. Exact science was for him the product of mathematical and logical thinking, which presides over the uniform ordering of experience. At the root of such thinking is the idea (*Idee*) of a completely unified manifold, which we never reach but which indicates the ultimate ideal of practice and the norm of obligation. As the individual "scientific object" arises only in a logical ordering of nature, so

too the moral individual must be produced in an ideal ordering of society. On this basis Natorp and the Marburg neo-Kantians were able to develop a social, democratic ethics of considerable influence.

While Natorp's practical philosophy did not overlook the economic and political aspects of social organization, its distinctive note was the paramount emphasis on the educational aspect. The highest significance of the social order lies in its educating effect upon its members, and a worthy social order can be achieved only by educational means. In elaborating these views Natorp was greatly influenced by the study of Plato as well as of Pestalozzi and German idealism. His *Sozialpädagogik* gave a moral and philosophic perspective for the reconstruction of general education, replacing individualistic and intellectualistic conceptions by the ideal of a social harmony of all powers. In his person as well as in his thought he proved an inspiration to German educators and to German youth. An overwhelming sense of the conflicts within both the nation and mankind at large came to him through the World War. He supported the *Einheitschule* idea to promote a common national culture irrespective of class or creed and took part in drafting a common school program in 1920 under the Weimar constitution. Under his program Germany was to set an example not merely in economic but also in cultural socialization and in social idealism. At the same time Natorp built great hopes for international reconciliation and for this reason he joined the Quakers.

NATURAL LAW as conceived by its exponents is that law which, grounded in the innermost nature of man or of society, is independent of convention, legislation or other institutional devices. The problems which it raises are as old as the earliest speculation regarding law; for it is a reflection of the antinomies inherent in the realm of jurisprudence itself, wherein ideal norm is confronted with the deviations of reality, apriorism with empiricism, autonomy with heteronomy, stability of the established order with the dynamic of moral progress, justice with security, ideal with social necessity and immobile organization with the elastic continuity of life. Under each of these manifold aspects the term natural law may assume a special connotation. It may be used to designate the ethical justification of law as a whole; as the a priori element antecedent to all law; as the ideal source of law and the criterion for testing the positive law emanating from this ideal; as the invariant rules of law in contrast with the changing; as autonomous law deriving its validity from its own inherent values; as spontaneous law differentiated by its living and organic properties from the law promulgated in advance by the state or its agents.

Inasmuch as the exponents of natural law have not as a rule been overparticular in drawing these finer distinctions, the meaning of the term has been somewhat obscured. In particular the terms nature and natural have proved to be confusingly protean. As used in the natural sciences nature is synonymous with the physical universe; or again it may be the normal as contrasted with the pathologic; or the ideal essence of an object; or the spontaneous and unconscious flow of life as opposed to that which is artificial, deliberative or willed. In the same way natural is set off against the supernatural and the revealed; or it may be used in the sense of "natural reason" or evidence; or as the innate in contrast with the acquired; or as the antithesis of civil or, again, of authoritarian. It is not surprising therefore that the various schools of natural law have interpreted the concept with considerable variety of emphasis. Whereas the stoics and certain Roman jurists interpreted natural law as that law which conformed to the natural order of the universe, and which, according to certain exponents of this school, extended its sway even to the lower animals, and whereas Hobbes and to an even greater degree Spinoza conceived natural law as synonymous with the force of nature (*naturae potentia*), Plato and Kant deduced it from the moral ideal. Locke identified it with the har-

mony prevailing in a remote primitive state of uncorrupted nature, while Aristotle, Leibniz and Wolff regarded it as intimately bound up with the essence of existing society. Rousseau drew a careful distinction between "instinctive natural law" and "reasoned natural law"; and Fichte considered it as a law of reason (*Vernunftrecht*), an a priori logical category informing all law.

Yet despite the diversity of these and many other versions of natural law a common element may be detected: a dualistic tendency to resolve the antinomies constantly reappearing in the sphere of jurisprudence by disentangling and isolating the conflicting elements. Thus law as a natural phenomenon is disentangled from artificial law; ideal law from real law; immutable law from changing law; a priori law from empiric law. For this reason one of the most crucial problems in jurisprudence has been that of establishing criteria whereby a solution may be provided for those conflicts which seem inevitably to arise between positive and natural law.

A familiar type of solution proceeds by assuming the primacy of natural law, which in case of conflict is held to overrule positive law. This essentially revolutionary version of natural law may be observed, with a variety of nuances and shades of emphasis, not only in Locke and Rousseau but among the theologians of the Middle Ages and, after the Reformation, among the monarchomachs. Where the primacy of natural law is based on a law inhering in the individual, the hypothesis leads logically in the direction of anarchy. On the other hand, if this primacy is based on a law inhering in a particular social group, the logical result is the overriding of the positive law of one group, as, for example, the state, by the positive law of a second group, as, for example, the church or the feudal associations. Thus the insistence of certain of the mediaeval theologians that the definition and interpretation of natural law were the exclusive privilege of the church was basically an attempt to establish the supremacy of the positive law of the first estate.

A second formula for resolving the conflict between natural and positive law consists in taking for granted the primacy of the latter. The classical statement of this position, as formulated by Grotius and his followers Wolff and Nettelbladt, maintains that positive law may not only prohibit that which is allowed by natural law but also approve that which it forbids. The thesis of Grotius, which has likewise found an echo

among certain recent exponents of natural law, that the only legitimate function of the latter category of law is to supplement the positive prescriptions of the lawmakers on questions not already specifically covered, tends to equate natural law with the intuition of the judge, the administrator or the learned jurist. Not infrequently theorists of natural law have skirted the problem of conflict, either by assuming that positive law is merely the embodiment of natural law or by ignoring the dilemma altogether, despite the fact that it is obvious that in so far as natural law is regarded as a functioning law, directly binding on its subjects, the problem of the conflict of the two categories must remain a most crucial one. ✕

Although natural law has been repeatedly invoked by conservative apologists in order to rationalize existing institutions, it has more frequently served the purposes of the revolutionary reformer who seeks to introduce a radical improvement in the existing body of law. Any breakdown of categories, any restlessness of juridical thought, are invariably reflected in enhanced interest in natural law. Each time the jurist seeks new categories as an aid to setting up new institutions free from traditional encumbrances he begins by opposing natural law to positive law. Thus Grotius, the founder of the modern doctrine of international law, in his preoccupation with the problem of subjecting the newly forged nation states to a supernational juristic authority, posited a natural social law binding together the international community. The periods of greatest concern with questions of natural law have coincided with critical epochs in which the established order has been beset by new currents of thought and new social aspirations. During the great eras of reform and revolution, especially during the seventeenth and eighteenth centuries in England and in France, the various schools of juristic thought turned with particular fervor to the task of reinterpreting natural law. Then, as in all particularly trying moments in the life of a society, the aid of natural law was eagerly invoked. "It will be observed," writes a French historian, "in following in the *Moniteur* the debates of the Constituent Assembly, that the appeals to natural law became more frequent as the political skies darkened." Just as the formulae of the classic "école du droit naturel" voiced the revolutionary aspirations of the third estate, the "renaissance of natural law" at the end of the nineteenth century and the beginning of the twentieth expressed the aspira-

tions of the fourth. And whereas the natural law formulae of the bourgeois ideologists emphasized the individualistic aspects of natural law, the later proletarian ideologists have thrown their emphasis on its social and group implications. The revival of natural law has also been advocated by certain modern jurists as a reaction against the traditional tendency to place major emphasis on the multiplicity of the sources of positive law.

One of the characteristic features of natural law has been its striving after unity and universality, as opposed to the particularism of the systems of positive law. With few exceptions the partisans of natural law have thrown their emphasis on the cosmopolitan element inherent in all law, stressing the common meeting point of the various systems of national law. In so far as this emphasis has been instrumental in preparing the way for a type of positive international law, recognized as superior to the various national systems, its validity should be recognized. On the other hand, this validity has been seriously weakened by the accompanying tendency to overabstraction and rationalism and by the fact that this interpretation has tended to ignore the concrete complexities of the social dynamic.

Theories of natural law may be traced back as far as the period of the sophist enlightenment in Greece of the fifth century B.C. Proceeding from their basic premise that man is the measure of all things, the sophists challenged the prevailing faith in the divine origin of law and set out to show that established law is the artificial creation of human will and human conventions. To this artificial and conventional order they opposed natural law, a law rooted in the very nature of man. According to Protagoras, one of the earliest of the sophists, man is by nature evil and ill disposed toward his fellow men; and natural law has no relation to peace and order until individuals come together and agree to found the state, whose will thereafter becomes the measure of all things. Protagoras' interpretation of natural law, strikingly prophetic of Hobbes, is essentially a justification, addressed to the individual conscience, of the established order. In opposition to the conservative theses of Protagoras the sophists of the following generation, Hippias, Lycophron and Alcidas, formulated a system of natural law radical and subversive in its implications. Maintaining that "all men are equal cocitizens by nature, but not according to positive law . . . which acting as a tyrant over men forces them to actions contrary to nature," they

appealed to natural law as a standard for revealing the shortcomings of the positive laws to which men submitted. Lycophron, according to the testimony of Aristotle, denied the legitimacy of all hereditary privileges, repudiating them as incompatible with the natural equality of man which the positive law should serve to carry out and to guarantee. Alcides, who shared the convictions of Lycophron, carried these premises to even more unprecedented lengths, inveighing against slavery as an institution contrary to the dictates of natural law. The succeeding generation of sophists, as typified by Calicles and Thrasymachus, interpreted natural law, along lines suggestive of Haller, as the innate right of the strong to dominate the weak. This natural law of the stronger was set off by Calicles against positive law, which he regarded as a creation of the weak with no binding power on the superman; to Thrasymachus, on the contrary, the established order represented merely a manifestation of the power of the strong, justified by reason of their natural right to dominate the weak.

The theory of natural law in Plato represented a double reaction against the conception of the sophists. It gave to natural law a metaphysical foundation by considering justice, the highest criterion of natural law, as an eternal idea. At the same time Plato interpreted natural law, in a universalist manner, as an organic harmony wherein each individual and each class are called upon to carry out an appointed function. Accordingly natural law finds its realization in a state founded upon a hierarchy of classes; it is the juridical order of this state, an order essentially authoritarian and anti-equalitarian. Although this theory of natural law implies an identification of law with the moral ideal, it should be noted that Plato conceived natural law not only as the *a priori* antecedent of all law but also as an ideal criterion for correcting existing law. Aristotle's conception of natural law was directed against both the theory of the sophists and that of Plato. Functioning society, which he identifies with the state (*polis*), is a necessity of nature both from a physico-psychic and from a rational and ethical point of view. There can be no question of a law prior to or superior to the immediate realities of a society in operation. Natural law thus becomes identified with the established order of the existing society; or rather it constitutes one element in the positive law, inasmuch as Aristotle draws a distinction in the body of positive law between that which is in-

dispensable as a result of the very nature of the state in question and that which is contingent and based solely on legislation.

With the stoics natural law became fused with the general law of the universe and once more took on a predominantly individualistic tinge. The subjects of natural law were considered as abstract representatives of the same species, bound together only by their common submission to the same universal law. Thus arose the recurringly invoked cosmopolitan formula of the stoics which in considering every man as a citizen of the world sought to destroy all barriers between nations. Moreover this universal law, conforming to the law of nature and identical with physical laws, was conceived as applying to all creatures, plants, animals and men and thereby as establishing unity and order among them. This law, which rightly interpreted constituted nothing more or less than right reason diffused throughout the universe, was indistinguishable from Jupiter, the cosmic ruler. The natural law of the stoics was advanced less as a substitute for positive law than as a basic foundation, or *logos*, thereof. The Roman jurists in their efforts to bring greater precision into the stoic theory of natural law introduced a variety of increasingly subtle distinctions. Whereas Ulpian extended the sway of natural law to "all animals which live on sea or land, and to birds as well," his successors carefully differentiated the natural law peculiar to the human race and the human reason from the natural law common to all animals, including man. In order to distinguish more satisfactorily between these two types of natural law Roman jurists introduced the term *jus gentium* to designate the natural law peculiar to the rational nature of man. It should be noted, however, that the *jus gentium*, embracing the human race as a whole in contrast to the *jus civile* limited to Roman citizens, constituted not only natural law but also, in so far as it was founded upon convention and usage, positive law. Thus in Roman theory a distinction developed between the natural law common to all rational beings—*jus gentium* with natural implications—and the *jus gentium* of a positive character.

The rise of Christianity and the development of Catholic doctrine brought about a profound change in the older conceptions of natural law. While profiting from the doctrines of the stoics and the Roman jurists, the church fathers, particularly St. Augustine, divorced natural law from its intimate connection with the physical universe and grafted it on to the *corpus mysticum*

and on to the spiritual unity, founded upon grace and encompassing earth and sky. A further distinction was drawn, in deference to the theistic emphasis on revelation, between natural law, the ultimate rational principle ruling the divine cosmos, and natural law, considered as an expression of the will of God and revealed to man by the Holy Scriptures. The distinction between natural law as an expression of divine reason and natural law as an expression of divine will was developed still further in St. Isidore and led at a much later date to a protracted controversy between the schools of Thomas Aquinas and the nominalists, headed by Duns Scotus and Ockham. Aquinas, in subordinating entirely the will of God to His immutable reason and to the *lex aeterna* flowing therefrom, made revealed natural law synonymous with the natural law binding God Himself. At the same time he introduced a new distinction between the *lumen naturale* belonging to man and the *lumen divinum* and consequently between the human natural law which can be discovered by the unaided human reason and the divine natural law attainable only by grace and jealously guarded by the church. There may be detected in Aquinas the first effort in Christian philosophy to effect, at least partially, a secularization of natural law. This effort became more pronounced and systematic in the work of Aquinas' successors, Biel, Alamin and particularly Vasquez. Taking as their starting point the inability of the divine will to modify the rational natural law, or *lex aeterna*, and the idea of the *lumen naturale* residing in each human being, they reached the revolutionary conclusion that natural law would exist, God or no God—a thesis which in the seventeenth century was widely popularized and applied in a more sustained and vigorous manner by Hugo Grotius. It should not be forgotten, however, that the school of Aquinas made a crucial reservation in insisting that inasmuch as the *lex aeterna* was superior to the human natural law, the church as guardian of the *lex aeterna* was entitled to exercise full domination over the state as well as over individuals.

The nominalists, on the other hand, particularly after Ockham, by making natural law synonymous with the personal will of God, were in a position to undermine the pretensions of the pope and of the church in general to exclusive interpretation of natural law. This anticlerical and anti-institutional tendency is evidenced most clearly and with greatest precision in the work of an early fourteenth century theologian, who in

other respects took little part in the quarrel between the nominalists and the realists—Marsilius of Padua. In maintaining that the only qualified guardians of natural law, whether human or divine, were on the one hand the community of the people in a state and on the other the community of believers in the church, he became the first systematic representative of the democratic idea of the inalienability of the sovereignty of the people.

After the Reformation not a few of the ideas of Marsilius were taken over by the Protestant and Catholic monarchomachs. Although in proclaiming the inalienable rights of the people they often confused positive customary law and natural law, they drew particular attention to the natural law which authorized the people to revolt against and even to assassinate the tyrant. Proceeding from theistic premises, however, they reviled the tyrant as an offender not only against natural law but also against the will of God, which had sanctified the *pactum subjectionis*, whereby the people had agreed to subordinate themselves conditionally to the prince. The recrudescence of theistic premises in the post-Reformation period may be observed likewise in the doctrines of natural law which grew up in connection with the political and religious conflicts in England in the seventeenth century before and during the first revolution. In the theories of the Independents, the true founders of modern liberalism, in the libertarian homiletics of Robert Browne and Roger Williams and in the polemical broadsides of Lilburne and the Levellers, sanction for the innate and inalienable rights of man to liberty and immunity from interference by tyrannical rulers was repeatedly sought in a natural law saturated in the Protestant faith that the kingdom of God lies within the individual. The natural right to religious toleration, based on the liberty of interpreting the Holy Scriptures and of finding the personal path to salvation, was revered as the foundation consecrated by religion of all innate rights and thus of all liberty. 4

A consistently secular version of natural law emerged only with the rationalistic juridical doctrines of the classic school of natural law in the seventeenth and eighteenth centuries. After Grotius, whose greatest reputation was gained in other fields, had proclaimed, in reenforcing the theses of Vasquez and of Biel, that God is incapable of modifying natural law and that this law would continue even if God ceased to exist, the work of secularization was carried on in more pronounced fashion by the mechanistic school of

Hobbes, Pufendorf and Spinoza. In the mechanistic system the term natural was invoked as an antithesis to that which is supernatural and heralded the application to the study of law and of society of the new methods of the natural sciences, particularly mechanics. Just as the physicist breaks up into atoms the body which he is studying, so the jurist should break up the civil state into its irreducible elements, which in this case are the component individuals considered as placed in a hypothetical state of nature. So conceived the mechanical movement of the physical atoms is paralleled by the instinctive effort of similarly minded individuals toward self-protection and self-preservation, an instinctive effort identical with natural law itself, which in the state of nature implies a *jus ad omnia*. Since the collision of atom-individuals thus produced is in contradiction to their inherent tendency toward self-preservation, the *lex naturalis* demands of them that they come together and agree to concentrate their *jus ad omnia* in the state—which acts in the capacity of a global mechanical force holding in place the divergent particular forces and thus as a guarantor of order and peace. The positive law of the state must be thought of therefore as realizing the law of nature, which serves not as an implement for criticizing the existing order but rather as a justification of the status quo and as an instrument for combating subversive theories directed against the authority of the state. This justification of the state, however, was addressed to the reason of the individual member, and in contrast to the collectivist emphasis of the mediaeval *pactum subjectionis* the new *pactum conjunctionis* of the mechanistic school called upon the individual to create the civil state from the chaos of the natural state by an exercise of his will. In the case of Spinoza, whose mechanistic and geometric methodology tends to disguise a deep lying mysticism, there may be detected a marked inclination to utilize the new system of natural law as a bulwark of liberal and democratic ideas. Since, argued Spinoza, the power of the state cannot penetrate the inner spiritual recesses of the rational being, the natural law demands that it should recoil before the invincible force resident in the reason of the individual, which constitutes a reflection of the infinite reason of God.

But above all Locke and Rousseau, in abandoning the mechanistic methodology of their predecessors and yet at the same time preserving and developing more profoundly their rationalistic individualism and their contractualism,

made use of the theory of natural law to develop the systems which served as justifications for the second English revolution and prepared the way for the cataclysmic doctrines of 1789 (see NATURAL RIGHTS). Seeking to integrate the heavily theistic political theories of the Independents with the more rationalistic theories of natural law, Locke generalized the theory of the innate rights of the individual to liberty and appealed to the theories of the monarchomachs as substantiating the inalienable sovereignty of the people and their right of revolt whenever the public authority, even though it be the legislative, infringes upon the inviolable natural rights of man. Rousseau based his theory of natural law on the presupposition of the moral dignity of the individual, which being inalienable necessarily implies liberty. He distinguished between instinctive natural law, which leads to liberty so long as man remains in a state of innocence but which makes possible the greatest evils as soon as he is forced to emerge from this state, and the reasoned natural law, which alone in the modern context can guarantee that the moral dignity of man shall be preserved in its social setting. Reasoned natural law is grounded in the *volonté générale*, which is interpreted by Rousseau, in terms not unlike those used by Kant in analyzing the practical reason, as the innermost sense of law with which each individual is imbued and which is essentially the same in all members of the social collectivity. In order to safeguard this reasoned natural law the like minded individuals comprising society were constrained to renounce by means of a social contract their instinctive natural law and to submit themselves to the *volonté générale*, or, in other words, to that sense of law which resides at once in the reasoning individual and in the collective society. The public authority thus constituted retains its legitimacy only in so far as it acts in conformity with the dictates of the deeper will of each individual; that is to say, in conformity with the reasoned natural law. This law implies a synthesis of liberty and of equality, each individual enjoying, by reason of his underlying sense of law, equality with all other individuals and, in giving affirmation to this sense, liberty. The inalienable character of popular sovereignty becomes but a consequence of this theory of reasoned natural law, and universal suffrage merely its realization in the realm of practical affairs. When the individual becomes aware that the enactments and decrees of existing political agencies contravene his inner sense of law or, in other words, do

violence to his enjoyment of liberty and equality, he is released from the obligation to obey. Thus all legitimate positive law becomes permeated with reasoned natural law; in so far as it does not, its binding force is annulled. This basic hypothesis of Rousseau, by transcending the dualism between natural law and positive law and by proclaiming throughout the primacy of the former, gave to his body of theory a dynamic revolutionary character.

Kant like Rousseau sought to transcend the dualism between natural and positive law, but in so doing he gave to the former an unfamiliar interpretation, advancing the concept *Vernunftrecht*, or law of reason, a natural law constituting the a priori form, or *logos*, of all law. The critical method of Kant, if applied in a strictly logical manner to the domain of law, precluded the possibility of deducing from an a priori idea or from an ideal an empiric law which could be considered as an alternative to existing prescriptions of positive law. Kant was therefore compelled to consider natural law, the content of which he viewed in the manner of Rousseau, either as a logical form of positive law or as a purely regulative idea. In either case, by consistently denying the right of revolt against the established order, he attributed direct compulsion only to positive law. The same tendency to reduce natural law to the law of reason (*Vernunftrecht*) became more emphatic and precise in Fichte's more mature writings, in which his earlier terminology as epitomized in the title *Grundlage des Naturrechts* was replaced by the new term *Rechtslehre*, or doctrine of law.

In addition to the predominantly individualistic interpretations of natural law in the seventeenth and eighteenth centuries there was a significant, if less widely publicized, current of speculation which conceived natural law as rooted in the social group. Grotius, referred to by his contemporaries as a "socialist," derived from this doctrine of a social natural law his theory of international law. The most profound and original statement of the theory of a social natural law is to be found, however, in the writings of Leibniz, whose followers, particularly Wolff and Nettelblatt, expounded even more explicitly the theory of the innate laws of the group and their function as limitations on the power of the state. Schlözer, working from the same basic premises, drew for the first time a distinction between the two opposing concepts of civil society and political society. The physiocrats, applying the theory of the social natural law to

the new field of political economy, postulated an *ordre social naturel* of production, a domain fenced off against authoritarian state interference. As defined by its distinguished line of exponents social natural law is primarily law which "protects and gives assistance to natural and necessary societies"—among which are included such a variety of groups as family, commune, occupational association, town, church, state and international community. The rules of this natural law derive either from the ethos of the group in question or are to be deduced, *ex ratione status*, from a consideration of the concrete social realities prevailing within the group. In the development of this type of doctrine progressively greater importance was attached to the latter method of deduction and at the same time it was recognized that every voluntary association was likewise the subject of a social natural law; whence it followed that the social natural law became reduced in the end to the autonomous positive law of the various groups. The theorists of the social natural law may thus be said to have transcended the dualism between natural and positive law by setting up a hierarchy of manifold particular orders of positive law.

The reaction of the nineteenth century against natural law formulae is traceable ultimately to Edmund Burke and to the numerous romantic theorists in Germany and France, who, like him, were seeking some corrective against the atomistic individualism and abstract rationalism which they identified with the doctrines of the revolutionary ideologists in Paris. The most precise and systematic expression of this reaction is to be found in the writings of the historical school of Savigny and Puchta. It should be noted, however, that the founders of this school of jurisprudence, for all their emphasis on traditionalism and historicism, distinguish between law established by authority and the living law springing directly from the collective conscience of the people. Custom, to which these jurists attached such a great importance, is not merely traditional usage but also this direct juridical intuition of the people. Thus Savigny and Puchta, while giving it an altogether modern tinge, preserved one of the essential motifs of natural law, namely, a dualism between the law which is fixed in advance and the living spontaneous law or, stated in more general terms, between the reflective and spontaneous elements in law. Although Savigny and Puchta limited strictly the import of this distinction in restricting the living law of the modern period to the law of the jurists,

their Germanistic successors, headed by Beseler, draw the broader logical conclusions implicit in the distinction.

The efflorescence of positivism around the middle of the nineteenth century intensified the already widespread animus against the rationalistic apriorism of the older natural law systems. But the relentless attack upon all vestiges of natural law was the work much less of the partisans of positivist sociology than of the representatives of juristic positivism, who sought to limit the field of the jurist to technical analysis of the law established by the state and applied by its tribunals. The explanation of this hostility is to be sought primarily in the exaggerated étatism of the jurists themselves, who strove to reduce all law to the will of the sovereign state.

At the end of the nineteenth century and even more pronouncedly during the early years of the twentieth the emergence of unforeseen juristic institutions and of new social tensions which could not be resolved by reference to the rigid categories of the traditional body of law brought strikingly before the state tribunals the inadequacy of law promulgated in advance as a means of providing a solution for the vast number of complex cases. In this dilemma interest began to turn once more to the philosophy of law and to juristic sociology. There arose various groups, dedicated to such causes as the "renaissance of natural law," "free law" (*Freirecht*) and "sociological jurisprudence." In Germany the neo-Kantian Stammler postulated a "natural law with variable content," the function of which is to provide an instrument for criticizing the existing body of positive law. The "idea of law," which is to serve as this criterion, is purely regulative and is carefully distinguished by Stammler from the a priori notion of all law. François Gény in declaring war against the "fetishism of law" appealed to "free scientific research," distinguishing between the datum and the construct in the law and thus finding by intuition "the irreducible rational data of natural law." In this way the judge would be able to fill in the frequent lacunae which are to be found in the positive law promulgated in advance. The representatives of the *Freirecht* school have taken a more dynamic position, insisting that the spontaneous and living law defies reduction to any rational datum. There are also certain modern jurists who posit an objective rational law or natural law lacking a concrete fixed content but nevertheless based on certain essential principles which are eternal—a position held likewise by

the neo-Thomist group of jurists. The confusion of schools has at least made clear the fact that there is general dissatisfaction with the positivistic jurisprudence of the nineteenth century and that a widespread effort is being made to salvage the more valid elements in the older doctrines of natural law.

NATURAL ORDER. *See* NATURAL LAW.

NATURAL RESOURCES. Resources are those aspects of man's environment which render possible or facilitate the satisfaction of human wants and the attainment of social objectives. They are thus distinguished from resistant or harmful aspects of the environment and from neutral or inert environmental aspects, which affect man's achievements neither favorably nor unfavorably. In the narrow sense natural resources are original aspects of nature untransformed by man, such as air, water, sunshine and wild animal and vegetable life, which spontaneously satisfy human wants. In a wider sense natural resources

comprise also the substances, forces, conditions, relationships and other aspects of nature which are transformed by man and underlie, shape, affect or inhere in that complex mixture of natural and cultural landscapes which constitutes the environment of modern man. By the development of new arts and new wants, by erecting a lofty structure of artifacts on the foundation furnished by nature, man provides the drive behind resource development and turns hostile wastes into cultural environments. While the universe may be finite and hence the totality of potential resources may be a fixed entity, that portion of the universe which at a given place and time is available for human use is not a fixed entity but in constant flux. Every change in human want patterns and in social objectives, every invention and increase in man's control over nature, constantly revises the criteria of availability and ordinarily tends to enlarge the aggregate of available resources. Man and his resources are functional reciprocals.

The appraisal of resources varies with the standpoint of the individual and of organized social groups. While the satisfaction of basic individual wants and the maintenance of standards of living are prerequisites to group life, there are social objectives which transcend the limits of individual concern. Since the group is a succession of generations, the social appraisal of the environment as the basis of group continuity reckons with longer time units, takes a longer range and hence tends to favor a slower tempo of exploitation and often also a fuller utilization of resources. In many fields social and private interests are mutually interdependent or supplementary; in others they simply exist side by side; in still others they are antagonistic. Whether in the case of conflicting interests the social will prevails over the private interest or whether the reverse holds true depends on the social order which happens to exist at a given time and place. Under an exchange economy price is the chief regulator of resource exploitation, modified by the degree of competition or monopoly which prevails and by the conditions of supply and demand. In time, however, the social appraisal of resources as the basis for the fulfilment of social objectives assumes increasing significance. The two extremes appear in nineteenth century United States, with its unrestrained individual exploitation of resources, and in Soviet Russia, with its insistence upon the planned social utilization of resources.

The functional interpretation which stresses man's active participation in the determination of resources is not a denial of his dependence on nature or of the importance of the geographical factor in history. Because man has developed the arts and the sciences and has stacked tier upon tier of cultural superstructures on the foundations of nature, original nature is not therefore necessarily of less significance to the industrialized peoples of today than it was to the primitives who faced nature barchanded. The arts and sciences give new meanings to nature, culture lessens the impact of nature on man and diverts the forces of nature into new channels; but culture, by multiplying the points of contact between man and nature, enlarges rather than reduces the significance of nature. Certain basic aspects of nature moreover remain well nigh unchallenged as determinants of the availability of resources. The soil is still the greatest agency for the transmutation of matter; the arctic and antarctic are as hostile to settlement as they were thousands of years ago; for every square mile of arid or semi-arid land that the skill of the irrigation engineer and the patience of the plant explorer and plant breeder have added to man's domain, an infinitely greater number of square miles remain barren waste; heavy industry continues to cling with considerable tenacity to the coal and iron regions. Basically human life is as dependent on natural resources as it was in the beginning of the history of the race, and there are definite limits on the ability of man to emancipate himself from the limitations of nature, although population growth and the qualitative refinements of civilization are now largely affected by man's ability to control certain forces of nature.

The history of the social utilization of natural resources can be roughly divided into three stages. The first, still shrouded in the mists of the past, is marked by man's dependence on the bounty of nature. During the second stage man applied his labor, at first barchanded, then equipped with tools, to coax nature into granting him favors more bounteous in amount or more varied in kind. During the third stage man not merely applied his effort to the specific task of production but spent an increasing part of his labor on more or less permanent changes in the natural environment (the temporary irrigation ditch, for example, yielded to intricate canal systems and monumental rice terraces). While probably all parts of the earth capable of supporting a full fledged civilization have passed

through these stages, the development appears most clearly in countries of the New World, particularly the United States. In the pioneer or exploitative stage the chief reliance of man is on natural resources or land; the isolated pioneer, inadequately supplied with equipment which would render his labor more effective, wastefully utilizes the few aspects of nature which appear as resources and destroys the many which appear as resistances. As waves of immigrants changed the man-land ratio, the actual amount of human labor that could be performed increased, because of population growth and of the concomitant division of labor. Population growth also tends to promote an expansion and refinement of demands, which invest widening circles of "land" with utility and thus enlarge the supply of available resources. This development stage is followed by a maturity stage during which capital, the permanent improvements of the natural landscape and the mechanical equipment of production, assume increasing importance; it is today infinitely more important than it was in the pioneer stage of American history.

Out of the maze of forces which bring about these shifts in the proportional relations of one factor to another, changes in population pressure and changes in the availability and utilization of energy emerge as among the most important. The two are closely interrelated, organically and functionally. Supported by new or more refined forms of energy, man can spread out, roam farther and subject wider areas and deeper strata of natural resources to simultaneous and coordinated exploitation. The availability of energy is of supreme importance in resource exploitation. Man, unlike other living organisms, can appropriate outside, or "foreign," energies for purposes of work. With their aid and only because of their aid, he can transform natural landscapes into cultural landscapes and create an environment in which machinery is increasingly dominant.

The forms of energy utilized by man fall into two groups: animate, or muscular, and inanimate, or mechanical. Up to the industrial revolution all civilizations depended largely on animate, or muscular, energy released by men or beasts. Inanimate energy was used in the form of fire, water and wind power but under such inadequate human control that only small amounts could be applied and then generally only as a supplement to, not a substitute for, human labor. The shift from almost exclusive reliance on ani-

mate energy to widespread use of inanimate energy since the industrial revolution marks a major change in the energy basis of modern civilization and a turning point in resource utilization.

Man and beast can live and work only so long as they are adequately supplied with food or feed and the other necessities of life. Food and feedstuffs are organic in origin and can be produced in adequate amounts only with the aid of soil, water and sunshine, which are consequently not merely vital to pre-machine, or vegetable, civilization but its very basis. Before the industrial revolution land therefore was regarded as the major form of wealth, its ownership assuming unique significance. The exploitation of the land in the sense of surface, especially of soil, was the occupation of the overwhelming majority of all peoples. Clothing materials were universally made from animal or vegetable substances. Only minerals found near the surface were widely used, mainly in pottery, the construction of dwellings and the building of roads. Metal was used only in relatively small amounts, mainly for utensils, tools, weapons and armor and as media of exchange. Craftsmanship, mining and metallurgy, commerce and finance, were supplementary to and dependent on the all important primary and genetic activities of soil exploitation. The ruling and privileged classes, including warriors and priests, were supported by the tiller of the soil, the hewer of wood and the drawer of water.

The processes of production have been revolutionized by the steam engine, the water turbine and the gasoline motor, making industrially available the crude energies of the mineral fuels and of moving water, and by the dynamo, which transforms semicrude energy into the refined energy of electricity. This has radically altered the criteria of economic and political power and remade the resource map of the world beyond recognition. The land, in the sense of surface, situs or soil, is no longer the strategic resource and the major form of wealth. Its place has been taken by coal, petroleum and other sources of inanimate energy and the metals needed to harness and to apply these new energies. Thus industry, using stored up solar energy and metals, both drawn from the subsoil strata of the land, has gained the ascendancy over agriculture, using current solar energy and the living energies and substances of fauna and flora. Inanimate energy has triumphed over animate, dead substance over living matter, mechanism over

organism. While as late as 1750 metal industries did not play a major role anywhere, being overshadowed by textile, clothing, leather and food industries, today the metal industries have gained the ascendancy not only in the industrialized countries but also in world affairs in general.

Since metals and the metal equipment of industry are durable, capital goods have assumed unprecedented dimensions and significance. Both mineral fuels and metals permit of greater accuracy in their measurement, treatment and use than the living energies and substances of the vegetable and animal kingdoms; and therefore science, dependent on accurate measurement and observation, has developed to remarkable perfection. The new energies have mobilized men and goods alike, lengthened the reach of the merchant and extended the boundaries of market, money and credit economy to the far corners of the earth. The arts have become progressively dynamic and have thrown the entire process of resource utilization into alternating phases of rapid expansion and violent reverses. Growth of leisure, greater mobility, rapid change and increase of wants, coupled with a decline in the sense of economic and social security, have promoted a new attitude toward population increase, which through birth control and other ways of reducing the birth rate is materially changing the man-land ratio.

The resource pattern underlying vegetable civilizations is a working combination of fertile soil, adequate rainfall properly distributed or an adequate supply of irrigation water, and climatic conditions favorable to the growth of specific crops. The resource pattern underlying machine civilizations is a working combination of energy factors (coal, gasoline, water power) and metals (particularly iron and copper) and a social organization adjusted to such a resource economy in terms of mobility and engineering and labor reserves. While the former pattern is fairly common, covering possibly two fifths of the earth's land area outside the arctic and antarctic, the geographical and social prerequisites of machine civilizations are concentrated in a few places. It is true that the availability of minerals varies with changing arts and sciences; but for the present there can be no doubt that the regions bordering the north Atlantic, especially northeastern United States, Great Britain and northwestern Europe, possess a natural endowment for the development of heavy industry and hence of industrial civilization far superior

to that found elsewhere. Possibly new centers may develop in western Siberia, especially in the Kuznetzk-Magnitogorsk area, and in India; other Asiatic centers of heavy industry are of secondary importance. Machine civilizations are highly concentrated in accord with the concentration of basic natural resources.

Machine civilizations moreover are possessed with a drive toward expansion which leads to colonial rivalries between competitive industrial nations, to aggressive foreign investment policies and to armament rivalry and other concomitants of imperialism. Before this drive agricultural countries are relatively helpless; their resource pattern is inherently weaker than that of the industrial countries, at least in a world wide price economy. A country richly endowed with the mineral resources necessary for power driven machine industry can build up an economy infinitely superior in a material sense to the economy of a vegetable civilization dependent upon animate energy. Inanimate energy can be concentrated in quantities far in excess of any energy display of which vegetable civilizations are capable. It can be speeded up more and sustained longer, greater energies help to make better and stronger materials with which to harness still greater energies, and man can be relieved of much of the drudgery of physical labor. Largely because of this superiority of the mineral resource pattern the peoples who happen to possess workable coal and iron combinations rise to a position of world dominance, economically, financially and politically. The modern world economy thus becomes a resource hierarchy; that is, a hierarchical order in which strength and weakness are derived from the resource patterns underlying cultural development. In this system of staggered power surplus capital, derived from the increasing productivity of machine industry during times of expansion and from the profit made in trading the relatively scarce and controlled products of industry for the abundant and uncontrolled products of agriculture, dominates the central zone occupied by the cardinal industries—power, steel, coal, petroleum, electricity, copper, railroads and automobiles—while agriculture is thrust into a peripheral zone dominated by the central industrial zone. The great tropical plantation industries occupy a middle ground, the perennial nature of plants such as rubber, coffee, camphor, quinine and cocoa resembling in many respects modern overhead manufacturing industry. The central industrial zone corresponds also

to a central political zone of highly industrialized countries which dominate and exploit the agricultural countries and own or control their basic metal, petroleum and other natural resources; national control of strategic resources by the imperialistic interests becomes international.

While the masters of industry reach out to the four corners of the earth to acquire supplementary mineral wealth and actively enter the field of tropical plantation industry and of forest exploitation in the colder regions, they carefully stay out of cropping and animal husbandry. These industries are too competitive to attract big capital. Those who control the movements of capital may at times, consciously or unconsciously, act in a manner which keeps agriculture competitive, stimulates output and depresses prices. Among the devices which produce these effects is the construction of railroads and dams. A railroad within a relatively short period of time will turn a wild prairie into a new granary which throws on the world market quantities of wheat and other foodstuffs far in excess of the absorbing capacity of the existing demand, with the result that agriculture in new and old regions alike is thrown into turmoil. In general and normally capital flows into enterprises which stimulate the output of agricultural staples, aggravating and internationalizing competition.

Thus two kinds of capitalistic penetration must be distinguished, which might be termed absorption and subjugation. Through integration, including holding company devices, interlocking directorates and centralization of financial control, industry increasingly absorbs the mining industries furnishing its raw materials, especially iron, coal, petroleum, natural gas, copper, bauxite and other metal ores, as well as timber and water power. Moreover through mutual dependence for services and supplies and for utilization of by-products and waste products many industries are closely interrelated. This agglomerative trend, however, does not extend to agriculture. Neither the flour milling industry nor the baking industry absorbs wheat growing; the cotton textile industry does not acquire cotton plantations; the woolen and worsted industries do not enter sheep raising; the cigarette manufacturing industry leaves tobacco growing severely alone, although cases are known of crop lien or similar loans made to encourage output. A middle ground is again occupied by the tropical plantation industries: tire and sugar manufacturers acquire rubber and cane plantations, the United Fruit Company

grows bananas, and the investments of soap and margarine manufacturers in the production of tropical fats may be expected to expand in the future. Absorption generally involves control of supply, at least attempted control; subjugation works through stimulation of supply. Whether capitalistic penetration takes one form or the other depends largely on the extent to which the output of commodities can be controlled and on the amount of capital equipment required for production and marketing.

These developments, a product of the transformation of the resource basis of civilization, have profoundly altered the relations of agriculture and industry. So long as agriculture was inefficient and therefore large numbers of peasants or farmers were required to feed and clothe the world, a very real community of interest existed between agriculture and industry. When science and mechanization vied one with the other to increase the efficiency of agriculture and as a result it became possible for a small minority of farmers to feed the world, the aggregate of their purchasing power was correspondingly reduced and industries stood to gain more from lower prices of foodstuffs and agriculturally produced industrial raw materials than from a sustained prosperity of the rural population.

The tendency toward progressive concentration of power in the masters of the basic energy and machine resources is heavily reinforced by the characteristic economic and social developments of capitalism. Among the more important are corporate organization and management, which accumulate scattered funds and diffuse risk; the profitable nature of industrial integration and monopolistic combinations; and the increasing yield of surplus capital pressing for investment. Above all industrial activities are on the whole more capable of controlled adjustment of supply to demand and are therefore less subject to unprofitable output and prolonged depressions than are agricultural activities. Because of the organic origin of their products and of improper institutional arrangements the production of coal and petroleum, especially in the United States, is still in a state of confusion, and has not yet reached that state of profitable stability characteristic of similar resources. Some manufacturing industries, like cotton textiles, especially the coarse goods division, are so closely connected with an agricultural raw material base that they reflect its uncertainty and weakness. In general large capitalistic developments flourish most on the firm basis of mineral

control. This control is facilitated by the reduction of the number of deposits usable under large scale capitalistic production methods; thus many iron ore deposits which were important before the advent of the "monster stack" and the by-product coke oven have ceased to be resources.

National economies differ widely in accordance with the nature of their resource bases. While it is true that no nation can boast of an endowment with natural resources so complete that it can with immunity shut itself off from the rest of the world, some nations are much closer to such a position than others and could support a balanced national economy better than most other countries. To what extent a nation so endowed should strive toward self-sufficiency or to what extent it should forego the opportunity of balanced economy in the interest of interregional and international specialization is a crucial question of international economic policy. Few if any other regions of the earth, with a single political control and a homogeneous culture, possess an endowment of natural resources comparable to that of the United States. Many regions, on the other hand, such as deserts, mountain ranges, tropical rain forests, jungles, arctic wastes and similar landscape types, are so inadequately endowed with natural resources that settled social life cannot be supported. Between these extremes there is a large variety of types which could be arranged in an ascending or descending order, indicating the degree of adequacy or inadequacy of the resource endowment. An appraisal of regional resources, however, must also consider the influence which geographical, historical and other factors exercise on institutional developments and the formation of cultures. Cultural borrowing moreover permits many regions to enjoy institutional advantages which are impossible on the basis of their own geographical endowment.

Regions which, because of their coal and iron resources, can develop heavy industry may be placed in the category of first class powers, even if their agricultural resources are inadequate, because they can exchange machine products for agricultural raw materials and foodstuffs. The United States, however, has in addition large internal agricultural resources, while Great Britain has similar resources in its overseas possessions. The relationship existing between the industrial, commercial and financial interests of Great Britain and its possessions producing agricultural, pastoral and other raw materials is

comparable to that existing between the highly industrialized areas of the United States and the "provinces" producing agricultural and other raw materials. The national unity between industrial and agricultural areas, characteristic of the United States, has as many advantages and disadvantages as the non-geographical and looser political unity characteristic of the British Empire. Judging from present production records and trends, apparently only Russia and possibly Canada are nations which possess a balanced industrial and agricultural resource endowment.

While India is one of the world's chief agricultural countries and also possesses a workable combination of iron ore and coal, her climatic conditions and population density offer considerable resistance to full fledged industrialization and the accumulation of large surplus capital. Moreover the coal and iron resources, while considerable when measured absolutely, appear far less impressive in relation to the enormous population. China also possesses iron ore and coal, but these resources are so placed that early large scale exploitation seems unlikely; in general the remarks made about India apply within limits to China as well. These countries are the region of vegetable civilization par excellence, and it is extremely difficult to develop an industrial civilization in areas which for centuries have been dominated by the religions, philosophies and social organization characteristic of vegetable civilization.

Next to the first class powers as here defined rank countries, such as Germany, France, perhaps Italy, and to a lesser extent Spain, which possess at least one of the basic resources of machine industry, either coal or iron ore. Wherever one of these resources is available at home and through international trade can be supplemented with the others from outside sources of supply, balanced industrial systems can be developed. The extent to which a people avails itself of such opportunities depends on an infinite number of imponderables produced by historical, economic and national development. Germany before the World War, because of control over the ore of Lorraine and the coal deposits of the Ruhr, was in an exceptionally favorable resource position; the loss of Lorraine has resulted in a decided national deficiency of iron ore which neither the intensive exploitation of domestic ores nor the control and import of foreign, especially Swedish, supplies can wholly compensate.

While infinitely more efficient economically than vegetable civilization, machine civilization suffers from at least two serious weaknesses. In the first place, it is vulnerable because of regional specialization and interdependence. It is comparable to a carefully adjusted complex mechanism which runs well while working but is easily put out of order. The political measures designed to safeguard the system against disturbances from the outside, such as navies, colonial acquisitions and imperialistic policies, have not yet definitely proved their worth and wisdom. The second weakness stems from the one-sided reliance upon exhaustible, or "fund," resources. The vegetable civilizations of China and India owe their remarkable longevity in large measure to the fact that they rest mainly on "flow" and "revolving fund" resources, such as renewable soil fertility, natural water supply and sunshine. An industrial system which rests on coal, petroleum, metals and other fund resources is built on a far less durable foundation. At least until recently, however, progress in the technique of exploiting and utilizing mineral resources and the discovery of new deposits have gone far to counteract the economic effects of exhaustion.

So far the exhaustion of mineral resources has resulted not in the breakdown of an industrial economy but merely in shifts in the relative position of various industrial nations. The best example of this development is furnished by the English coal mining industry, which at one time, largely because of the proximity of coal deposits both to domestic iron ore deposits and to tide water, possessed superior advantages—and gave England its early industrial supremacy. Today, however, England finds it difficult, probably in part because of diminishing returns from her coal mines, to compete with younger industrial countries working virgin coal fields. Similarly the advantages of the British iron industry, which once depended largely if not exclusively on domestic ore supplies, have been adversely affected by the gradual depletion of at least the most workable portions of these reserves. Much more extreme is the case of the British tin industry, whose domestic ore basis has been almost completely exhausted. To be sure, by means of capital exports and by means of political, financial and commercial control over mineral deposits scattered throughout the world, particularly in Burma, the loss of domestic supplies has been largely compensated. In fact domestic supplies are not necessarily preferable to foreign supplies except in so far as dependence on

outside supplies tends to render a country's position more vulnerable. Such compensation through foreign control for the loss of domestic supplies in general, however, works much more satisfactorily in the case of metals than in the case of coal. While industries may survive, perhaps even thrive, on cheap domestic coal and on imported metals, the reverse is far less feasible. Great Britain's economic difficulties during the past decade are traceable to a variety of causes, including the shift from coal to petroleum and water power, but the progressive exhaustion of the most accessible and most easily worked mineral deposits must be included as an important contributing factor.

There are two methods by which a country can round out its resource basis. One method, open only to politically and financially powerful countries, is to gain control over complementary resources in other parts of the world. Thus, British capitalistic interests have secured control over important oversea deposits of gold, silver, iron, copper, tin, lead, zinc and other metals. Capitalistic interests in the United States have gained similar control over foreign mineral reserves, a policy also pursued more or less by France, Belgium, Holland and pre-war Germany. This method, which up to now has resulted in bringing almost all the world's known mineral deposits of major importance under the control of North American or northwestern European capital, is fraught with many dangers which in the future may increase and result in a serious conflict between the rising nationalism of economically backward countries and the vested interests of the great imperialistic powers. Japan pursues a similar imperialistic policy on the Asiatic mainland.

The other method makes use of modern science. It is most strikingly illustrated by inventions and processes which utilize domestic resources more rationally and more completely. These include hydroelectric power, long distance transmission of electricity, the hydrogenation or carbonization of coal, and other ways of mobilizing energy supplies; and the manufacture of methanol from coal, of rayon from wood pulp, of synthetic camphor from turpentine and of nitrogen from air. National resources, in other words, can be enlarged extensively by acquiring control over foreign supplies or intensively by enhancing the resource value of existing domestic reserves; both practises flourish in highly industrialized countries. As science advances the resource position must be determined by the

intensity of exploitation as well as by the extent of natural resources.

Fuller exploitation of basic resources is accompanied by more complete utilization of by-products and waste products and the re-use of waste, junk and scrap. Besides calling for a reappraisal of the relative position of various powers, such technological developments have a vital bearing on the rate of exhaustion of mineral resources. Thus the successful reclamation of rubber reduces the superior position of the countries which control or have easy access to the regions producing rubber and correspondingly improves the position of countries which have had to purchase imported rubber under a handicap. Similarly the growing importance of iron and steel scrap and of other secondary metals has correspondingly affected the relative position of primary raw material producers and of countries which, as a result of past imports, have built up domestic reserves of secondary supplies.

The effect of scientific progress on the rate of exhaustion of limited natural raw material supplies is strikingly illustrated by recent developments in the petroleum industry. By means of hydrogenation the petroleum refiner has greatly increased the control over the yield of marketable products, especially gasoline, from crude oil and has solved the most pressing technical problem. When the legal and other institutional problems of the petroleum industry will likewise have been solved, a much closer adjustment of crude oil production to market demand will be feasible and the rate of depletion of petroleum reserves in the ground may be materially reduced. It is conceivable, however, that if lower costs are translated into lower prices and greater demand, the rate of depletion of petroleum reserves may not be retarded but even accelerated.

In addition to the close connection between certain resource categories and economic and political power a close relationship exists between resource combinations and cultural development. The habits of thought, philosophy and religion of peoples reflect to some extent the resource basis upon which their economy depends. This relationship, however, has been affected by the cross fertilization, or hybridization, of cultures and the transfer of cultures through migration; therefore direct relationships between regional, national or racial cultures and their respective resource foundation can hardly be expected. Nevertheless, a certain general interdependence between resources and cultural

developments can be traced. The defeatist character of some oriental philosophies and religions may, in part at least, be explained by the rigid limitations which, in the absence of compensating or modifying elements, a vegetable resource basis places on the cultural superstructure which it can support. On the other hand, the dynamic force peculiar to the power-metal-science bases of the civilizations of the younger industrial nations may explain much of their characteristic progressiveness and optimism. Inanimate energy mobilizes and multiplies contacts between heterogeneous elements and thus makes change not only possible but almost inevitable.

There is also a relationship between resources and the lines along which the inventive genius of nations tends to operate. The distinct difference between the general trend of European and American inventiveness seems to reveal an equally distinct difference in the resource bases on which European and American industrial civilizations rest. Europe, having been settled before the industrial revolution, began the process of industrialization with a higher population density and therefore with a man-land ratio quite different from that in the United States. The problems which the people of the United States faced during the nineteenth century were largely problems of labor scarcity, time scarcity and excessive distance. The problems of Europe sprang generally from the inadequacy of natural (non-human) resources. The American inventor consequently specialized in labor saving, time saving, space conquering; the European inventor worked toward a more economical and rational utilization of natural resources, supplementing them by synthetic and other artificial substitutes. The reaper, the sewing machine, the electric eye, are labor saving devices; the telephone and electric light are time saving devices; the airplane is a space conquering device—all of these were invented or perfected in America. The open hearth and the Bessemer converter are ingenious instruments of fuel economy; hydrogenation serves to broaden the scope and usable yields of natural resources; synthetic products are supplements to or substitutes for natural products—along these lines Europe excels.

A relationship exists moreover between scarcity or abundance of resources and social and political institutions. In general one may say that the extent of individual freedom among members of a social group is a function of its political and economic security. Nowadays when

naval and military strength is itself largely dependent on the availability of large amounts of fuel and metals and of scientific knowledge, both economic prosperity and political security are contingent on an adequate resource endowment and its mechanical exploitation. Under special circumstances, however, an abundance of life supporting necessities freely furnished by nature may encourage a system of rigid social control. Thus the possibility of white labor escaping from the obligations of indentures into the open frontier regions has been numbered among the factors which explain the introduction into and the rapid spread of Negro slavery in the American south. Similar conditions are said to have led to the development of the *mir* in seventeenth century Russia. A sharp distinction must be drawn between the effect of scarcity or abundance during the formative periods on the development of a social and political system and their effect on institutional developments in a maturer society.

The prevailing attitude toward social control and individual freedom respectively is generally reflected in national policies affecting resource exploitation. Periods marked by extreme severity of restriction alternated with periods of almost equally extreme indulgence in unrestricted exploitation. These shifts of policy are usually associated with changing uses of natural resources, causing scarcity at one time and giving the appearance of abundance at other times. The laws governing the use of water illustrate with particular clarity the relationship of relative scarcity or abundance of resources to the development of institutions; in the United States water laws vary regionally in close consonance with variations in the natural adequacy or inadequacy of water. Strong governments with feudal traditions impose limitations on the exploitation of mineral wealth; thus in continental Europe the mineral law generally reserves considerable rights to the crown or state. In the United States the legal theory that subsoil minerals belong to the owner of the surface land resulted in unrestrained exploitation, which led in some instances to truly chaotic conditions. In general a more or less unrestricted exploitation of natural resources prevails during the earlier stages of industrial development; during later stages, when the value of resources is more clearly appreciated and the dangers of exhaustion become manifest, the tendency is for the state to regulate the rate of exploitation, and demands for conservation and socialization arise.

As a result of the economic and political effects of the World War the trend toward nationalism and national self-sufficiency is being intensified. The League of Nations and other organizations interested in the revival and promotion of world economy have made efforts to counteract the nationalist tendency, with but meager results. That free trade interpreted as a *laissez faire* policy in the international economic field, if supported by an equally liberal attitude on the part of all major powers in the field of politics, is the surest way to bring about the most rational and most effective utilization of world resources is generally recognized and admitted. The emphasis, however, must be placed on the interrelation between the economic and political aspects of the problem. *Laissez faire* confined to the economic field is almost certain to strengthen further the position of the most powerful industrial nations at the expense of agricultural regions. Unless therefore the world succeeds in setting up a political system which insures a planned and equal utilization of the world's unevenly distributed resources as well as the political security of weaker powers, there seems little hope for a reversal of the present trend toward increased nationalistic and imperialistic exploitation of natural resources.

NATURAL RIGHTS. The doctrine of natural rights can be traced back through mediaeval and ancient times. It acquired its main significance, however, in the English, American and French experience of the seventeenth and eighteenth centuries. Natural rights are possessed by individual human beings, not by corporate organizations; that is, the doctrine is a part of modern individualism. These rights form a system of value judgments erected into metaphysical absolutes. Their value and use as metaphysics and their relation to the specific historical situation in which they were formulated are both worthy of brief consideration.

The natural rights movement represents one aspect of the eternal human tendency to distinguish between what is and what ought to be; the element of right is definitely an ethical norm, an assertion that certain human desires have greater validity than, and must therefore prevail over, force or circumstances or mere being. The specific content of these desires, identified as rights, was given great effectiveness as propaganda by the alliance with nature. God was gradually replaced in the seventeenth and eighteenth centuries by the vaguer and perhaps more useful concept of nature. Natural rights acquired something of the prestige of physical, earthly existence, since one of the numerous connotations of nature is simply the external world. Thus the doctrine of natural rights could claim to be both a standard and a fact. Through the work of a long line of philosophers and jurists from the stoics to the scholastics, the law of nature had come to stand for the universal, the ordered, the "golden mean," as opposed to the particular, the accidental, the excessive, so often found in actual human life. Again, nature suggested also the extraordinary achievements of natural science; natural rights were felt to rest on the same basis as Newton's discoveries; and reason discerned these rights despite their daily violation, just as reason discerned the true movement of the earth despite its apparent immobility. In its early stages the doctrine also borrowed prestige from history. It was insisted that the specific rights claimed by Englishmen in their civil war as natural had been possessed by Englishmen since the Magna Carta and even earlier. When the doctrine passed over to France in the eighteenth century it lost this historical cast and came indeed violently to repudiate the past as a tissue of errors.

This setting aside of history subsequently scandalized many Englishmen, like Bentham

who repudiated the phrase natural rights but erected a system of values almost identical with that of the French revolutionists. So too Maine fulminated against the metaphysics of natural rights, sought inductively in the facts of history and found there the famous phrase "from status to contract," a singularly pithy summary of the main tenet of the natural rights school. It is important to realize that natural rights were the metaphysical translation of a definite value scheme, or a way of life. Other metaphysical principles—history, utility, heredity according to Darwin and Weismann—were also used to explain, defend and propagate this way of life. But on the whole the natural rights basis has held on firmly, especially in the popular and the legal mind, right through the nineteenth century. The doctrine of natural rights in the eighteenth century commonly made use of a supplementary doctrine, that of the social contract. This latter doctrine provided a useful link with previously accepted notions and helped explain the genesis of natural rights on earth. It was therefore valuable as propaganda. But the social contract had no necessary connection with natural rights and was indeed invoked by Hobbes to deny them.

The main factor in the specific situation in which the doctrine of natural rights arose, and which serves to explain its contents if not its form, was the growth of a powerful middle class engaged in business for profit. The feudal nexus, in which each man possessed a definite status; in which ownership was hedged about by customary limitations, by collective supervision, by ethical and religious ideas; in which warrior and priest were the privileged persons, had by the seventeenth century been pretty well destroyed, especially in England. In its place there had arisen a handicraft system of industry, in which the distinction between employer and employee was already clear, a large trading class used to business enterprise rather than to actual production or even supervision of production and a new agriculture organized on a capitalistic basis. The "free" laborer and the "free" capitalist, both at liberty to enter into a variety of specific and usually short term contracts, existed before it was discovered that this sort of freedom was a natural right. The doctrine of natural rights was evolved by a prosperous middle class, first, as a rallying ground against the already almost beaten feudal warrior and priestly classes and, second, after the final victory over these classes, as an authoritative codification of the

desires of the victors, a projection of these desires into a kind of religious absolute. The doctrine of natural rights is therefore not a theory, not an attempted description or ordering of facts, but a faith, the essential dogmatic basis of what Carl Becker has called the "heavenly city" of the eighteenth century.

Innumerable political theorists of the seventeenth and eighteenth centuries contributed to the codification of the doctrine. Here it is possible to say but a word on the two who clearly contributed most to this process as well as to the no less important process of disseminating the doctrine. Locke summarized beautifully the achievements of the Revolution of 1688, emphasized the right of resistance to oppression, gave to his whole theory a pronounced individualistic cast and, what is most important, firmly incorporated among natural rights the right of private ownership of property, ethically justified, because the owner has "mixed his labor" with what he owns. Rousseau, although in a good deal of his work he apparently tried to push beyond the natural rights doctrine into political psychology, was none the less the leading propagandist of the doctrine in the crucial period of the American and French revolutions. He added little to its actual dogmas, but he did much to give it proselyting strength. His identification of virtue with feeling and ignorance, with the homely, simple life of the people; his bitter attack on the corrupting force of conventional taste, manners, intelligence, did much to bring middle class morality into a fruitful emotional union with natural rights. Briefly, Rousseau gave the doctrine of natural rights, hitherto endowed with the solid and effective but imaginatively limited prestige of nature as reality, as uniformity and as the "golden mean," the additional prestige of nature as mystic strength, as *magna mater*. This union of rationalism and mysticism gave the doctrine extraordinary explosive force during the French Revolution. Subsequently western European and American countries learned to control and enlist in the service of stability this mysticism of natural rights, much as the Catholic church controlled and used such mystic outbreaks as that of St. Francis.

Like all such doctrines that of natural rights, although it arose from the specific needs and ambitions of a group—the middle class—had to be popularized even in that class by organized effort; and of course among the lower classes a still more conscious propaganda had to be car-

ried out. In seventeenth century England religious groups and political parties were already well enough organized to serve this purpose. In eighteenth century France an extraordinarily complete system for teaching the people their rights was worked out—the system studied by Cochin under the name of *sociétés de pensée*. Once the middle classes were victorious, the governments could of course take up this task, especially in the schools, a process notably successful in France and in the United States. In continental Europe nineteenth century liberal groups, Masons, *Burschenschaften* and many others spread the doctrine of natural rights.

The chief codifications of these rights by formal political action are: the English Bill of Rights of 1689; the bills of rights attached to the American state constitutions, of which the earlier ones, like those of Virginia and Pennsylvania (1776), were of great importance as patterns; the French Declaration of the Rights of Man and the Citizen (1789); the first ten amendments to the Constitution of the United States (1791); the Declaration of Rights in the stillborn French constitution of 1793 (passed at the height of the social revolution, this declaration has certain almost collectivist elements, notably the right to public poor relief, a declaration of social solidarity and so on); the Declaration of Rights and Duties in the French constitution of 1795. The nineteenth century saw many similar bills of rights in almost all civilized countries, but these added little of importance.

The rights thus enumerated vary somewhat from document to document. Those in the French tradition commonly fail to include a right of association, while those in the Anglo-Saxon tradition are somewhat more tolerant toward group life within the state. Otherwise the rights enumerated may be briefly summarized as liberty, with liberty of worship, of speech, of the press, of public meeting singled out for special mention; equality, usually defined as equality before the law; property, which apparently needed no definition; a number of vague or pleonastic rights, like those of life, the pursuit of happiness, the *bonheur commun* in which the eighteenth century sought to incorporate its sentimental optimism; resistance to oppression. These rights were regarded, in Locke's terminology, as "inalienable": the individual could not surrender them, and the government could not infringe upon them. A right to labor is not enumerated. On the other hand, the right to life could be interpreted as giving

the individual at least an emergency claim on society for sustenance; and the right to property could, following Locke's own lead, be made to include a right to a reasonably free field for personal activity, for the sort of handicraft labor which Locke regarded as behind the creation of property.

When these rights were compared with the civil and criminal law actually enforced, even in the new regimes of Europe and America, certain discrepancies were clear. These discrepancies of course bothered only the extremely logical, who were very few, and the already discontented, who were not as numerous in 1800 as a century later. For the great majority of comfortable middle class people the gap between the bills and declarations of rights and actual law was of no more importance than the gap between the Sermon on the Mount and the routine of private Christian life. These discrepancies were roughly of two sorts. First, the enumerated rights were with difficulty reconcilable one with the other. They follow generally the antithesis between liberty and equality: if the laws let each man do as he wants to do, the very strong will ruin the very weak, and there is an end of equality; if the laws attempt to make each man as like his neighbor as possible, the eccentric will be suppressed, and there is an end of liberty. Second, enumerated rights may be more or less obviously violated in legislative enactments. A classic example of this is in the French constitution of 1791. The Declaration of Rights had asserted men to be born free and equal in respect of their rights; the constitution separated these free and equal men into "active" citizens who voted and "passive" citizens who did not, according to whether they paid a certain direct tax. The English combination laws of 1799 and 1800 or the American Alien and Sedition laws of 1798 can with difficulty be reconciled with the "inalienable" rights of the citizens of those countries.

Once consecrated as the metaphysical keystone of the social order produced by the victorious middle class, the rights of man acquired something of the fixity of religious dogma. But at almost the precise moment—roughly 1800, somewhat earlier for England, somewhat later for the rest of Europe and the United States—when the doctrine triumphed finally, the way of life from which its values had been built up was yielding to another way of life. The handicraft system was superseded by the factory system, and ownership was coming to be absentee

ownership, to be so far remote from any connection with labor that even the economists deserted Locke and explained interest on capital as the reward of abstention. Yet throughout the nineteenth century and into the twentieth, in the industrial countries, the doctrine of natural rights was used to defend a kind of property which in its extension, in its concentration in relatively few hands, in its very nature, was totally different from the property with which Locke and his followers were familiar. In general terms, a set of ideas with which one class had appealed to the ethical sense of humanity to secure its triumph at the expense of another class had now crystallized into a set of dogmas with which the newly victorious class consolidated its gains at the expense of a third class. 'Thanks to the marvelous power of the machine, however, and perhaps also to the development of the typical credit mechanism of capitalism, this triumphant class really gained far more than could have seemed possible in 1800. At the same time the gap between the new conditions and the old dogmas became increasingly obvious to all but the very interested or the very faithful. Some such general process as that outlined above—by which the liberal ideas with which a class fights its way into power become the authoritative dogmas by which it holds power—has often occurred in history. But the striking thing about this particular instance was the rapidity with which the doctrine of natural rights, become a dogma, was challenged by a new set of ideas, which were also provided with an ethical setting and used by a class struggling for power. Marxist socialist thought repudiates the rights of man and especially the right to property. Independent economists like Veblen have pointed out that men brought up with machines—the engineers and skilled machinists as well as the factory workmen—must now live a life so different from the life of the eighteenth century that they cannot even understand the doctrine of natural rights.

Yet the doctrine is still very much with us. Especially in the United States it has been used by the highest courts to protect private ownership against public regulation. The Fourteenth Amendment, notably, has been used to invalidate state legislation incorporating restrictions on private enterprise in the interests of the community. The concept of property as an inalienable right has allowed the courts to pass in judicial review acts of administrative bodies regulating public utilities. The general interest

seems to be able to proceed against private property only under the guise of a "police power." Perhaps it is an even more important fact that the ideology of natural rights has thoroughly penetrated into the literature, the arts, the educational systems of western peoples. It may be true that this ideology is utterly inappropriate to the machine age; it may even be true that its patent failure to correspond with real conditions prevents those conditions from being as satisfactory for human existence as they might be. It is certainly true that the logical implications of nineteenth century scientific materialism leave no room for the concept of right. But the doctrine of natural rights is not wholly logical, and that aspect of the doctrine concerned with individual property rights and with individual freedom to experiment was actually greatly bolstered by the biological determinism of Darwin and his immediate successors. The doctrine of natural rights is so solidly rooted in human experience, its prestige so heightened by the extraordinary expansion of the western world in the last century, that, like Christianity, it will probably have to be absorbed, rather than destroyed, by a new ideology.

NATURALISM is better called a point of view than a fixed doctrine or a particular set of dogmas; for the doctrines and the dogmas, varied and often contradictory, that have reasonably been identified as naturalism have depended

largely on the context in which they arose and the interests, moral, social or aesthetic, in whose service they were emphasized. In the broadest sense the term may be used to describe that type of secular thought, first historically formulated in ancient Greece, which tried to frame a theory of the universe, a cosmology which both should comprehend a unity of substance or of principle and in terms of that substance, principle or set of substances or principles should comprehend or explain the changes that appear to occur in the universe. Such a theory, first clearly and simply expounded by Democritus and the Greek atomists and taken over almost without modification by Lucretius in the first century B.C. in Rome, originated in the attempt to render the flux and superficial confusion and caprice of experience intelligible; it represented the first classic venture of thought to think through to some intelligible order in experience free from and, as in the case of Lucretius, in direct opposition to the presumptions of theology and myth.

The generic characteristic of all theories of naturalism, whatever be the detailed version of nature that any one of them gives, is the assumption or the attempted demonstration that there is an order; that the appearances and disappearances of objects and the movements of events do constitute a system, the terms of which need not be referred to anything beyond that system or order itself. By virtue of its insistence on the self-sufficiency of nature naturalism sets itself in opposition to "supernaturalism," which it regards as a contradictory notion doubling the natural universe with a ghostlike and capricious imitation of this same universe. Naturalism seeks the explanation of the universe in some form of elements, in some regularity of motion: the regularity not dependent on any prevision or intention of a being beyond the system; the elements, particles or substances being something given, something ultimate and unpredictable. The regularities are what they are, the elements likewise. They are referred to no explanation beyond themselves and they constitute all the explanation that may be given of any object or event. The assumed regularity removes caprice and isolation from objects or events. The objects cohere and events connect in a system. The assumed ultimate elements change the world from an apparent phantasmagoria, from an evanescence of appearances, to a permanence of ultimate elements whose combinations and permutations constitute at once the being and

the explanation of apparent and changing things. Such a conception of the universe yielded to the imagination of the Greek atomists and to Lucretius, as they yield to anyone who accepts it, numerous satisfactions not necessarily allied to one another. The cosmos becomes a cosmos, not a chaos. Unity is established amid variety, permanence amid change, an enduring and intelligible reality amid diverse and bewildering appearances. Order and recurrence are accounted for without resort to providential purpose or casual miracle. The universe becomes intelligible rather than puzzling, and out of the mist of appearances a daylight world of mechanism arises.

In ancient Greece naturalism took the form of a clear and simply formulated materialism. The ultimate elements were atoms, neutral and homogeneous in character; their motions were regular and in that sense absolute. The so-called billiard balls physics of the nineteenth century is a revival of that Greek type of naturalism which expresses itself in the form of materialism and mechanism—materialism from the point of view of the elements of which it is composed, mechanism from the point of view of the principles of its operation. But while materialistic mechanism is the most characteristic and familiar form of naturalism, it is only one form of it. Philosophic naturalism is not dependent on one theory of physics. The identification in many educated minds and in the popular imagination is largely due to the fact that Newtonian science and Cartesian philosophy managed to make a mathematical, mechanical, materialistic formulation so effective a principle of explanation and so effective a tool of intellectual and ultimately of practical control. But naturalism as a cosmology does not depend on its alliance to any particular formulation in simple materialism or in modern mathematical physics. If anything, it is more dependent on mechanism, or the assumption of some consecutive and regular order among events and regularity of conditions among objects, than on the assumption of any kind of stuff or palpable material. It is fundamentally a cosmology of a regular order, which order is identified with or as nature. From this point of view Spinoza is as much a naturalist as Democritus or Lucretius.

The conception of a necessity in the relations of things flowing from an ultimate uncaused cause, like any other naturalistic theme, excludes deliberate purpose or casual and interruptive miracle. On the other hand, the very regularity

of a mechanical scheme may be regarded (as by the deists) as both expressing divine reason and being intelligible to human reason. All materialistic systems of philosophy have naturalism as their matrix, but not all naturalisms are materialistic. Thus in the eighteenth century Baron von Holbach with his *Le système de la nature* and Lamettrie with his *L'homme machine* tried to extend the mechanistic hypothesis to the realm of biology and psychical or mental life as well as to the observable phenomena of the physical world. In the present age the attempt of behaviorists to reduce all explanations of conduct to elements ultimately material in their nature and mechanical in their relations is a modern version of the enterprise of mechanisms applied to all phenomena, including those less obviously or less easily reducible to mechanical and material terms. But once naturalism attempts to deal with life in a biological and in a psychical sense, it has to deal with problems which call for something other than the simple categories of a mechanistic materialism. Life is a process dynamic, creative and degenerative in character. The production and the presence of genuine novelty in the processes of life, the fact of creation or of creative adaptation and purpose, once it is included in the picture and in the analysis of nature, force naturalism to become less obviously, less crudely and less geometrically materialistic in character. Indeed the newer physics itself, with its resolving of matter into process and into the relations among "events," and the tendency among philosophical physicists to treat the physical universe in organic terms have introduced into naturalism categories that clearly demarcate it from materialism as to elements, from mechanism as to operation.

There are indeed certain types of naturalism that are even able to absorb idealistic elements, and there is nothing about philosophic naturalism that must of logical necessity exclude factors and categories and interests which often in the past have been set over by traditional materialists as mere appearance against the alleged reality of matter. Matter conceived dynamically is the locus and matrix of all objects, experiences, ideas and even ideals. A purely static mechanistic materialism excludes anything remotely resembling purposes, ends, fruitions. A dynamic naturalism that conceives of primary substance as in flux (Aristotle is a classic ancient and George Santayana a distinguished modern instance) thinks of nature not as moving accord-

ing to prescribed ends laid down in advance but as coursing to ends immanent in those movements; it considers ideals and fulfils the fruitions of natural processes. The acorn grows into an oak, the boy into a man, the bud into a flower, the tongue functions as speech, and the body realizes itself in the entelechy of the soul. Consciousness is a natural function of bodily life and flowers into dreams, ideals and purposes. There is no contradiction between the body and the spirit; the latter is the realization of the possibilities of the former. Art, religion, thought and imagination are functions of nature just as much as are breathing and digestion. "All ideals have a natural basis and all natural processes an ideal possibility or career." The opposition sometimes alleged to exist between the natural and the ideal depends usually on a restricted conception of nature in narrowly mechanical terms. Ideals in a dynamic naturalism are as natural as flowers or fruit, to which with reference to their conditions and origins in primary substance they may be very exactly compared.

While naturalism as thus far treated is largely a cosmology, the term nature and the term naturalistic have been used in somewhat different contexts. In ancient stoicism, especially in its Greek rather than its Roman formulators, nature was a name for a reasonable, or normative, order in the universe, which was not only a realm of being but a standard of action. The order of nature provided the basis for law and morals, and we owe to the stoic identification of nature and reason the notion of natural law (*q.v.*) and of a standard of goodness or virtue to be found by reference to the total order in the universe. In the eighteenth century, especially in Rousseau, nature came to be a normative term not so much in the sense of identification with reason as in the sense of identification with the alleged "nature of man" as uncorrupted by the arts and sciences of civilization. The natural man in Rousseau was set over against the artificial man of civilization, the goodness of natural man over against the corruption of the man perverted by civilization. In such a context nature is contrasted not with supernatural but with art. All contrivance is a modification of or an interference with nature and all institutions, arts, crafts and sciences are "artificial." In morals this has led, as it led in Rousseau, to an assertion of the spontaneous as over against the merely customary and conventional; in the fine arts to an assertion of the "simple, passionate, sensuous" as over against

the complex, formal and intellectual. Late in the nineteenth century naturalism in aesthetic theory came to be used for a time as identical with "realism," especially in literature, the emphasis laid on the brutally real, "the facts of life," as over against fantasies, prettifications and escapes. In ancient Greece at least naturalism was not incompatible with classicism, in the sense of a disciplined and harmonious representation of existence in art—nature seen with a disciplined eye and rendered with a controlled hand.

Broadly speaking, in the modern period, whatever be the special technical formulations of differing naturalistic philosophies, they agree on the whole in a general belief in scientific realism, in the utilization of the broad principles of physics and biology for explaining the universe, without any very critical examination of the underlying metaphysical assumptions of the sciences themselves or any very close examination of the categories involved in the special sciences or the methodology of science in general. Naturalism, like any other general cosmological point of view, has had certain important moral consequences and imaginative results. With respect to morals it has pointed to the relativity of moral standards and aimed to treat morals not as the manifestation of categorical imperatives but as the relative expressions of life and of associated ways of life under given conditions and as the reflection of given environments. In religion it has pointed toward either out and out atheism or at the very least agnosticism. But from the point of view of a naturalism not too mechanistically conceived (and it is at the present time being less and less so conceived) the spiritual life is itself a natural fact and deity, as the expression of the synthesis of possible perfections, is not incompatible with a naturalistic outlook in morals and metaphysics.

NATURALIZATION denotes both the act of admitting an alien to the position and privileges of a native born citizen and the process of being so admitted. It has a governmental aspect in that it is usually considered an act of grace on the part of the sovereign; but it has also a personal aspect, for occasionally it is regarded as a natural right of man. In modern times it has generally been a right established by the sovereign, its exercise depending upon the fulfilment of certain conditions. The concept of a naturalized citizen acquired its present legal connotation during the reign of Elizabeth, when there existed only natural subjects of the crown. Their relation to the crown was interpreted in quasi-feudal terms, through the requirement of an oath of allegiance. The importance of land tenure in the feudal order was long reflected in the inability of an alien to acquire real property, and the importance of the personal element in his inability to inherit; the desire for naturalization was greatly enhanced by the obvious economic advantages of escaping from these restrictions. In time, particularly after the American colonies had become an independent republic, the individual citizen as the constituent element of the modern national state took the place of the subject bound by allegiance to his natural lord. Accordingly naturalization has come to designate the process by which an individual becomes the citizen of another country or, to broaden the concept still further, that by which an individual becomes a member of another citizenry. Only in the latter sense can the term naturalization be applied to the city-states of classical antiquity and mediaeval Europe or to Soviet Russia.

The concept of naturalization like all other concepts of public law is molded by the prevailing idea of the state and government. There are vestiges of very ancient tribal conditions in the earliest forms of naturalization in Rome. Essentially a person could become a citizen only by becoming a member of one of the patrician families (*gentes*). This was possible primarily through adoption, or *adrogatio*, the latter alone presupposing the consent of the public author-

ity, the *comitia curiata*; adoption, probably a rather late form, made the matter entirely dependent upon the adopting individual. In order to appreciate the full significance of this process it is necessary to recall that the citizenry of ancient Rome was very limited, comprising only the members of the families of a small aristocratic class whose power rested largely upon their military function. Whole families, like the Papirii or the Julii, may well have been naturalized in order to replenish this warrior class; at any rate, such naturalization presupposed communities which had an internal structure similar to that of Rome, like those belonging to the *nomen latinum*. Ordinarily the consent of the foreign community was necessary unless it had been dissolved, such as that of the Quirinal. According to Mommsen, only the community of the *curiae* could naturalize a foreign patrician family. Plebeian families, even of Roman origin, could not be naturalized. After the Roman citizenry had been extended to include the plebeians, the naturalization of foreign individuals commonly took the form of conferring the plebeian status upon them. This process required an act of the sovereign power, the formal consent of the Roman people in assembly (*comitia centuriata* or *comitia tributa*) or the resolution of the commons (*concilium plebis*). The exercise of this power was often delegated to some magistrate, and the person or group of persons to be naturalized was not obliged to accept citizenship. Until the time of Caesar citizenship was conferred upon whole communities only by direct vote of the sovereign people; later it became the prerogative of the emperor. In all these cases it was possible to place restrictions upon the naturalized citizen, such as limitation of his voting privileges. There existed, however, a group of foreigners whose position was much more privileged; these were citizens of communities belonging to the Latin League. Such persons, at least those of the older Latin communities, could acquire citizenship merely by establishing their residence in Rome; until finally the attempt to abolish this privilege led, after the social war, to the conferring of citizenship upon all Latins and other Italian communities.

This act is a significant landmark in the evolution from city-state to world empire, from republic to monarchy. Although a retention of the old forms suggests the idea that citizenship was still conceived essentially in terms of personal right and duty, the citizen became in fact

the inhabitant of a territorial state, subject to an all powerful prince. Naturalization thus became a concomitant of residence within the particular territory. The ever widening grants of citizenship under the empire did not carry with them the extension of republican government as it had existed in Rome; these grants arose primarily from the financial needs of the emperor, for all citizens were subject to special taxes. The process was consummated when in 212 A.D. Caracalla naturalized all persons, except slaves, then resident in the Roman Empire. With this step the concept of subject citizenship which characterizes the territorial nation state of modern Europe was reached.

There is, however, another important root of the modern idea of citizenship and of the concept of naturalization consonant with it. The city-states of the later Middle Ages became in the course of their development the refuge for the free worker. Naturalization grew out of membership in a guild which carried with it the obligation to defend the town against any hostile acts of the feudal lords ruling the surrounding territory under the more or less nominal overlordship of a distant emperor or king. The German words *Burg* (fortified place) and *Bürger* indicate clearly the originally military significance of becoming a citizen. The provisions for acquiring citizenship varied greatly from city to city, as they were intimately bound up with the development of the various constitutions; but everywhere within the Holy Roman Empire the city emerged as the realm of freedom. This opportunity to become a member of a free citizenry was a most important factor in the growth of mediaeval cities and serves to explain centuries of extensive migrations in this direction.

Many of these independent cities were gradually destroyed with the rise of modern territorial states, like Austria, Bavaria and Prussia, which in the process naturalized their citizens; that is, transformed them into subjects of the respective princes. On the other hand, the United Netherlands, the Swiss Federation and the free cities of Frankfort, Hamburg, Bremen and Lübeck carried the mediaeval city tradition into the nineteenth century, despite the fact that their forms of government had become more or less oligarchical. Their readiness to naturalize any man who cherished their ideals and was willing to earn his living made these political communities important places of refuge. The predisposition of these communities to facilitate the acquisition of citizenship and the economic

advantages to be gained from the presence of skilled craftsmen combined to make the monarchs of the continental territorial states rather liberal in granting *Staatsangehörigkeit* (nationality). And when eventually the city-state ideal of civil liberty was molded by Rousseau into a philosophy which swept over Europe, the claim to naturalization acquired almost the position of a natural right of man. Indeed the use of the expression "rights of man" implies that every man has a fundamental right to be treated as an equal in the community to which he wishes to belong, provided he is prepared to support it with his life and his property. In the English speaking world this change was hastened by the rise of the United States, whose early history was characterized by a vigorous departure from the established English tradition. In England, as well as in France and Spain, the monarchs had been able to centralize feudal homage and fealty, the vassals becoming subjects of the crown bound by a common allegiance.

As early as 1295 there was in England a grant of the king's grace, whereby one Elyas Daubeny, who had been born in alien territory, became an Englishman; from that time on there followed isolated instances of these letters patent or of special acts of Parliament. In a great many cases the king made the reservation in his grant that the grantee should pay customs in the manner of aliens. The acts of Parliament, on the other hand, were usually unconditional. In the latter part of Elizabeth's reign a distinction developed between denization and naturalization. Thereafter a denizen was an alien who had obtained *ex donatione regis* a letter patent making him an English subject. His status was midway between that of an alien and that of a natural born subject: he could acquire land but could not inherit. By naturalization, which required a grant by Parliament, an alien was given the same status as a man born in the king's ligeance, until by an act of William III (12-13 Will. III, c. 2, sect. 3) he was barred from certain specified high political offices, notably membership in Parliament. The parliamentary act of naturalization had to be preceded by a religious ceremony: no person could be naturalized unless he had received the sacrament of the Lord's Supper within a month before the bringing in of the bill (7 James I, c. 2), and he must also take the oaths of allegiance and supremacy. Comparatively few, however, were granted the favor of naturalization. It was used ordinarily to attract traders, merchants and craftsmen or to reward loyal

foreigners; from the point of view of the recipient the removal of the property disabilities was an obvious advantage. In France the power to naturalize was exercised largely by the king alone, save for registration by the *Chambre des Comptes*; and when letters of naturalization were granted, as, for example, to alien tapestry makers in Flanders, the reasons were more or less similar to those which prevailed in England.

In the American colonies, where land was the chief form of wealth, naturalization and the property rights it conferred became important issues. The earliest provisions for naturalization, which were indicated in the colonial charters, were that aliens could be naturalized in England before emigrating to the colonies. Such a method could prove satisfactory only in a limited number of cases. When the governor of New York asked the crown for a general naturalization act for colonial settlers, he was expressing the colonial need for stimulating immigration. Naturalization as a right acquired by residence was desired by the colonies, but Parliament for a long time defeated efforts to pass a general bill along these lines. Accordingly the colonial governors or the legislatures arrogated to themselves the power to naturalize aliens. At first the governors made grants by letters patent. Later legislative acts became the prevailing method. Naturalization by a colonial act was recognized only in the particular colony where it was granted and thus conferred only local citizenship. A general act, however, was finally passed by Parliament in 1740; it provided that all foreign Protestants and Jews, after residing seven years in any of the American colonies, without absences of more than two months at a time, could upon taking the oaths or in some cases upon making the declaration of fidelity become British subjects (13 Geo. II, c. 7). This act was supplemented by the statute of 1747 (20 Geo. II, c. 44) and of 1761 (2 Geo. III, c. 25). As soon as independence was achieved and a constitutional government organized, there was still less limitation; in fact the act of 1790 marks the transition from naturalization sparingly bestowed by grace to citizenship granted as a matter of right and from special grants to general laws stipulating only the conditions of acquisition. It set up a uniform law of naturalization granting to all free white aliens who had resided within the jurisdiction of the United States for two years the right to claim citizenship under specified conditions, including notably an oath of "allegiance" to the constitution.

With this act the United States came to occupy a position similar to that of the city-states during the Middle Ages. The period of residence required for naturalization was lengthened to five years in 1795 and to fourteen years in 1798; it was reduced to five years in 1802. Persons of African descent were admitted to naturalization by a law of 1870. The spirit of the United States naturalization acts spread to the British dominions and to South America. In some Spanish American republics, such as Venezuela, it even reached the extreme of forcing naturalization—an extension of the principle of Spanish constitutional law that all domiciled aliens were Spaniards. From the colonial sphere the idea of naturalization conceived of in terms of a right spread throughout Europe. Nevertheless, it was rarely recognized as a right in the formal sense. Even republican Germany, for example, granted such formal right only to former Germans and alien combatants (*Kriegsteilnehmer*). Many European countries, such as France and Germany, went farther than the United States, however, in removing all political restrictions upon naturalized citizens: even the presidency of these republics is open to a naturalized person. The different point of view of these countries is perhaps best illustrated by the fact that some of them, like Germany and Austria, provide for automatic naturalization of persons appointed to public service positions. This provision is important mainly in the case of the Catholic clergy and professors.

The procedure followed in naturalizing aliens varies greatly from state to state. Wherever general laws establish a right of the alien to be naturalized, its exercise involves proceedings essentially judicial in nature. Only a dozen nations, however, including the United States, vest the power to conduct these proceedings in the judicial branch of the government; that is, in the courts of general jurisdiction. Some countries, such as Belgium, have left this power to the legislature. France, Germany, Italy and Spain are among those which have entrusted it to the executive, particularly to the minister of the interior; but here the development of administrative law provides for a judicial check against injustices.

Almost equally diverse are the legal requirements for naturalization. The requisite period of residence varies from one year to ten, with an average of about five years. In the United States the more recent tendency to restrict immigration and thereby the possibilities of estab-

lishing legal residence operates in fact as a restriction upon naturalization and has resulted in an increasing severity of legal requirements for naturalization. The same tendency appears elsewhere; for example, in the British dominions and in Switzerland. The problems created by the special needs of colonial governments within the British Empire were in part settled by the law of 1847 which allowed the colonies to create a citizenship effective only within their own boundaries. Since the present status of British nationality in international law recognizes only one common category of citizenship for the empire, a naturalized subject of the crown will be acknowledged as such only if he has been naturalized according to the British "type" act, the British Nationality and Status of Aliens Act of 1914, which together with its amendments has been accepted in most of the dominions. Immigration legislation in the dominions, however, introduces by implication additional requirements. It has been argued that similar requirements will have to be set up by all other European nations in order to ward off the threatened invasion of Asiatic races not readily absorbed into the European tradition. Whatever the force of this argument, the social and economic factors behind immigration restrictions have undoubtedly tended to resuscitate the older idea that naturalization is an act of grace or at any rate a right created only by legislative enactment which can easily be revoked. Questions inquiring into the "fitness" of a person to be a citizen have acquired a new significance. The United States has by law denied the right of naturalization to the Chinese, and by judicial interpretation to the Japanese, as well as to persons believing in anarchism or polygamy irrespective of their actions. In *United States v. Schwimmer* [279 U. S. 644 (1929)] the Supreme Court of the United States held that where there is doubt on any essential matter of fact with reference to the conditions of citizenship the government is entitled to the benefit of that doubt. In certain European countries discriminatory laws against Jews have been advocated. Under these laws Jews could not be naturalized and they might even be deprived of their status as citizens.

Along with the growing restrictions upon naturalization everywhere there is a tendency, particularly in France and the United States, to expatriate naturalized citizens under certain conditions. During the World War naturalized Frenchmen of German and Austrian origin were

expatriated, or rather their naturalization was withdrawn (laws of April 7, 1915, and June 18, 1917). After the war it was further provided that naturalized Frenchmen committing certain treasonable acts should suffer loss of French citizenship (law of August 10, 1927). Expatriation had formerly been troublesome in connection with naturalization because governments refused for military reasons to recognize naturalization of their former citizens. These difficulties were gradually eliminated by the Bancroft treaties of 1868 and later treaties following their model. The United States and Prussia, for example, reciprocally recognized naturalization after five years' domicile; and if the naturalized citizen returned to the country of his origin, he was liable only for breaches of law which occurred during the period prior to emigration. The progress made along these lines has been halted by the Fascist government, which claims military service from its citizens whether or not they have been naturalized elsewhere. The Bancroft treaties presumably have lapsed; they would now be relatively unimportant since Germany no longer has compulsory military service.

In most European states women become naturalized automatically upon marrying a citizen, a procedure which results in involuntary expatriation. This form of naturalization prevailed until recently in the United States, but at present here as in Soviet Russia such acquisition of citizenship is no longer permitted. Thus an alien woman who marries an American becomes stateless; a lesser inconvenience is the dual citizenship which an American woman acquires upon marriage to an alien, for this cannot involve serious complications so long as women are not liable for military service.

No discussion of naturalization as of other concepts of public law would be complete without brief reference to the extraordinary regulations for naturalization in the Union of Soviet Socialist Republics. In its constitution (July 10, 1918: ch. v, sect. 20) provision is made for almost automatic naturalization of all aliens, provided they belong to the working class. This is elaborated in an ordinance of 1924, which authorizes the provincial and regional executive committees as well as the central executive committee to confer upon such aliens the rights of Russian citizenship without any formalities. This unrestrained liberality is characteristic of revolutionary bodies: it existed in the mediaeval city-states at the time when they challenged the feudal order, in the American colonies and in

France after 1789. Revolution is expansive; it welcomes anyone who embraces its conceptions of life and government.

NAUMANN, FRIEDRICH (1860-1919), German political leader and social reformer. Naumann, the son of a Saxon clergyman, devoted himself to the study of theology. Under the influence of the social ideas of Wichern he entered the service of the home mission. For a time a follower of Adolph Stöcker, Naumann later became, however, the leader of the younger and more democratic elements in the movement. In 1896, as a result of differences with Stöcker, he organized the Nationalsozialer Verein. In the following year he retired from the ministry and as publicist and speaker worked for the reconciliation of proletarian socialism and German nationalism. When his organization failed to rally the masses, Naumann entered the ranks of political liberalism, seeking to establish active cooperation among all the liberal political factions.

With but a brief interruption in 1912-13 Naumann was a member of the Reichstag from 1907 until his death. During the World War he stirred up considerable discussion by his advocacy of the idea of Mitteleuropa. Anticipating that the outcome of the war would be unfavorable for Germany, he wanted to see the project of a united continental Europe assured for the future. After the war Naumann participated actively in the drafting of the Weimar constitution. He was concerned above all with the legal safeguarding of the rights of the church and gave the decisive impulse to the incorporation into the constitution of the "fundamental rights and duties." Shortly before his death he was elected leader of the Democratic party.

It was Naumann's historical achievement that he supplied a social content to middle class liberalism. At the same time he was the protagonist of the democratization of Germany, which, with the increase of the industrial population, appeared to him to be the prerequisite for a vital national spirit. He took his point of departure from Lutheran conservatism and he remained faithful to the religious principle even in his political activity; but by virtue of his serious preoccupation with Marxism he was receptive to new forms of social and spiritual life. His economic ideas were conditioned by the significance he attached to the growth of population; this emphasis led him to attack the tying up of large landed estates and to advocate land settlements, industrial education and social insurance. In opposition to revolutionary socialism he set forth a program of economic and political evolution based on a national adjustment of

social tension in the spirit of liberal and democratic responsibility.

NAVAL BASES. *See* NAVY.

NAVIGATION LAWS. *See* ACTS OF TRADE; BRITISH.

NAVY. Navies have existed since man first learned the art of navigation. As soon as it was found possible to use the seas as a means of transport or communication the idea of sea power was born. Sea power involves the ability to control the seas or any part of them and to deny their use to an enemy, whether that enemy is a belligerent neighboring state, a pirate or a marauder. Navalism exists today for much the same reason that it existed in the days of the Phoenicians, the Carthaginians and the ancient Greeks. A tribe, city-state or nation without means of defense at sea was exposed to the attacks of marauders in search of loot and slaves. If the community carried on trade by sea— and oversea trade is of as ancient origin as overland trade—its ships and goods were liable to capture by pirates or hostile neighbors capable of exercising sea power. Conversely, the state exercising sea power could carry its troops in ships by water for purposes of invasion and could cut off the trade of a weaker state or community. A small community, weak in numbers and natural resources, was able by developing sea power to become rich and powerful.

The outstanding naval power of the early Mediterranean civilizations was the Phoenicians. These great traders monopolized the commerce of the middle seas, searching for wealth, particularly metals, wherever their galleys could penetrate. They carried the jewelry, cloth and pottery of Egypt to barter for the tin and lead of Cornwall and loaded into their ships the gold and ivory of the west coast of Africa. Their trading posts grew into colonies, such as Carthage, which in their turn became, through the

development of superior sea power, more powerful than the mother country.

The Athenians, confined in a narrow valley, surrounded by powerful neighbors, were able to exist, grow strong and found flourishing colonies solely because of the strength and efficiency of their fleet of galleys. The city of Athens was strongly fortified and connected with its port of Piræus by a road flanked with walls on each side. The Acropolis and communicating walls were so high and strong as to be impregnable against the field armies of the time. So long as the galley fleet in Piræus was sufficiently powerful, trade could be carried on and the citizens fed, even though enemies were drawn up outside the walls.

In Rome a navy was necessitated by the growth of the state. As the Roman Empire spread, navalism sprang up in response to two needs—conquest and defense of trade. Egypt, Palestine, north Africa, England herself, all were brought under the Roman sway. These countries could be conquered only through an ability to control the seas and therefore to transport soldiers. A navy had to be maintained to guard the line of communications by sea and to ward off the attacks of pirates. As the population of Italy increased and at the same time the production of foodstuffs decreased, because of less intensive methods of agriculture and the enrolment in the armies of an increasingly large number of free Romans whose places were taken by inefficient slave labor, it became necessary to import foodstuffs, principally grain, from more suitable and fertile and less thickly populated countries. At the height of its power Rome drew most of its grain from north Africa and the region beyond the Jordan in Asia Minor. A large portion of the tribute paid in gold was transported by sea and had to be guarded. Although the Roman Empire was founded on military power and was overthrown when the land ravaging barbarians made their incursions from the north and the east, nevertheless its navy was of great importance; for without it the population of Italy could not have been fed. At a later date Venice, mistress of the Adriatic, and Genoa, mistress of the western Mediterranean, maintained their colonies, trade, wealth and military prestige primarily through the development of their navalism and sea power. The power controlling the Mediterranean Sea, with its interior lines of communication by water, continued, until the commercial revolution of the sixteenth and seventeenth centuries, to con-

trol the world. Similarly the Hanseatic League of north Germany grew rich and powerful through the exercise of sea power and the protection of its trading ships.

With the decay of the city-states dependent upon sea power—and only those relying on this power became important—the maritime nation states took their place as the successful exponents of navalism. Portugal, Holland and Elizabethan England were comparatively weak states until they entered upon a program of vigorous naval expansion. The Portuguese built up an empire in the East around a few trading posts, such as Macao in China and Goa in India, and were in turn supplanted by the Dutch, who founded a permanent Asiatic empire. So also England in the seventeenth century founded colonies on the mainland of North America which have grown into the United States, more wealthy and powerful than the mother country. In Elizabethan times and later sea power meant to Great Britain trade, colonies and defense against invasion; in the Napoleonic wars it meant the possibility of conveying troops to the desired theaters of war and a guaranty against invasion by sea. But with the progress of the industrial revolution Great Britain became more dependent than ever on its navy for the safeguarding of its very means of life. As industries were developed, cheap food became a necessity in order that wages and other production costs might be kept down. This necessitated the abandonment of protective tariffs for agriculture and the decay of the farming industries. Until the third decade of the nineteenth century Great Britain could have lost its oversea trade and its colonies and the consequence would have been merely impoverishment, for its population could still have been self-supporting from the soil. But after the industrial revolution, with the attendant increase in population and decay of farming, the diminution in Great Britain's trade and the loss of the colonies would have meant not only impoverishment but starvation. Today Great Britain could be starved in two months if its oversea supplies of foodstuffs were cut off. Similarly, its industries would be ruined if deprived of their supplies of such raw materials as wool, cotton, wood pulp and oil. Just as Rome drew its grain at the height of its power from north Africa and Asia Minor, so Great Britain today draws its foodstuffs from the Argentine, the United States, Canada and Australia.

Other nations, however, such as Turkey in the fourteenth and fifteenth centuries, Spain in

the sixteenth, France in the seventeenth and Germany in the nineteenth century, had already attained positions of power before they developed navalism. By the sixteenth century the Turkish naval power had been developed to such a point that the whole of Christendom was threatened, but the Osmanli Empire had been founded first on military land power and only later embarked upon a program of navalism. Here, as in the case of Spain in the same century, the motive was partly religious, the desire to conquer the world for the glory of Islam; and the attempt nearly succeeded, being thwarted only by the combination of the navies of the Christian powers. When Spanish sailors began their navigation and conquest of the New World, Spain was already powerful and to a large extent self-sufficient. The Spanish conquistadores fought and won control of South and Central America partly for loot and partly to spread the Catholic religion. The immense wealth in silver and gold brought from the new lands not only enriched Spain but percolated through Europe and, by expanding the currency in circulation, led to a great increase in trade and industry. But Spain was not dependent on oversea supplies of food nor on oversea markets to absorb the products of its industries. Its principal industry was war and its chief trade consisted in the export of governors, fighting men and priests and the import of gold, silver and other riches.

By the middle of the seventeenth century the balance of naval power had shifted to the northern European nations; and France, witnessing the rapid strides of England and Holland, sought under Louis XIV and later, somewhat unrealistically and disastrously, under Napoleon to develop its navalism as an adjunct of its land forces in order to dominate foreign markets. India in the East, Canada in the West, were the objectives. Similarly, the twentieth century saw the rise of the German navy, also developed as an adjunct of military power. This more modern type of navalism had for its object the development of oversea trade and a colonial empire. The evolution of modern international finance needed sea power to support it, both for the collection of debts and for the carrying through of such enterprises as the Bagdad Railway and its extension to the Persian Gulf, thus opening the way to India. When the German navy was destroyed, all hope of regaining its colonies, except by the good graces of its victors, vanished, as did likewise its predominating eco-

nomie position in Turkey with the valuable mining, mineral and oil concessions that went with it.

An even more modern type of navalism is to be found at the present day in the United States. The American demand for parity with England typifies the present day form of navalism. In the present state of the world a strong navy is a necessity for the United States, partly because it is a great creditor nation, partly because it must have influence in the councils of the world, partly because it has an important foreign trade and, lastly, because it has certain oversea possessions or protectorates, for example, the Philippines, for which it is responsible.

Modern navalism does not exist solely for the protection of sea borne commerce actually afloat. If Japan succeeds in winning a dominating position in China, as it has in Manchuria, it could, in the absence of an American navy strong enough to challenge it, stop all the trade of American manufacturers in the Chinese markets by arranging for the imposition of discriminatory duties and tariffs. But for the American navy nineteenth century European powers, notably Germany, might have attained a similar position of dominance in South America, in defiance of the Monroe Doctrine, and might have closed the doors to American merchants. The most modern development of navalism therefore is as a weapon of diplomacy, a lever to keep open the doors of trade.

Sea power through the ages, and especially in later centuries, has not only been a weapon for waging war, but by clearing the oceans of pirates it has enabled trade to develop and has thereby promoted cultural contacts and the exchange of ideas. It has also made possible the opening up and development of the American continents and Australasia and their settlement by men of European race. Russia could colonize overland through Siberia to the Pacific; the Moors could spread southward from the Mediterranean into tropical Africa without sea power; the invasions of India began with the Aryan migration; the settlement of the great peninsula by the Hindus was accomplished without sea power. But it was not possible for men of European race to settle in and develop North, Central and South America, south Africa and Australasia without navalism.

The slave trade was checked by sea power. Police duties are still carried on against pirates in many parts of the world, notably the China Sea, by men of war of the powers affected, just

as over a century ago American frigates quashed piracy and slave raiding on the African shores of the Mediterranean. Navalism plays its part also in succoring the victims of earthquakes and similar upheavals of nature, in charting the seas and in other peaceful and useful activities.

Although there has been considerable change in the motives of navalism, naval strategy itself has altered little. The strategy of the Trojan War differed little from the strategy of the Allies attacking the same straits of the Dardanelles in the World War. The real cause of the Trojan War was not the attempt to recapture the fair Helen. Achilles led the fleet and army of the Greek maritime states in federation to free the Hellespont from the strangle hold of their Trojan kinsmen, for the Trojans levied a heavy toll on shipping passing to and from the Levant and the Euxine, or Black, Sea. The Greeks fought for the freedom of the seas. The Allies attacking the German-Turkish land forces at the same Dardanelles sought to free a passage in order to establish communications with the south Russians. The strategy was the same, although the weapons and tactics had altered profoundly.

Naval tactics are the methods of handling fleets or single ships in battle. They altered little during the long galley period. There were minor modifications, such as the use by the Romans of special boarding bridges so that their superior infantry would prevail over the Carthaginian seamen once the opposing galleys had got to grips; but innovations such as boarding, ramming, the use of various types of artillery, from the large catapults of the Greeks and Romans to the cannon of the Turks and Venetians, had little effect on the basic tactics of the galley navies. The galley fleets propelled by their rowers could be manoeuvred as freely as a modern squadron of dreadnoughts or cruisers. The greatest although by no means the earliest sea battle of ancient times was that of Salamis in 480 B.C., when the Greeks under Themistocles with 366 triremes and some smaller vessels caught and defeated the Persian fleet of Xerxes in the narrow straits in such a position that the Persians could not deploy their enormous force of 1200 triremes and 3000 smaller vessels.

The galley was preeminently a Mediterranean war vessel and the sails were only an auxiliary to the oars. The first great change in naval development came with the improvements in seamanship and navigation introduced by the Norsemen, Danes and Normans. Their longboats were so constructed that they could under-

take lengthy voyages under sail, the oars being used in battle but the sails providing the chief motive power. The swift sailing galleys of the Moors represented a similar, though later, development. Singly or in small squadrons the Norse or Moorish raiders accomplished tremendous voyages, sometimes for trade, sometimes for love of adventure and exploration, often for loot and slaves. Thus the Norwegian longboats crossed the Atlantic to Newfoundland, penetrated far down the coast of Africa and sailed through the Mediterranean and into the Black Sea. Both the Norwegian and Moorish raiders relied on surprise, the sudden descent on a defenseless coast; they did not fight sea actions if they could help it. It was to resist them that castles and fortified towns were constructed near the coasts in all parts of the then known world. But as always throughout naval history this form of passive defense was found to be ineffective; and as a defense against these raiders on their own element, where it was most effective, the mediaeval navies were constructed.

The British navy was founded by Alfred the Great in order to meet the marauders before they reached the shores of his realm or to pursue and destroy them after they had raided his territory. The great enemy of Alfred and his successors was the Danish sea pirates. The Saxon king Egbert had at his disposal 5000 galleys—the largest propelled by 60 oars—which were divided into three fleets for the defense of all the coasts of England. These northern European galleys and longboats were smaller and swifter than the Mediterranean galleys and were not fitted with beaks, or rams, as were the Roman and Greek war vessels; the principal tactic employed was boarding. Although seamanship had progressed, naval tactics and weapons had actually deteriorated since the fall of the Roman Empire; and the first mention of the use of artillery on board ship was in the English fleet of Edward III.

The first great change in naval practise and warfare since the beginning of the art of navigation was brought about in the sixteenth century by the improvement in the sailing ship. The Dutch, English and French led the way in building and rigging ships so that they could undertake the longest voyages, keep the seas for almost indefinite periods and, most important of all, thanks to the newly developed art of tacking, sail against the prevailing wind. Prior to this the boldest navigators had had to rely either on small sailing ships, with oars or sweeps as auxil-

iary means of locomotion and of such a size that they could in emergency be dragged ashore; or else on large rowing galleys, which were themselves fair weather craft. The new model sailing ships of the sixteenth and succeeding centuries could be built large enough and strong enough to go anywhere. The great trade routes were opened up; the migrations to the New World commenced; the sea route to India became more certain and convenient for merchandise than the old overland caravan routes, thus transforming the trading economics of the Old World. Great as were the changes brought about by the new model sailing ship in peaceful spheres, they were even greater in methods of warfare and in strategy.

The large sailing ship was a more powerful war vessel than the rowing galley. It was stouter and heavier and carried a more powerful armament of cannon. The galley was forced to mount its cannon in the bow and stern only. The sailing warship carried its guns on the broadside in three and even four tiers. The largest Venetian or Genoese galley carried four heavy guns in the bow and two or three in the stern. The sailing battleship mounted up to 140 guns. Moreover it could keep the seas in all weathers and for an indefinite period.

The balance of sea power shifted at once. It was the north European states, along with Portugal and Spain, which now became the predominant maritime states, taking the place of Turkey, Venice and Genoa. The greatest benefit from this change and development in the art of navigation accrued to England. In time it overthrew the naval might of its rivals, Spain, Holland and France; the vast colonies, dependencies and dominions in the New and Old Worlds which comprise the British Empire today were won by the successful exercise of sea power, based on the new model sailing ship. And this type of vessel changed little in essentials of construction and rig from the Elizabethan era until the middle of the nineteenth century. When the next great invention in navigation was made, the marine steam engine, the English, having learned the lesson of sea power, profited by it. The English mercantile marine, using steam cargo vessels, developed a great trade; and the English navy was transformed from a fleet of sailing to one of steam vessels. The change was gradual and in the teeth of Admiralty conservatism. But the tradition of seamanship remained, and on it was built the new navalism,

The use of iron and later of steel for the construction of the hulls of warships was the next revolutionary change in naval architecture. The sailing frigate with an auxiliary steam engine, protected by iron plating on the side of the hull near the water line, represented a transition type of warship. The obsolescence of this type was demonstrated to the world in the famous action in the American Civil War between the *Merrimac*, a hybrid armored frigate, and the *Monitor*, the first war vessel constructed on the principles of the present day superdreadnoughts and embodying all the advantages of the marine steam engine, steel hull, heavy guns and armored turrets. The defeat of the *Merrimac* had a profound effect not only on American history but on the navies of the world. The modern fleets of the principal naval powers, with their superdreadnought battleships, fast cruisers and destroyers, are in the direct line of descent from the original *Monitor*. They are larger, faster, more seaworthy, more powerfully armed; but the modern warship is of the same type or nature as the seventy-year old invention of Ericsson.

From the point of view of equipment and man power the evolution of navies may be divided into three distinct epochs. First came the rowing galleys devised for the special conditions obtaining in the Mediterranean during ancient and mediaeval times. The galley fleets depended upon slave power. Next came the ocean going sailing ships, whose efficiency depended upon seamanship, the heritage of free men. The sailing navies were perfected by the descendants of those superb seamen, the northern European marauders, pirates and explorers. The third, and present, naval epoch is based on engineering and metallurgical skill. The efficiency of the modern navy depends partly on seamanship, it is true; but also on the skill of scientists—marine engineers, naval architects, chemists. In other words, only an industrialized nation with great engineering resources, material and human, can maintain a modern fleet for the exercise of sea power.

As regards naval strategy and the broader problems of sea power the chief lessons of the World War were the menace of the torpedo and the effectiveness of the submarine. Engagements between surface ships tended, in deference to the torpedo, to be fought at longer range, but otherwise they did not differ significantly from engagements between similar, if less powerful, types in the Spanish-American and the Russo-Japanese wars. The airplane had not reached a

point of development where it could assume the major role, which in the light of the steady progress it has made in the post-war period seems its unmistakable destiny in future naval strategy. The submarine, on the other hand, thanks to its power of evasion and concealment, introduced significant changes in the basic character, if not the immediate tactics, of naval warfare. If threatened with superior forces it could dive and escape. It was able to make extended voyages totally submerged and thus to appear where least expected. It is preeminently the weapon of the weaker power, offsetting the advantages of number and material. While it is difficult for submarines to cooperate with the surface ships in battle—partly because of their slow speed when submerged and partly because of the difficulty of distinguishing friend from foe if placed in tactical positions and submerged beforehand—they have enabled the weaker power without command of the sea to attack enemy ships and thereby frustrate an effective blockade. For to be effective a blockade must be complete; commerce must be prevented from entering or leaving any of the ports of the enemy. The most effective form is that known as the close blockade. Here naval forces, usually consisting of cruisers, are stationed so near the blockaded ports as to be practically certain of interrupting merchant vessels attempting to enter or leave. The cruisers are backed up by battleships, so as to overawe the enemy warships from attempting to raise the blockade. This entails long periods at sea, cruising at slow speed to economize in fuel. Such blockading vessels are an easy target for submarines. An example in the World War was the sinking of three armored cruisers, the *Cressy*, *Hogue* and *Aboukir*, by a single German submarine while they were on slow patrol for blockade purposes in the southern part of the North Sea. The close blockade had to be abandoned in the World War because of this menace of the submarine. The distant blockade took its place. This form depends upon the coercion or acquiescence of the neutrals. With half the world at war, as in 1914-18, neutral rights may be flouted—as they were. Nevertheless, grave friction was caused between Great Britain and the United States through the distant blockade of Germany.

If the submarine has made the task of the would be blockader difficult, so has it complicated the task of the commerce defender. Before the invention of the submarine the power with command of the sea could round up its enemy's

cruisers and effectually guarantee its own sea borne commerce from all attacks, except on the part of sporadic raiders. Now, because of its powers of evasion, the submarine can operate on the trade routes in the face of overwhelming power in surface ships. The stronger power, to counter the submarine, must either undertake the hazardous operation of hemming in the enemy ports and bases with mines or other obstructions or submit to the inconvenience of herding its merchant shipping into heavily guarded convoys. For submarines are capable of very long voyages and can appear in distant seas—in the World War German submarines laid mines off Cape Town and operating from Bremen and Kiel attacked merchant ships off the Río de la Plata—and they can dodge enemy surface patrols and trade guarding cruisers.

It would seem incontestable therefore that the submarine and its weapon the torpedo have weakened sea power as exercised by a stronger fleet. The torpedo itself, whether launched from submarines, destroyers or airplanes, is a serious menace to the very large warship. In consequence a school of thought among naval students decries the value of the very large warship. And this school is growing in numbers and influence. Why, it is argued, build vessels costing \$45,000,000 each when they may be disabled by one well aimed torpedo fired from a comparatively miniature vessel costing \$500,000 or from an airplane costing at most \$200,000?

Although France is the only one of the great powers to draw the full conclusions of this type of reasoning, the status of the different types of war vessels has materially altered, even in the United States, Great Britain and Japan. Before the perfection of the torpedo and the development of small vessels to carry and launch it, the great ship of the line was supreme. Only another vessel of similar type could hope to engage the large capital ship with any hope of success. But now the most powerful fleet of dreadnoughts afloat fears the night attack by torpedo armed destroyers or the day attack by torpedo armed airplanes or submarines. The torpedo indeed has democratized naval warfare as the invention of gunpowder democratized land warfare. Something more than mere weight of metal and efficient seamanship is required for the effective exercise of sea power. A combination of seamanship, airmanship and scientific skill will determine the fate of nations, if battle is ever again joined between first class powers.

The navies of antiquity were national in the modern sense of the word; that is, they were state navies owing allegiance to the tyrant, the princeps or the republic. After the downfall of the Roman Empire the navies were administered on a feudal basis, corresponding to the feudal system prevailing throughout most of Europe. The great fleets of Christendom gathered for the crusades were provided by the feudal nobles. One reason for the success of the Turkish marine at the height of the Ottoman power was that the fleet was national and therefore more homogeneous. As state organization gradually replaced feudalism, the navies became national again; but territorial fleets survived, as, for example, the ships provided by the Hanseatic League and those furnished by the Cinque Ports in the south of England to the Tudor and Stuart fleets. The lord high admiral of England had the duty of gathering and commanding the feudal warships, provided partly by the nobles, partly by certain ports of the realm. His office corresponded to that of the marshal of France, who commanded the feudal armies. This office survives in Britain today, although it has been in commission for three centuries. The lords of the Admiralty are still appointed by royal warrant on the recommendation of the prime minister to exercise the functions of the lord high admiral. The first lord is a member of the cabinet and has been of civilian status for the last seventy years.

In France and Italy the navy is administered by a Ministry of Marine, the head of which, whether a sailor or a civilian, is a member of the cabinet. In the United States the navy is administered by the Navy Department, the secretary of which is always a civilian and always a member of the cabinet. The American constitution provides for complete and absolute civilian control of the navy, and the service is completely subordinated to the political executive. The Japanese navy, built upon the antithetical principle of military control, is under the command, theoretically, of the emperor; and its professional head, always a member of one of the great feudal clans, has direct access at all times to the emperor. The minister of marine in Japan is not bound by cabinet responsibility and can, as in the case of the naval action at Shanghai in 1932, follow an independent policy.

The British system is halfway between the two. The king is commander in chief of the Royal Navy; but his cabinet, as a whole, is responsible for its upkeep, efficiency and em-

ployment. Nevertheless, the Admiralty in London has a status different from that of any other department of state, with the possible exception of the Foreign Office. The only real control of the Admiralty by Parliament is the right to withhold supplies of money—a right which could be exercised today only at the cost of overthrowing the government and precipitating a general election. In all matters of administration the Admiralty is supreme. And, with the British public's innate sense of dependence upon sea power, the position of the Admiralty is immensely strong. The professional members of the board, the sea lords, five in number out of eight, have the right to resign. A threat of resignation by the sea lords on three occasions during the present century has led to the surrender of the cabinet of the day. Nor is there a statutory or constitutional committee of Parliament exercising control over the Admiralty, as in the American Senate and House of Representatives and as in the French Senate and Chamber of Deputies. By comparison the positions as well as the influence of the War Office and Air Ministry in England are weak. Without an annual act of Parliament a standing army and air force cannot be maintained at all.

A modern fleet is costly, despite the varied attempts since 1918 to limit expenditure by international agreement. With the growth of taxation in the industrialized countries difficulty has been experienced in most large states in obtaining the necessary appropriations. This has led to an objectionable development of propaganda, aided and abetted by the armament firms, shipbuilders and armor plate manufacturers. The kaiser of Germany and his Ministry of Marine carried on a campaign to educate the German public to the desirability of a strong fleet and the need of paying for it. This agitation in its turn alarmed the French and English and was one of the underlying causes of the World War. After the war agitation was begun in the United States for shipbuilding as against the British and Japanese navies and in Great Britain and Japan as against the American navy. The French public was frightened about the Italian fleet and the Italians about the French navy in the Mediterranean.

The only fleets whose crews are voluntarily recruited today are the American, British and German, the last named because of the Treaty of Versailles, which forbids conscription in Germany. In order to attract recruits the rates of pay have to be higher in the voluntary navies

and more attention must be paid to living conditions on board ship—a fact which must be borne in mind when making comparisons of national expenditures. All the other navies are recruited by conscription, usually from the maritime populations. Service varies from two to four years, which is too short for the maximum efficiency but which has the advantage of building up a large reserve. In all the conscript navies a proportion of the crews are highly trained, well paid volunteers serving on long engagements. Naval reserves are an important element in the manning of a fleet and for this reason the nations with large mercantile marines and flourishing deep sea fishing populations are at an advantage.

The attempt of the predominant naval power to use its strength for the coercion or threatened coercion of the land powers has led to endless controversy. During the past three centuries the British, wielding the most powerful sea weapon, have claimed the right to intercept and seize the merchandise of an enemy on the high seas. The claim has been opposed by the doctrine of the freedom of the seas, espoused at various times by France, Germany, Russia, the northern neutrals in the Napoleonic wars and above all by the United States. The issue led to strained relations between Britain and the United States at the beginning of the World War because of the operations of the Royal Navy against neutral ships carrying articles useful for the armies of the Central Powers. But the doctrine led to war between Germany and the United States when the submarines of the Reich torpedoed neutral merchantmen, including American traders, for the "offense" of being at sea at all.

In the Fourteen Points of Woodrow Wilson, on the strength of which the German armies laid down their weapons, the freedom of the seas was incorporated to serve as a basis for future international maritime law. Blockades were not to be imposed in the future except by international action for the enforcement of international covenants. Great Britain and its allies made reservations at the time of the Armistice against this, the second of the Fourteen Points, and in the discussions at the Peace Conference succeeded in defeating the doctrine for the time being. Public opinion in Britain was stated to be unripe for the change, and Lloyd George threatened that he would be forced to resign if the point were pressed, warning that no British statesman could be found to espouse the doc-

trine. The controversy has continued, mostly behind the scenes at disarmament conferences, ever since; but no solution has been found. The British Admiralty clings to the weapon of blockade in any future "private war"; and there are signs that the American Department of the Navy, now that parity of strength with Britain has been agreed to, is beginning in its turn to weaken on the doctrine of freedom of the seas.

The World War profoundly altered the balance of power at sea. The destruction of the German fleet raised the American navy to the second position. The heavy American programs of naval construction during the war and afterwards, together with the losses sustained in action by the British fleet, threatened the material supremacy of the once proud "mistress of the seas." France, having neglected her navy during the long struggle in order to concentrate on arming her soldiers, dropped into the fourth position, being displaced by the Japanese. There is incipient rivalry between the French and Italians for the fourth place in order of strength. Parity with Italy was accepted by France at the 1921 Washington Naval Conference. Since then the French fleet has been strengthened and the Italian demand for parity was strongly opposed by the French delegates at the 1930 Naval Conference in London.

At the Washington conference the principle of parity between the British and American navies was accepted for the heavy ships of the line, that is, the battleships and battle cruisers; and an agreed ratio for the Japanese strength in heavy ships was drawn up. No agreement, except on tonnage and the caliber of guns, could be reached with regard to cruisers, destroyers or submarines. This omission was made good at the London Naval Conference in 1931, parity in all classes as between the American and British fleets being accepted, with an agreed ratio for Japan. No agreement could be reached as between France and Italy. The Japanese, however, are now demanding the right to build up to parity with the Anglo-Saxon powers.

It should be noted that the parity agreed upon at the London Naval Conference is to be achieved by the United States building up to the strength of the existing British fleet, at a cost of \$1,000,000,000. This conference for "disarmament" has led to an actual increase in naval shipbuilding. As yet no new agreement for naval disarmament or limitation has been arrived at by the World Conference at Geneva. Only five navies can today be reckoned as being in the

first rank—the British, American, Japanese, French and Italian, in order of strength. The German navy is strictly limited under the Treaty of Versailles, with certain prohibited items, such as submarines, aircraft carriers and naval airplanes. Under Chancellor Hitler Germany in 1933 strenuously demanded the removal of these prohibitions and limitations. The accompanying table of relative strength is from the official figures of February 1, 1933.

Dockyards, arsenals, fueling stations and fortified harbors of refuge are of the greatest importance to a fleet. The sailing navies could do without bases to a far greater extent than their modern successors. Wooden ships could have their bottoms cleaned by careening and their crews could make all but the heaviest repairs on hulls and rigging. Wind was the motive power, provisions lasted for many months and the necessary fresh water could be replenished from any stream. But a modern fleet needs dockyards for repairs, with dry docks, either of the graving or floating type, for making good damage under water and cleaning the bottoms; fueling stations not too far from the possible theaters of war or cruising stations; and harbors of refuge where ships may lie secure from submarine and air attacks. A naval base must possess one of the above features and should possess two or three of them. Boston in Massachusetts, Plymouth in England, Brest in France, are examples of national dockyards with all the facilities for repairs, docking and refueling and well fortified against any form of attack.

Naval bases can be improvised from any suitable landlocked harbor, as was demonstrated

during the World War. The Rosyth dockyard on the Firth of Forth on the east coast of Scotland was unfinished. The existing dockyards, Chatham, Portsmouth and Plymouth, had been developed on the south coast during earlier wars with the Spaniards, Dutch and French. The Grand Fleet commenced the war without any suitable base prepared on the east coast facing the Helgoland Bight. Scapa Flow, a spacious, semi-enclosed area of water among the Orkney Islands off the north of Scotland, was used at first. But it was found that the enemy submarines had a larger radius of action than had been foreseen and the fleet took refuge in the sheltered Lough Swilly in the north of Ireland. Scapa Flow was hastily defended and prepared, and the Grand Fleet utilized it until in its turn the Firth of Forth was ready and safe against submarine attack.

Great Britain has, on the other hand, paid great attention to the question of oversea naval bases. Several of its colonies were established solely for this purpose, for example, the island of Perim, Bermuda and the Falkland Islands. After several attempts, as at Tangier and Minorca, a secure base, now converted into a first class dockyard, was obtained for its Mediterranean fleet at Malta. Holding Gibraltar in the west, Malta in the center and the Suez Canal ports in the east, Britain dominates the Mediterranean. Aden and Perim at the entrance to the Red Sea secure the Suez Canal route to India, and the Royal Navy is well served with bases on the Cape of Good Hope route to Asia. The increase in Japanese naval strength and the non-renewal of the Anglo-Japanese alliance

have dictated the policy of expanding Singapore, on the strategically important Strait of Malacca, from a fueling and cruiser base with a small dock into a first class fortified dockyard and arsenal, although some strategists doubt the wisdom of the Singapore policy by reason of the fact that bases open to land attack have proved themselves dangerous. The Port Arthur base for the Russian fleet during the Russo-Japanese War is an example; the German base at Tsingtao, on the mainland of Shantung, wisely abandoned by Admiral Graf von Spee's squadron before its investment by the Japanese, is another.

The United States navy is not well served with oversea bases outside the Pacific Ocean. In this area, however, are Manila and the other harbors in the Philippines, Pearl Harbor, Guam and Honolulu. Naval considerations have undoubtedly influenced American policy toward the Philippines. Similarly Irish home rule would have been granted earlier by Britain but for fears as to the uses to which the magnificent harbors of Ireland, flanking Britain's most important trade routes, might be put in some future war. The lack of oversea bases influenced American naval policy in the direction of demanding large cruisers with a wide radius of action when England proposed a further limitation of size. It has likewise encouraged American seamen to cling to the battleship type of warship as being less vulnerable and therefore less dependent on dockyards for repairs and at the same time has led to the development of the "train" of repairing vessels, ammunition ships, fleet oil carriers, hospital ships and the like, with which any suitable harbor can be improvised as an advanced base.

NEALE, EDWARD VANSITTART (1810-92), British cooperator. Neale, whose father was a rector and a scion of the landowning aristocracy, was a lawyer by profession. His study of the utopian socialists influenced his aims but not his methods; in 1850 he joined the Maurice group of Christian Socialists and became the outstanding exponent of cooperation. Neale inaugurated the first cooperative stores in London, in 1869 founded the Cooperative Union, of which he became secretary, and helped to establish the Cooperative Wholesale Society in 1863, the Cooperative Insurance Society in 1867, the Cooperative Newspaper Society in 1871 and the International Cooperative Alliance in 1892. He was also instrumental in obtaining the legislation whereby cooperative societies acquired a legal status, and trained other cooperative leaders in the basic principles of voluntary association. Al-

though his interests were more practical than theoretical, Neale's literary contributions were of great importance and still merit close study; he wrote frequently for the *Christian Socialist*, the *Cooperator* and the *Cooperative News*.

While Neale was a pioneer in consumers' co-operation, he was primarily an advocate of cooperative workshops, which he considered complementary to combinations of consumers in effective social reconstruction. He insisted that employees be granted a share in the profits and direction of cooperative enterprises. A Tory in politics, Neale preached socialism "with a difference"; the alternative to state socialism and communism is voluntary cooperation, which aims, he said, "not to relieve the poor but to remove the causes of their poverty."

NEANDER, AUGUST (1789-1850), German church historian. Neander, born David Mendel of Jewish parents, was converted to Christianity in 1806. As professor of church history at the University of Berlin from 1813 to his death he exerted an enormous influence upon German intellectual life and in particular upon the development of studies of church history. His work bears the stamp of the romantic movement; like Chateaubriand in France he stimulated a renewed interest in religion, while lacking, however, the dilettantism, aestheticism or genius of the French romanticist. Neander's ideas contributed greatly toward undermining the influence of the rationalist church history of David Friedrich Strauss and the Tübingen school. Inspired by Schleiermacher and the Pietists, especially Spener and A. H. Francke, he pleaded for a treatment of ecclesiastical history which should be sympathetic and based on a feeling of inner piety. His work therefore often reveals a lyrical monotony. In his emphasis on the "sublime

certainly beyond reflection" he anticipated the more modern views of Bergson and William James; he likewise prepared the ground for the revival of interest in Pascal. In the manner of Ranke, Neander looked upon the various epochs and forms of the Christian church as revelations of the divine spirit. History for him represented individuality, and he sought in the history of the Christian church the "freedom and manifoldness of Christianity." Since Christianity in the process of its development was constrained to adapt itself to the "course of human affairs" and since the institutional aspects of the church reflected the conditions of secular society, he considered the individual phases and forms of Christianity as only so many "ideas of God."

NEAR EASTERN PROBLEM. The near eastern problem had its origin in the decline and dissolution of the Ottoman Empire, which set in with the treaty of Kuchuk Kainarji between Turkey and Russia in 1774. According to its terms Russia arrogated to itself the right to protect the Orthodox Christian population in Turkey, which developed into the right to interfere in Turkey's internal policy. But it was not alone the desire to protect Orthodox Christians which made Russia Turkey's paramount enemy from 1774 till 1917. Historical, mythical, strategic and

economic motives combined to push Russia toward Constantinople, the possession of which would mean the realization of the historical mission of Russia as the true heir to the Byzantine Empire. At the same time domination of the Straits would give Russia access to the Mediterranean, open the Black Sea, upon which the trade routes of the rich provinces of southern Russia depended for free world traffic, and bring the country as a whole out of its seclusion into broad communication with Europe and the East.

Russia's designs, however, met with the powerful opposition of the British Empire. Constantinople guarded the ancient trade routes from Europe to southern Asia; the discovery of the sea route to India had diverted world trade from these ancient routes and had led to the decline of the Near East and the Mediterranean countries. It was Napoleon who recognized the importance of the land way to India, for by reopening this passage he might have dealt a death blow to the growing Indian Empire and British domination of the seas. But Napoleon's success in this direction was limited to drawing the attention of the world, especially of Great Britain, to the land road to India across the Near East. Once the French were eliminated, Great Britain determined not to allow any other power to dominate or endanger this route and by a policy of foresightedness and persistence acquired control of the two maritime approaches from the Near East to India. By the occupation of Aden, the islands of Perim and Sokotra in the south and later of Egypt with the Sinai peninsula in the north, England came to dominate the Red Sea, while it monopolized the Persian Gulf by imposing a British protectorate upon the Arab chiefs of the gulf coast and by strengthening British political and economic influence at Basra, the entrance port of Mesopotamia, and at Mohammerah and Bushire, the principal Persian ports in the south. By the 1840's England had conceived the bold scheme of tracing the road from the Mediterranean to the Persian Gulf. The all British railway from a Syrian port, presumably the Bay of Acre, to the Euphrates has since remained one of the chief designs of British imperial policy, especially following Disraeli's inauguration of the era of conscious imperialism by the coronation of Queen Victoria as empress of India in 1877. In 1882 the Suez Canal was brought under British control and the western approach through the Near East to India was now safe for England.

The eastern approach to India, however,

seemed to be threatened by the steady march of Russian conquest in central Asia and in the Caucasus in the nineteenth century. Advancing relentlessly through the Balkans to Constantinople and the eastern Mediterranean, through the Caucasus to Armenia and Mesopotamia and through central Asia to Persia and Afghanistan, Russia's progress was a threat to British India and an even greater menace to the existence of Turkey and Persia. Great Britain, on the other hand, was interested in the maintenance of Turkey and Persia as buffer states between the Indian Empire and Russia and preferred to see the road to India in the hands of a weak nation like Turkey or Persia rather than in the control of a strong European power. British policy, which was responsible for supporting Turkey and Persia despite their weakness, disorganization and corruption, was aided in turn by the mutual jealousy of the European powers, which could not reconcile their antagonisms and reach an agreement concerning the participation of the Ottoman Empire. France had great financial interests in Turkey—probably more than half the foreign capital invested in Turkey was French; the railroads, ports and public utilities of Turkey were built by French capitalists and the largest part of the Ottoman public debt was in the hands of French bondholders. But greater even than its financial interests were France's cultural interests. The educated classes of all creeds throughout the Near East had been brought up on French culture: French ideals and ideas influenced their intellectual outlook, and political and judicial reforms were modeled after the French pattern. Since the crusades France, as the protector of Catholic Christendom in the East, had a historical and sentimental interest in Syria, including Palestine. The traditions of St. Louis lived on in France and were nourished by the numerous French Catholic institutions in the Levant. The jealousies of the European powers thus kept the Sick Man of Europe alive without, however, permitting him to recover. Every movement for consolidation and reform was blocked, in Turkey as well as in Persia; but as long as the powers could not agree on partition, Turkey remained as a weight in the balance of power, a ready victim to be sacrificed when occasion should arise.

In the Balkan Peninsula the chief antagonists were Russia and Austria-Hungary. After Austria's expulsion from the German Confederation in 1866 the Dual Monarchy inaugurated a policy of expansion in the southeast, looking upon the

lower basin of the Danube as its natural outlet. On the other hand, Russia pushed toward Constantinople through the Balkans, whose populations were of the same creed and often kindred in race and language. Russian territorial ambitions were strengthened by the mystical Slavophile desire to "liberate" the Slavic peoples from the rule of infidel aliens. These international jealousies and rivalries were, at the beginning of the twentieth century, intensified by the emergence of two competitors—Italy and Germany. The former, with its growing population and rising nationalism, revived the traditions of imperial Rome and of mediæval Venice and Genoa, whereby the Adriatic Sea and its Balkan shores as well as the eastern basin of the Mediterranean with Morea, Cyprus and Rhodes had been looked upon as the domain of Italian influence and trade. Germany found in the undeveloped Near East a new outlet for its expanding industrialism. Germany's alliance with Austria pointed in the same direction. The kaiser romantically declared himself the friend and protector of the Turks and of all Moslems who wished to contribute to the economic and military development of Turkey. There was projected, as an expedient in binding the distant parts of the Ottoman Empire into a closer unity, a railway from Constantinople to Bagdad, which at the same time could become part of the new transcontinental trunk line, Berlin-Byzanz-Bagdad, pushing forward to the Persian Gulf and the Indian Ocean and opening up to German capital and enterprise districts potentially rich in oil. This scheme constituted a threat not only to British interests but also to Russian interests in Armenia and Kurdistan and to French interests in Syria and Cilicia. Thus on the eve of the World War all six European powers were probing the Near East; while Constantinople was seething with intrigues, hopes and despairs.

Behind this screen of diplomatic struggle were not only the imperialistic ambitions of the powers but also the national aspirations of the peoples of the Balkan Peninsula and of Asiatic Turkey. In the Balkans Greeks, Bulgarians, Serbs, Albanians, Rumanians and Wallachians; in Asiatic Turkey Greeks, Armenians, Kurds, Assyrians, Arabs, Maronites, Jews and Druses, lived under Turkish rule. Because of the loose, mediæval form of government in the Ottoman Empire, which did not consider all its inhabitants as equal Ottoman citizens but recognized every religious sect as a social and administrative unit of public law, called *millet*, all these peoples

were able to preserve their distinct ethnico-religious individuality. Each *millet* maintained its social and family relations according to its own law, administered and controlled its own schools and social institutions and had its own political chief and representative in the person of its religious head. The very broad autonomy of the *millet* was based not on territorial divisions but on personal allegiance to a church or creed. Since the character of the Ottoman Empire was a religious one based on Islam and Islamic law, the various Moslem races—Turks, Arabs, Albanians and Kurds—did not form any special *millet* but were the bearers of the empire, which was not racial or nationalistic in its formation but supraracial and religious in the sense of a very universalistic religion. For this reason the national awakening of the Moslem peoples came much later than that of the Christian races of the empire, which through the *millet* organization never lost the consciousness of their separate individuality.

The first nationalist movement in the Balkans developed among the Greeks. The unsuccessful rising of Alexander Ypsilanti in 1821 was the signal for the general rising in the Morea under the leadership of Greek clergymen and notable Greek brigands. In 1830 an independent Greek state was created and Serbia was made an autonomous province within the Ottoman Empire. In 1878 Serbia and Rumania became independent and Bulgaria attained an autonomous status. Finally, in 1908 Bulgaria proclaimed its independence. These national movements were preceded and accompanied by a literary renaissance in which the struggle against illiteracy and ignorance was joined with that for political freedom. In 1888, however, only 11 percent and in 1900 only 23.9 percent of the population in Bulgaria was literate and in 1910 only 17 percent of the population in Serbia was literate. Nevertheless, the Balkan states were well advanced in comparison with the Ottoman Empire, which under the rule of Abdul-Hamid II passed through a period of hostility to all forms of intellectual progress and westernization. In 1908 the despotic rule of Abdul-Hamid was overthrown by the Young Turks, who sought to launch a new era of reform and consolidation. But the nationalism of the Young Turks did not allow for a real consolidation of the multiracial empire; by a process of Turkification it provoked the rising nationalism even of the Moslem races of the empire—Arabs, Kurds and Albanians.

The acquisition of more or less racially homogeneous territories did not appease the nationalistic aspirations of the Balkan states. The Greeks dreamed of the restitution of the ancient Byzantine Empire with Constantinople as its capital and St. Sophia as its cathedral and of the "redemption" of the ancient Ionian colonies in Asia Minor and on the southern shore of the Black Sea. This "great idea" dominated all Greek political thought until 1922, when it was definitely routed by the Turkish victory. The Serbs, driven by their "great Serbian idea," looked toward the restoration of the Serb Empire, which under Stefan Dušan had united Macedonia with Serbia and Albania and had aimed at a union of Serbs, Bulgarians and Greeks. The Bulgarians, on the other hand, still remembered that their czar Ivan Asen II had once governed Albania, Macedonia, Epirus and Thrace from his capital at Trnovo. They had almost achieved their ambition by the peace of San Stefano (1878), which created a Bulgaria from the Danube to the Aegean and from the Black Sea to the river Drin in Albania, but the Congress of Berlin, which allowed only a much reduced Bulgaria, succeeded in blocking this union. Thus Macedonia, in which a predominantly Bulgarian population is mingled with Turks, Serbians, Greeks and partly Hellenized Wallachians, remained the goal of rival ambitions. The two Balkan Wars, one waged by a Balkan coalition against Turkey, the other by Greece and Serbia against Bulgaria, succeeded in reducing Turkish territories in the Balkans to a small strip of eastern Thrace, but they did not solve the Macedonian question; the Bulgarian population became subjected partly to Serbia, partly to Greece, whereas on the shores of the Adriatic the independent state of Albania was created. The World War, which had its immediate origin in the aspirations of Serbia to "liberate" the Serbians living in Austria-Hungary and in which Bulgaria fought on the side of Germany to regain Macedonia, ended with a further reduction of Bulgarian territory.

The post-war attempts to solve the Balkan problem have not led to satisfactory results. Traditions, ethnic considerations, economic interdependence, desires for access to the sea, still present a maze of conflicts. There are at the present time as many danger spots in the Balkans as there were in 1910 or in 1914, and the political unrest and financial chaos in Greece, Yugoslavia and Rumania are no less aggravated than they were in 1912. Although Austro-Hungarian and

Russian empires no longer exist, the jealousy between France and Italy has continued to intensify the rivalries between the Balkan states.

Serbia has at last acquired an outlet to the Adriatic, but this has served only to bring it into conflict with Italy's aspirations. Torn internally by the violent dissensions between the primitive Orthodox Serbians and the more westernized Catholic Croats, the newly created kingdom of Yugoslavia presents a united front only against Italy. Yugoslavia and Rumania are both under French military and financial control, while Albania, on the other hand, is practically an Italian protectorate. Bulgaria continues to look toward acquisition of the Macedonian territories which Serbia holds, but which are or have been until very recently inhabited largely by Bulgarians. Greece has appropriated Bulgaria's outlet to the Aegean Sea and by the influx of Greek refugees after 1922 has completely Hellenized districts which were predominantly Bulgarian and Turkish. Traditional rancors are constantly being revived by the political and economic oppression meted out by each ruling state to some of its minorities. Expulsion, forcible assimilation and annihilation of large minority groups have sharpened the antagonisms of the various ethnic groups. These conflicts, strengthened by the international rivalries of the great powers, have thus far prevented the formation of a Balkan federation which alone, by some compromise, could reconcile opposing racial claims and keep the Balkan states from becoming pawns in the game of international politics. As long, however, as extreme nationalism holds sway over the Balkans and as long as Bulgaria's complaints are not heeded there seems no likelihood that a Balkan confederation will be created and a peaceful settlement reached.

Turkey is the only Balkan state which emerged with increased strength from the chaos of the Balkan Wars and the World War. Although it has lost almost all its territory in Europe and all the Arab provinces of the Ottoman Empire in Asia, the near eastern problem, which is still acute for the Balkans and even more so for the Arab lands, is apparently definitely closed for Turkey. The Sick Man no longer exists, for the new Turkey has practically nothing in common with the Ottoman Empire. Casting aside all old rancors, Turkey has become the protagonist of a Balkan federation; on October 30, 1930, it concluded a pact of friendship with its former enemy Greece. A long and fateful chapter of world history, which the great powers sought to

continue by the Treaty of Sèvres concluded immediately after the World War, was forever closed by the Treaty of Lausanne in 1923. Whereas Germans, Hungarians, Bulgarians and Arabs have had to chafe under what they consider to be gross and unjust humiliations imposed upon them by the treaties of Paris, Turkey has been left free to devote itself entirely to a policy of internal reconstruction and peaceful relations with all its neighbors and former enemies.

The Treaty of Sèvres aimed at maintaining the two methods by which the powers had gained control of the Ottoman Empire and had stultified all projected reforms—financial and economic domination and “protection” of minorities. Concession hunting in the old Turkish Empire had developed into a scandalous scramble for political and financial advantages, abetted by the Capitulations and a tariff imposed upon oriental countries by the powers, which by a rigid and uniform *ad valorem* duty opened the markets to an overwhelming flood of European articles and which removed from local industry or agriculture all protection or encouragement. Only more recently did Turkey, Persia and Egypt regain their tariff autonomy, so that they could distinguish between necessary and luxury imports and stimulate national industry and agriculture. The Treaty of Lausanne has liberated Turkey from all financial and economic control. Turkey, followed shortly by Persia, broke the fetters of the Capitulations and inaugurated a campaign for the cultural and social improvement of the masses and for the modernization of the whole economic structure. The oriental countries, which had previously been the victims of a Europeanization imposed from without, now began to engage in a much more effective campaign for Europeanization from within.

The Treaty of Sèvres was an attempt to perpetuate the right of foreign powers to interfere in Turkish administration on behalf of minorities. Such intervention was used to hinder every move of the near eastern countries for consolidation and progress. The powers lavished promises upon Armenians, Kurds, Maronites, Zionists and Arabs. Arab unity and freedom, a Jewish state, an independent Armenia within its ancient frontiers—all these enticements were offered, although often in ambiguous terms allowing for later reinterpretation and adaptation. The Treaty of Lausanne put a definite end to hopes for an Armenian state or an autonomous

Kurdistan. The victorious Turks, allowed a free hand by the European powers, terminated the Armenian, Greek and Kurdish “questions” by the most primitive methods. The Treaty of Lausanne recognized the complete national independence of the Turks and their right to settle their minorities problems according to the doctrines of political sovereignty and patriotic nationalism. The minorities, which had placed their trust in the powers and had been led to an inflation of their nationalist hopes, now found themselves deserted and confronted by an adversary whom they had done their utmost to embitter.

In the years immediately following the World War British statesmen played with the idea of a middle eastern empire which would dominate all approaches from Europe to India and control the rich oil resources of the Caucasus, Kurdistan and Persia and the cotton areas of Egypt, Turkey and Iraq. The old rival, Russia, and the younger rival, Germany, seemed forever out of the way. British troops were in Constantinople, in the Caucasus, in Transcaspia, in northern and southern Persia, on both sides of the Suez Canal, in Bagdad and in Jerusalem. All roads to India which had been threatened by Russia and Germany were in British hands. In the Caucasus it was hoped with the help of native states to create a *cordon sanitaire* against the Bolshevik plague similar to that on the Baltic shores. But the new nationalist movements presented an unforeseen difficulty. The Anatolian Turks under Mustafa Kemal drove Great Britain's allies the Greeks out of Anatolia into the sea and by 1923 there were no British or other foreign soldiers in any part of Turkey. The Persian coup d'état (February 21, 1921) under Riza Khan, who later became shah of Persia, wiped out the Anglo-Persian treaty of August 9, 1919, which had established what was virtually a British protectorate over Persia. The rising of the Arabs of Iraq in 1920 led the British government to replace the mandate by a bilateral treaty which recognized the autonomy of Iraq and helped it in the true Wilsonian spirit to become entirely independent within twelve years. In Syria and Palestine repeated revolts of the native Arab population against the substitution of French or British colonial rule for Turkish domination forced the mandatory powers to modify their policy at least superficially. In Egypt the nationalist movement under the able leadership of Sa'd Zagh'lul was rewarded in 1922 by the British declaration of Egyptian independence.

Thus by the end of 1922 the political picture was entirely different from that of 1919. England's hope of a middle eastern empire was shattered, and it had definitely lost prestige in the Near East; but by a farsighted policy of conciliatory readjustment, especially in 1929 and 1930 in Iraq and Egypt, it was able to fortify its position.

The success of the national movements in Turkey, Persia and Afghanistan was stimulated to a great extent by the attitude of Soviet Russia, which while reviving the czarist policy against British influence in Asia, proved far more formidable than old Russia had been. In the pre-war period Turkey and Persia, although they considered both Great Britain and Russia as enemies, preferred liberal England to czarist Russia. Great Britain had brought with it to the East a message of freedom, of civilization, of democracy, although it did not live up to its own ideas and ideals. Now the Soviet government carried to the East, with its generous message of liberty and equality for all the oppressed colonial peoples, a genuine desire to adhere to these promises. In its treaties with Turkey, Persia and Afghanistan it proclaimed not only the complete independence, sovereignty and equality of these states but renounced all capitulations, concessions and privileges which czarist Russia had possessed. The new oriental states, supported by their pacts with the Soviet Union, were able to attain complete independence and equality.

Independent Turkey embarked on a policy of complete Europeanization and secularization, followed to a lesser degree and less consciously by the other near eastern states. Elementary and technical education were developed after 1922 in Turkey, Persia and Egypt. Students were sent to European universities to study science, engineering, education; the problem of illiteracy was attacked, sanitation was developed, agriculture was organized on a more rational basis, industries were created, machinery was introduced, communications were improved and religious domination gave way to a process of complete secularization. An economic, social and cultural order which had been rigid and unchanged for centuries was shaken by a new spirit and will to live.

The independent states of Turkey and Persia have maintained a policy of strict neutrality in their foreign affairs. Bound by friendship to the Soviet Union, the near and middle eastern states have been careful also to maintain cordial rela-

tions with all their neighbors and with the European powers. Under Soviet auspices treaties of friendship have been concluded between Turkey, Persia, Afghanistan and the Soviet Union, guaranteeing the independence of these states from external aggression and securing to them the possibility of economic, administrative and educational reform. The demilitarization of the Straits has put an end to this point of conflict.

While Turkey and Persia achieved their national aims after the World War, the Arabs remained dissatisfied. They had joined the Allies in the hope of attaining freedom and unity. After the war they remained disorganized, while some of the most fertile regions which they had considered their own were placed under foreign rule. The Treaty of Sèvres remained in force for the Arab portions of the former Ottoman Empire and the British and French mandatory administrations in Palestine and Syria preserved in an attenuated form the old Ottoman spirit in the territories entrusted to them. In Syria the French administration deprived the Moslem interior of its fertile access to the Mediterranean and created a state of Great Lebanon under the influence of the Catholic Maronites, who favored French rule and who by invoking French protection created a pretext for France to stay in Syria indefinitely as protector and mediator. Unlike Egypt, where the national movement bridged the gulf between the Moslems and the Copts, or Iraq, where a similar rapprochement was effected between Sunnites and Shiites, Syria under French administration became the scene of ever more bitter religious feuds and dissensions. In Palestine the Arabs found themselves just as deceived as were the Zionists, to whom Great Britain had promised help in the establishment of a Jewish national home. When the Jews arrived the small country was inhabited by 800,000 Arabs who themselves had but recently become race conscious and were longing for independence. The Zionists, who as a highly educated and gifted people have accomplished excellent results as colonizers and nation builders in Palestine, were confronted by the many arduous ethical, political and economic issues raised by the national awakening of the Arabs. Because of the bitter national struggle, in which both sides believe their national existence and development are at stake, Great Britain has been able to maintain, although Palestine is an A mandate, an autocratic colonial rule without any participation by the population in the ad-

ministration or legislation of the country. Palestine seems destined to become the chief British strategic point on the road to India. For the old importance of the Levant as the road from Europe to southern and eastern Asia has reappeared. The introduction into the deserts of Asia of new means of communication, the motor car and the airplane, has completely revolutionized all notions of time and space. Regularly the motor car crosses the Syrian desert from Damascus to Bagdad and the vast Arabian peninsula from the Red Sea to the Persian Gulf. Three points in the Near East, all under British control, have become important airplane junctions: Cairo, Palestine and Bagdad. The great Imperial Airways, the Asiatic from London via Bagdad to India and the African from London via Cairo to Cape Town, touching at Palestine. A British railway is to be built from Haifa to Bagdad and Basra and is perhaps to be continued to India; and Haifa is to be linked via the Suez Canal and Cairo to the projected British trans-African railway from Alexandria to the Cape of Good Hope. Palestine has contracted a loan guaranteed by England to construct with part of the money a modern port in Haifa which will become the great British maritime station in the eastern Mediterranean, protecting the entrance to the Suez Canal and forming the head point of the land and air route to India. Mosul oil is being conducted by pipe lines across the desert to Haifa to supply the British fleet. Thus the Asiatic Near East still retains its importance in world politics as one of the greatest roads of imperial intercourse. Great Britain is interested in protecting this road by extending the *pax britannica* to Arabia. On the other hand, the Arabs, led by two very able leaders—King ibn-Sa'ūd of Hejaz and Nejd, who has made of Wahhabi religious enthusiasm a corner stone of Arab nationalism, and King Faisal of Iraq, under whose guidance that country has entered the League of Nations as the first Arab state and has become the center of the aspirations for the union of Iraq, Syria and Palestine—still strive toward Arab unity, which they regard as the only guaranty of their independence and intellectual and material progress.

Two main problems in the Near East thus require solution in the not too distant future: the readjustment of national claims and conflicts in the Balkans and the reconciliation between Arab nationalism and British imperial interests. The former may be solved through a Balkan federation; while the second may well follow the

pattern of British negotiations with Egypt and Iraq. But here as everywhere the crucial need is the moderation of nationalism to the end that it may, by veering away from imperialism, come eventually to serve the interests of humanity.

NEBENIUS, KARL FRIEDRICH (1785-1857), German economist and administrator. Nebenius studied law and later served in the Baden ministry of finance as councilor and permanent secretary of the department. From 1838 to 1839 and again from 1845 to 1846 he was minister of the interior and from 1846 to 1849 president of the Baden privy council. He played a most decisive role in framing the constitution and in reforming the fiscal system of Baden. He attained distinction in economic literature with his *Der öffentliche Kredit* (Karlsruhe 1820; pt. i, 2nd ed. 1829), hailed by Roscher as the best economic monograph in German; in this work Nebenius analyzed the economic and social effects of public indebtedness and concluded that a large public debt is undesirable since it

accentuates the inequality of distribution of wealth, fosters the rise of a rentier class and in general has a retarding effect upon the course of production. While he criticized some of the teachings of Smith and Say, particularly by pointing out the multiplicity of factors involved in the shaping of economic events and by stressing the role of demand in the process of price determination, in general economic theory Nebenius remained essentially a follower of the classical school. In economic policy, however, probably because of his intimate contact with concrete economic needs of his country, he rejected the conclusions of economic liberalism and became one of the outstanding champions of the Zollverein.

NECKER, JACQUES (1732-1804), French minister of finance. Necker, who was born in Geneva, came of Germanic stock. After elementary schooling in Switzerland he was sent to Paris to complete his studies in banking. For twelve years he served as an employee in the Vernet bank and in 1762 he and the bankers Thellusson took over the institution, which became one of the most important in Paris. He was soon introduced into official circles and in 1769 gained reputé upon his publication of a reply to Morellet on the Compagnie des Indes. In 1772, after successful negotiations designed to help the royal Treasury, he retired from business. The next year Necker published an *Éloge de Jean Baptiste Colbert* (Paris 1773), which attracted considerable attention; it was a defense of the celebrated minister, followed by notes in which he affirmed his neomercantilist faith in opposition to the reigning physiocratic doctrine. In 1775 his work *Sur la législation et le commerce*

des grains (Paris 1775, English translation London 1776) stated his position as clearly hostile to the free export of grain advocated by the physiocrats. It echoed Galiani and won wide acclaim, despite the decisive replies made to it by Morellet and Baudeau.

For some years Necker had represented the Republic of Geneva at the French court; in 1776 he was called to the post of director general of the royal Treasury, although he was a foreigner and a Protestant, and in the following year was made director general of finance. The title of minister was refused him as was admission to the Council of State, but in fact he directed the financial operations of the government until his first retirement in 1781. In his famous *Compte rendu présenté au roi* (Paris 1781) he left the not very brilliant balance sheet of his administration as well as a much too reassuring account of the innumerable difficulties which were besetting the government. His only important innovation was the establishment of provincial administrations in the various regions of France.

In 1784, during his retirement at Lausanne, he published his chief work, *De l'administration des finances de la France* (3 vols., Paris 1784; tr. by T. Mortimer, London 1785), which is still consulted today and in which he gives a primarily historical account of taxation, interspersed with observations on the grain trade, provincial assemblies, luxury and the like. He was recalled to power by public favor in 1788 with admission to the Council and dismissed on July 11, 1789, and it was his departure which provoked the uprising of July 14. Upon being recalled once more he saw his popularity decrease, and he handed in his resignation in September, 1790. He continued to work upon various essays, collected after his death in the fifteen-volume *Oeuvres complètes*, edited by the Baron de Staël (Paris 1820).

NEGLIGENCE. In modern law liability for negligence, or fault, is more common in the civil than in the criminal law. The liability for criminal negligence has already been treated under intent (*see* INTENT, CRIMINAL). In early systems of law, however, little if any distinction is traceable between civil and criminal liability: the two

forms of liability may be described as a viscous intermixture.

In the Roman law, as stated by Justinian, *dolus*, or intentional damage, was opposed to *culpa*, or unintentional damage. *Culpa* originally signified active conduct and was contrasted with *negligentia*, or negligent omission, the opposite of which was *diligentia*. Three degrees of *culpa* were recognized: *culpa levis*, or failure to exercise that degree of care which a *bonus pater familias* (a careful, circumspect, sound man of business) would use; *culpa levis in concreto* (the epithet *in concreto* is due to the moderns), or failure to show such care as a person would ordinarily use in his own affairs; *culpa lata*, or failure to show any reasonable care—lack of that degree of care "which any fool would take"—reckoned as equivalent to *dolus*. The first and third standards of care were therefore defined objectively, but the second was a subjective conception. The principles upon which these degrees of care were based in contractual and quasi-contractual liability are not clear. A rough test was that where a party benefited by a transaction he was liable for *culpa levis* and that where he did not benefit he was liable only for *dolus* and *culpa lata*; but there are puzzling exceptions and still greater difficulties with respect to liability for *culpa levis in concreto*. As regards delict the rule was much simpler. The typical delict involving *culpa* was unlawful damage, *damnum injuria*, under the *Lex aquilia*, and *culpa levis* was sufficient to raise liability. Contributory negligence of the aggrieved person was a defense if it was the true cause of the injury. There was no liability for mere omission. In contrast with modern Anglo-American law *culpa* was not itself an independent delict. For *casus*, or inevitable accident, no one was liable in delict or, in the absence of express agreement, in contract. Roman law recognized vicarious responsibility for so-called "quasi-delict"; for example, a shipowner, an innkeeper or a public stable keeper was liable for the theft or damage of his employees, and in "noxal liability" the owner of a slave had the option of handing over to the injured party the slave who had committed a delict or of paying damages. Otherwise an employer was not liable for the delicts of his servants unless he was *in culpa* himself.

Early Germanic law exhibits a very strict principle of liability. The person who injured another was in general civilly liable to compensate the other party merely on that ground, and quite irrespective of whether he committed the

act intentionally or negligently and of whether the obligation which had been broken was based on contract or on tort. Inattentiveness was not distinguished from intent. Even pure accident was not invariably a defense. Thus the property of irresponsible people, like lunatics and children, was amenable for injuries done by them, although their persons were free from liability. The theory was that as a man takes all his happiness whether deserved or undeserved from the environment of his individual life, so he must accept all misfortune, deserved or undeserved, due to that environment ("intrinsic accident"); and this was the reason also for vicarious responsibility of the house lord, the slave owner and the employer of labor for the wrongs of his dependents. But that environment marked the limit of a man's liability. For "extrinsic accident," or misfortune not associated with his individual environment, he was not responsible. In effect this exemption did not extend beyond sickness, imprisonment, service under the king and self-defense, although in the law of bailment somewhat wider exceptions from liability were admitted. Early French law had similar rough rules of justice—"The act judges the man, questions of intention are not examined." Mere negligence might lessen the composition payable for a crime, but it did not release the wrongdoer from payment of damages.

The reception of Roman law greatly modified the old rules of strict liability in Germanic law. There was a penetration of the refined idea of *culpa* with its threefold division (but *culpa levis* has been dropped in the current German code); the old distinction between external and internal accident disappeared, although it has survived in current German law with respect to railway carriers, innkeepers and the post office; and the Roman principle was adopted that nobody was liable for inevitable accident. In the law of tort the reception led also to a modification of liability, for there was no responsibility for mere omission under the *Lex aquilia*; local regional systems, however, often followed the ancient strict rules.

In England Anglo-Saxon law was as primitive as continental law. It is inaccurately said that "a man acted at his peril," but in fact there were many modifications of liability, although it was unquestionably strict in general. At any rate no distinction in civil liability was drawn between intent and negligence—it was true, however, that the less a man was in fault, the less would he have to pay—and for wrongs of mere omis-

sion there appears to have been scarcely any liability in private law. There is very little trace of liability for tortious negligence in the king's courts after the Norman Conquest, but possibly this gap was partially filled by the local courts. From the fourteenth century, however, the law of tort developed. Liability for trespass, or direct injury to person or property, was strict until comparatively modern times. There were, however, many exceptions; the most familiar were self-defense, necessity and perhaps the act of God. Inevitable accident as a ground of exemption can scarcely be said to have been completely recognized until the nineteenth century.

The origin of liability for negligence must be sought in the action of trespass upon the case or in the action upon the case. Very early instances of such liability are those of the innkeeper and the common carrier because they exercised a "common calling"; by the sixteenth century anyone who professed skill in his business was responsible for incompetence in its discharge. Other examples of liability for mere omission were very rare. It was difficult enough for the law to attempt to prevent positive wrongdoing. There was an exception in that a man was liable if he allowed the escape of such dangerous things as fire or cattle. Toward the end of the eighteenth century there was a steady tendency to isolate negligence as an independent tort, and after the first quarter of the nineteenth century this isolation was developed rapidly. The progress of invention in industrial machinery in general and of railways in particular was responsible for this trend, for they greatly increased the frequency of negligent accidents. Negligence in the law of tort thus acquired and still possesses a twofold meaning. First, it retains its old signification of inadvertence to legal duty, which is a possible mental element in some torts; thus it is possible to commit defamation either intentionally or negligently. Secondly, it signifies a separate tort, which consists in the breach of a legal duty to advert to the circumstances or the consequences (or both) of an act or omission which causes damage to another. The standard of this legal duty is that of a "reasonable" man, so far as advertence to the circumstances of the act or omission is concerned, and that of directness with respect to the chain of causation which connects the act or omission with the consequences. Whether a legal duty to take care exists or not is a question of law for the determination of the court in each case. A "reasonable" man is an abstract conception of what an ordinarily

careful person would do or refrain from doing in circumstances which are the same as those under consideration. A very common defense to an action for negligence is contributory negligence on the part of the plaintiff. But even this will not prevent the latter from recovering damages unless such contributory negligence is the decisive cause of the injury; the rules for determining whether a cause is decisive or not are intricate. Where it is decisive the defendant escapes all liability. As to vicarious responsibility for negligence the rule is the same as for other torts; an employer is liable for all negligence committed by his employees in the course of their employment.

Such are the main principles of the English common law with respect to the negligence in the law of tort. Broadly, American case law, despite divergence as to some particular situations, may be said to be similar. In the common law of both systems negligence in the performance of a contract is no more an excuse than is intentional breach. In the law of bailment the threefold division of *culpa* in Roman law still exists in theory, but in practice the tendency is to amalgamate this division under the one standard of "reasonable care in the circumstances."

On the continent the French *Code civil*, which has considerably influenced the law of many other countries, creates liability for *faute*. This may be defined as an act or (subject to certain qualifications) an omission effected without right against the right of another. The right violated may be contractual, delictal or quasi-delictal. By a verbal distinction of no practical importance *délit* includes intentional *faute* and *quasi-délit* includes *faute* due to imprudence or negligence. Theoretically there is no difference between contractual and delictal *faute*, but in practice there are at least two solid distinctions. In contract the creditor need not prove *faute*; the burden of proving inevitable accident is on the debtor. In delict the plaintiff must prove, where proof is necessary, *faute* on the part of the defendant. Again, in contract the debtor is liable only for foreseen and direct damages, while the author of delictal *faute* may be liable for unforeseen damages. Contributory negligence, provided that it is the exclusive cause of the damage, is a complete defense to all kinds of civil liability; but where it is not the exclusive cause, responsibility for the damage is shared by the parties in proportion to the gravity of their respective negligence. Finally, *faute* is presumed in the case of damage done by animals or

inanimate objects, but for damage done by the defendant personally it must be proved. In general *cas fortuit* (inevitable accident; *force majeure* is practically the same thing) is a defense to civil liability.

In the current German Civil Code *Vorsatz* is distinguished from *Fahrlässigkeit*. *Vorsatz* means that a person acts or refrains from acting with the knowledge that his conduct will have or may have certain consequences. It is not exactly the same as intention. Nor is *Fahrlässigkeit* adequately translated by "negligence," for it means the omission to take that degree of care which it was the defendant's duty to take in "ordinary intercourse." As a rule the test is *diligentia boni patris familias*, which has come to mean liability not for *culpa levis*—this has been dropped by the present civil code—but only for *culpa levis in concreto*; but everything depends on circumstances. Thus, if a man professes any special qualifications, he is liable if he does not possess them. Gross negligence is not defined and is treated as a question of fact in each case. The German and the English law of negligence are basically the same, but the German test of diligence is more objective than is the English test of reasonableness; and strict liability, or liability irrespective of intention or negligence, is common in German law. The law as to contributory negligence is much like that in England; but there is a notable difference in that, even if the plaintiff's contributory negligence is the decisive cause of the damage, this does not in German law necessarily deprive him of his remedy. It is left to judicial discretion to determine whether the defendant's liability to compensate is totally destroyed or merely reduced.

The modern tendency in both the Anglo-American and the continental systems is to broaden civil liability. Social, scientific and economic developments of the last century have made this inevitable in any body of law which professes to keep in reasonable touch with the needs of the community. There is a marked trend in favor of creating responsibility for nervous shock and other non-corporal injury. Moreover the age is one of machinery and of corporate undertakings and trade, and the hidden dangers of machinery and the weakened sense of responsibility inherent in the impersonality of a corporation have broadened the law in two directions. First, the scope of liability for negligence has been enlarged by the constant action of the courts in inferring a duty to take

care in circumstances which could never have been presented in the older law. Secondly, both the courts and the legislatures have created strict liability in many instances, where it is useless for the defendant to prove that he was not negligent. He is not (as is loosely said) absolutely liable, however, for he is not in general responsible for the act of God or the unlawful act of a third party.

A conspicuous example of this strict liability in the Anglo-American law of tort is responsibility for the escape from land of dangerous things. This doctrine, which was laid down in England in 1868 in the celebrated case of *Rylands v. Fletcher* (L. R. 3 H. L. 330), was at first rejected by American courts but has now been recognized by some of them. Again, in American law and (since 1932) in English law a manufacturer of chattels which he knows or ought to know are dangerous may be liable for injury to an ultimate subpurchaser with whom he has no contract. Further, English statutes have set up strict liability with respect to private aircraft and to damage done by dogs to cattle. The Maritime Conventions Act, 1911, recognized with respect to collision of ships a rule of contributory negligence more like that prevailing in the continental systems and probably more equitable than the general English rule. It provided that in such collisions where both parties have been negligent each must bear a fair proportion of the loss.

On the continent there has been since 1890 a heated controversy among French lawyers as to the existence of responsibility without fault. Those of the older school, relying on the bare words of the *Code civil*, deny that there is any foundation for the doctrine. Their opponents urge that the true principle is that the courts have nothing to do with investigating any mental element in an injurious act and are concerned only with the causal connection of the act with the damage. Probably the better view is that this latter principle does not extend beyond undertakings creating extraordinary risks, such as the great industries and the activities of the state in declaring war, administering justice and controlling the police.

Modern German law exhibits instances of strict liability in making persons in charge of railways or other similar public works responsible for death or bodily injury except where the accident is due to *vis major* or contributory negligence. The burden of proving these defenses is on the defendant. The German Auto-

mobile Law of 1909 puts owners and drivers of motor vehicles in much the same position.

NEGOTIABLE INSTRUMENTS are documents representing legal claims which are regarded in law as transferable and which give to a purchaser in the ordinary course of business a good title even though that of the seller may have been defective. The idea of negotiability thus represents a departure from the older legal traditions of the common law of England and of the Roman law in at least three respects; for such traditions pay little heed to unsealed writing, they are averse to assignability of

choses in action, and they deny the possibility of the seller's transferring a better title than he has. In this departure from legal tradition there can be seen a triumph of the business demand for security in regular transactions even at the cost of insecurity in vested rights and defenses.

Elements of negotiability are discernible in most systems of law. Accordingly the Babylonians, Egyptians, Greeks and Romans in the ancient world and the Arabians, Jews and Italians, particularly in the cities of northern Italy, in the mediaeval world have been looked upon by various writers either as the inventors or as the bearers or the revivers of the idea. In England negotiability is first encountered as an importation by foreign merchants from the continent of Europe—a part of the law merchant. Its applicability was limited strictly to foreign bills of exchange; that is, orders drawn on a merchant in one country to pay the money of that country to the holder, in exchange for his foreign money which he had paid or was to pay to a correspondent of the merchant in that foreign country. The documents were intended for one purpose only: to facilitate money changing and incidentally the transfer of money credits from country to country, in days when the shipment of gold and silver was attended by great dangers and considerable state intervention.

While the continental negotiable bill of exchange grew without departing radically from this early type, the same institution transplanted into English and American jurisprudence not only flourished more vigorously but gave rise to a variety of documents with altogether new functions. The expansion of the Anglo-American law of negotiable instruments can be traced by studying the classes to which it became applicable; the types of instruments included; their external form, which passed from indefinite custom to common law and eventually to codification; and, finally, their practical uses in business life. A survey of these developments will make possible an understanding of the present substantive law of the subject in England and America and the difficulties inherent in the task of making uniform once more the negotiable instruments law of the civilized world.

Until the opening of the seventeenth century the customs or laws of merchants were applied in England in merchants' courts. In 1622 Gerard de Malynes insisted that none but a trader could draw a bill. A "gentleman" could not. By the end of the century the plea that the alleged drawer was a gentleman was rejected as a de-

fense on actions on bills of exchange, which became commonplace in the royal courts. Behind this change there were several concurrent movements: the onslaught of the king's courts from the days of Lord Coke against all kinds of special jurisdictions and the decay of these jurisdictions especially during the Commonwealth; the transfer of trade from foreign hands into English hands and not infrequently into the control of gentlemen; the development of the idea of equality before the law; and, most important of all, the development out of *assumpsit* of a form of action for enforcing simple contracts.

The negotiable instruments thus recognized in English law were essentially our modern foreign bills of exchange, although it was still common to introduce four persons on the face of the bill instead of three as is done at present. These are described by Beawes (*Lex mercatoria rediviva*, London 1752) as the deliverer, drawer, acceptant and possessor (payee). The reduction to three was subsequently accomplished by various combinations; for example, of the deliverer and acceptor. The transaction was usually recited or alluded to by such a phrase as "value received"; but the defense of no consideration, even between the parties, could not be used (Bl. *Comm.* II, 446) until the crystallization of the English law of contracts at the end of the eighteenth century. English merchants began early to extend the customs pertaining to foreign bills both to inland bills and to promissory notes. After a series of altercations with Lord Holt the merchants of Lombard Street were victorious, for Parliament declared promissory notes to be negotiable. The practise of drawing checks, by legal definition "bills of exchange drawn on a bank payable on demand," originated in England in the seventeenth century, spread rapidly and came to be followed by all classes, especially in America. Banknotes payable to bearer have become the most familiar form of currency. Elaborate notes issued by corporations and public bodies have become the bonds of investment banking. Statutes have adapted the idea of negotiability to a greater or less degree to the law of other business instruments—bills of lading, warehouse receipts, stock certificates. It has been advocated for interim certificates and stock warrants, and in the meantime lawyers have taxed their ingenuity to incorporate the effect of negotiability by direct stipulation. The difficulty is that such stipulations are not binding, as are the corresponding rules of law, on those who have not assumed them by contract.

On the other hand, the likelihood of developing new types of negotiable instruments otherwise than by statute has dwindled, as the external form of the law has passed from that of custom provable as fact through that of custom standardized and cognizable in court to that of common law and codified statute. The names which stand out in the history of this development are those of Lord Mansfield, chief justice of the King's Bench from 1756 to 1788, who referred doubtful questions to a special jury of merchants and crystallized their verdicts into law; Justice Story, whose *Commentaries on the Law of Promissory Notes* (1845) and *Commentaries on the Law of Bills of Exchange* (1843) were accepted as classics on both sides of the Atlantic; and Sir Mackenzie D. Chalmers, who drafted the English Bills of Exchange Act (1882); the latter became the model for the act proposed by the Commissioners on Uniform State Laws in the United States in 1896, which was adopted not only in every jurisdiction in the United States but in Alaska, Porto Rico and the Philippine Islands. The commissioners have since proposed a few modifications calculated to remove doubts as to the applicability of the act to bonds and to some other instruments and to restore uniformity where the supervention of a generation of case law has once more created or revealed discrepancies.

What was originally a means for facilitating money changing and money transfer has thus become useful in many business situations: the negotiable instrument serves as a primary credit instrument and lends itself readily to the introduction of secondary liability of various degrees and on various contingencies; it shades off into an investment device, as in long term notes and bonds, both corporate and governmental; in the form of checks it becomes a substitute for money and the very essence of the present banking system; in the form of banknotes and treasury notes it serves as money; in the form of trade acceptances it tends to remold large sections of the whole credit system; and when the acceptance is surrendered from the document it gives rise to the letter of credit.

The substantive law of bills and notes did not survive all these modifications in form, applicability and tribunals without itself undergoing great changes. Indeed it is doubtful whether fourteenth century promises to merchants that their cases would be handled *secundum legem mercatoriam* (*Carta mercatoria*, 1303; Statute of the Staple, 1353) had reference to any sub-

stantive law at all. Such principles as existed were probably all procedural, and substantive rules were precipitated only very gradually. Before Mansfield's day special customs for London and other localities were recognized. Story described the implications of these documents dogmatically and at great length. He frowned on the suggestion that in the absence of statute there might be a peculiar New York law of negotiable instruments [Swift v. Tyson, 41 U. S. 1 (1842)]. Yet great divergences did develop in the states and, because of the ready passage of negotiable documents across state lines, soon caused considerable confusion. Dogmatic clarity was the very thing called for in the uniform law, and that is its outstanding attribute. The opening sections of the act describe the external indicia of negotiability, so that a document can be recognized as negotiable or non-negotiable on its face. The operative words are "order" or "bearer," and there must be no additional promises in the document, the purport of which must be an order or promise to pay a sum certain in money at a fixed or ascertainable future time. The processes by which an instrument may be negotiated are clearly set forth: the instrument payable to bearer or already endorsed in blank is negotiable by delivery; all others require endorsement. The effects of endorsement may be qualified and limited in various ways, but all true negotiations have one feature in common: they cut off "equities"; that is, they give the "holder in due course," i.e. the *bona fide* purchaser for value without notice who obtained the instrument before its maturity, a title freed from many of the defects to which it was subject in the hands of the previous owner. There are to be sure a few so-called real defenses, such as forgery, against which even the holder in due course cannot prevail. Two types of liability on an instrument are recognized: first, the unqualified liability of the persons primarily liable, namely, the maker of a note and the acceptor of a bill; and, second, the conditional liability of a drawer or endorser, which attaches only if the instrument has been dishonored by the person addressed or primarily liable and the customary steps have been taken to record that fact (protest) in the case of a foreign bill or a bill of another state and in all cases, if notice, except where waived, has been given to the person secondarily liable.

When efforts were made at the Hague International Conference on Bills of Exchange meeting in 1910 and 1912 and at the Geneva con-

ferences of 1930 and 1931 to unify the negotiable instruments laws of all countries, the chief difficulties which made it impossible for the Anglo-American representatives to come to terms with those of continental Europe were precisely those features of the law which have made its newer functions possible. Two great systems—the French and the German—prevail on the continent. The former is based on the *Ordonnance du commerce* of Colbert (1673) and serves in turn as the basis of the law of Greece, the Netherlands and Serbia. It has likewise been influential in Haiti, Santo Domingo, Argentina and Egypt. The German system is the result of an attempt made in the middle of the nineteenth century to render uniform the negotiable instruments laws of the fifty-six jurisdictions of Germany. It has served in turn as the basis of the law in Bulgaria, Hungary, Italy, the Scandinavian countries, Portugal and Russia and has been adopted in Japan, Peru, San Salvador and Venezuela. Combinations of the French and German systems exist in Belgium, Spain, Cuba, Porto Rico, Honduras and Malta and are exemplified in the drafts of the International Conference.

The outstanding characteristic of the French system is the fact that because of its early codification it has crystallized the law as represented in early English practise, and its content is similar to that administered by Lord Holt before the Statute of Anne (3, 4 Anne, c. 9, 1704). Thus for a long time there was insistence upon a *distantia loci* involving a crossing of state lines and a diversity of money systems. The document had to be closely related to a single concrete mercantile transaction. The idea of payability to bearer was resisted. Great stress was laid upon the necessity that the drawer make "provision" as the basis for his expectation that the drawee would honor the document. Endorsement was cumbersome, and the number of endorsements allowed was limited. The time within which a sight bill had to be presented was set for various places, depending upon distance, as from three months to one year, with a doubling of the permitted period for foreign bills in case of maritime war. Proceedings against drawers and endorsers had to be commenced soon after presentment or payment by a particular endorser, or the right of recourse was lost to such endorsers or drawers as had made "provision." There has been a tendency, both in practise and in legislation, to approach the English customs. Thus the consideration for the transaction need no longer be stated, and since

the law of 1922 a mere signature has been held sufficient endorsement. Promissory notes have been assimilated to bills of exchange in such matters as maturity, endorsement and the rights and duties of the holder. Checks were introduced late on the basis of English analogies but without ever being recognized as a variety of bill of exchange. Both can be drawn on persons other than banks. There is no provision for their acceptance or certification. As in England, they can be "crossed"; that is, so marked as to be not further negotiable to anyone other than a bank or agency for collection.

The German system of the *Wechselordnung* contrasts with the French in that it stresses the abstract nature of the negotiable instrument by divorcing the document from the transaction which gives rise to it. Bills payable to bearer or in blank are, it is true, not bills of exchange, but endorsement in blank results in the creation of bearer paper. Checks, which are treated separately, as in France, are generally made "payable to bearer," under the requirements of the banks. As in France, the right of recourse to persons secondarily liable is barred in very short periods, ranging from three to eighteen months, according to distance. The *Wechselordnung* requires that bills of exchange, notes and checks must contain words aptly describing them as belonging to one of the three classes of negotiable paper. When these words of identification are used, it is unnecessary to state that the document is payable to the order of anyone, as that is understood, unless it is specifically stated that it is not so payable. The law of checks is in general more like that of France than that of England and America, but it differs in two respects. Instead of the crossed check, German practice has developed the check marked *nur zur Verrechnung*, which can be used only for deposit to the account of the payee. Great care has been taken, both in the law and in the bankers' forms, to relieve banks from liability where a check is paid on a forged endorsement. The use of checks is accordingly more limited in Germany than in France or England.

Considerable progress has been made toward the development of a single continental system through the attempted unification of the law of bills of exchange and promissory notes by the Geneva Conference of 1930 and of the law of checks by the session of 1931. This logical step in unification was preceded by local unifications, such as that of Germany and that of the English speaking world. Although the movement for

international unification began in the latter part of the nineteenth century, it is only with the increase of communication and better understanding of the several systems by merchants in various parts of the world that a unification in practice and a desire for a unification in law can eventually be brought about. The original unity of the negotiable instruments law was in like manner the creation of an international mercantile class.

NEGRO PROBLEM. The introduction of African blacks into the western hemisphere was a by-product of the fifteenth and the sixteenth century economic expansion of western Europe known as the commercial revolution. First employed in mines appropriated by the Spaniards in their quest for gold and silver, African slave labor became the basis of the agricultural systems in the British West Indies and in other American colonies engaged in the production of sugar, tobacco, cotton, rice and rum. The traffic in these products, together with the purchase and sale of African labor itself, became a very profitable enterprise, enriching the colonies and increasing the revenue to the British crown; it

led to the accumulation of capital and the expansion of markets and provided the foundation for industrial capitalism. The importance of the role of the Negro in the development of the New World and of modern capitalism is usually overlooked because of the fact that he enacted it unconsciously and as a slave. Even today the position of the Negro in the United States, and to some degree in the rest of the western hemisphere, is conditioned by the fact that his ancestors were enslaved. The habits and attitudes crystallized in the former relationship of master and slave, which find expression in the doctrine of the Negro's racial and social inferiority, in the antagonism between black and white working classes, in the aloof and condescending paternalism of southern gentleness as well as in the missionary spirit of northern philanthropy, still influence the relations of white and black men.

But if the enslavement of their ancestors is considered the sole conditioning factor in the American Negro problem, the question still remains as to why there is no problem of equal dimensions in other countries of the western hemisphere where the Negro has also been enslaved. By applying the method of enumeration used in the United States, according to which any person with a drop of Negro blood is classed as Negro, the total for these countries in 1932 according to one estimate would be 22,541,000 Negroes, or almost 20.2 percent of their entire populations. In comparison with 11,891,000 Negroes in the United States, comprising 9.7 of its total population, there would be in Brazil 11,700,000 Negroes, representing 30 percent of the population, and in the West Indies 7,471,000, or almost 70 percent. These countries, however, in view of the high degree of admixture, make no such general classification. Moreover in all but one or two comparatively unimportant centers of Negro population collective emancipation took place at about the same time as or later than in the United States. If enslavement with comparatively recent emancipation does not in itself constitute a satisfactory explanation, neither does the degree of intermarriage between Negroes, whites and the indigenous Indian population. It is true that data as to race mixture in the various countries are by no means reliable and are based on widely differing standards which make comparisons impossible. But both the estimate for 1910 of the Bureau of the Census, according to which 20.9 of the total Negro population was mulatto

(i.e. with any proportion of white blood), and the conclusion of Melville J. Herskovitz (*The American Negro*, New York 1928), based, it is true, on a small sample, that 80 percent of the Negroes in the United States represent a mixture of Negro, white and Indian indicate that the degree of race mixture is sufficiently high to render confusing and inexplicable the uncompromising color line. Color lines are drawn also in other countries of the western hemisphere, but there they have a more definitely class character and are rooted in economic differentiations which developed within the Negro population on the basis of distinctions made by ruling whites as far back as two centuries ago.

This phenomenon itself was the result of differences in methods of colonization and type of control as practised by the various governing European nations. French and Spanish colonists were for the most part unmarried traders and officials who intermixed freely with natives and blacks, so that as a result color lines could not be maintained. In countries like Cuba, Porto Rico and Brazil the number of those already freed through favor, redemption or miscegenation prior to emancipation was as great as the number of black slaves. Emancipation therefore involved no such serious problem as in the United States and moreover was not an outcome of civil war. The British colonists in North America, on the other hand, came with their families and set out to found permanent settlements and to establish a control in which the natives and after them the slaves could not participate. An exception to this rule was the West Indies, where the large proportion of holdings were in the hands of absentee European landlords and where domination was maintained by a small white settlement.

It is clear at any rate that the special features of the Negro problem in the United States are traceable to the peculiar culture of the country, and particularly of the southern states, in which the bulk of the Negro population has been concentrated. At the outbreak of the Civil War 92.2 percent, or about 4,100,000 Negroes, lived in the south. Of the 500,000 free Negroes in the country there were only 260,000 in the south as compared with over 4,000,000 Negro slaves and 7,000,000 whites.

The extent to which miscegenation was responsible for the free Negro population before the emancipation is indicated by the fact that in 1860 of the free Negro population 36.2 percent was mulatto in contrast to a mere 10 per-

cent of the slave population. But since the number of free blacks outnumbered the free mulattoes in all regions but in the east south central states, where blacks constituted only 48 percent of the free Negro population, a proportion of white blood did not always imply freedom. Although some free Negroes in the south in the pre-emancipation period had accumulated considerable wealth, often inherited from white relatives, and were educating their children in European universities, these were on the whole exceptional cases.

By refusing to absorb the free mulatto the white population of the United States, unlike that of the Latin and South American countries, thwarted the development of a psychology which might have served as the basis of a color caste within the Negro population after emancipation. The closest approximation to such a system was the tendency of numerous small groups of octo-rooms and quadroons to withdraw from black society in Richmond, Charleston and New Orleans in the twenty or thirty years following emancipation. The free Negro as a rule was only a step removed from the status of the slave; for although he enjoyed a *de jure* freedom, his economic opportunities, political rights and social prerogatives were in fact abridged by tradition and statute.

One possible explanation of the failure to permit a large number of Negroes, particularly mulattoes, to gain individual freedom before the Civil War and of the refusal of southern society to absorb the free mulatto lies in the composition of the white population. For the bulk of this population was composed not of slaveholding whites and owners of large plantations as in other countries, but of "poor whites," small farmers, artisans, laborers and tradesmen. The slave owning group in 1860 included about 350,000 families, representing approximately 1,750,000 individuals, while the poor whites numbered more than 5,250,000. The desire of the ruling class to perpetuate a doctrine of racial inferiority was made possible by the antagonism of the numerically preponderant poor whites both before and after emancipation. This antagonism, arising from the necessity of economic competition with blacks, both slave and free, and reenforced by fear of the political and social power of a large black population, furnished the driving power for the enactment into law and the perpetuation in custom of the sharply drawn color line.

This situation was of course aggravated by

methods of emancipation forced on the South. The slave system, which had been a going concern, was overthrown by the drastic method of civil war and by the reconstruction measures imposed on a defeated population and a ruined economy through the medium of a large Negro population whose long bondage made the transition to free labor difficult. It is not surprising therefore that every effort of the federal government to assure political and economic rights to the Negro was thwarted by counter-measures of the southern communities.

The principal effort of the federal government to bridge the gap from slavery to freedom was made by the Bureau of Refugees, Freedmen and Abandoned Lands, which under congressional act of March 3, 1865, was given supervision and management of all abandoned lands and the control of all matters relating to refugees and freedmen. Upon the organization of the bureau agents of the federal Treasury and army officers turned over to it all land abandoned by or confiscated from southern landowners. Such lands aggregated about 800,000 acres; they consisted mainly of farms but also included 1500 pieces of town property. When the bureau was created, the original plan was to return the estates only to persons who could prove past and present loyalty to the Union. The balance was to be allotted to the refugees and freedmen as homesteads. This policy could not be carried out for three reasons: in the first place, much of the property had already been leased by the Treasury agents, and these leases had to be respected; secondly, the amount of land held by the bureau was small, amounting to only .2 percent of all land in the insurrectionary states; thirdly, a change in the land policy was effected by President Andrew Johnson's order of 1868, restoring to all but certain specified groups lands formerly held by them.

The failure to carry out the original land policy caused much disappointment among the freedmen, who had pinned their faith on "forty acres and a mule." This and the loss of over two million dollars of the freedmen's savings by the failure in 1874 of the Freedmen's Savings and Trust Company, a government chartered institution, which was felt to be "morally and practically part of the Freedmen's Bureau, although it had no legal connection with it," led in after years to much adverse criticism of the bureau. But the accomplishments of the bureau were undeniable. It set going a system of free labor and small holdings among the freedmen by aid-

ing them in the purchase of public lands made available by the act of Congress of June, 1866; by supervising the terms under which Negroes were employed on land leased to former planters and northern whites; by allotting small parcels of land to Negroes and later by leasing lands for management and cultivation; and by organizing destitute and vagrant freedmen into self-supporting colonies, for which purpose lands ranging from one to ten thousand acres were used in each state. Moreover it secured the recognition of the black man before courts of law and opened the free public school to him and to the south generally. The attempts on the part of the southern states to adjust the freedman to his new status were embodied in the legislative enactments of the provisional southern governments of 1865-66. These measures, generally known as black codes, gave Negroes the right to sue and to be sued, to testify in court concerning Negroes and to marry according to law. But Negroes could not serve on juries or in the militia and could not vote or hold public office. The legislation officially proposed to curb widespread vagrancy among the newly emancipated blacks was actually designed to maintain a dependable labor supply. Negroes were compelled to sign work contracts, and white magistrates were given wide discretion in adjudging them vagrants. If a Negro left his employer without what was considered reasonable cause, he could be arrested and forced to work. If the employer did not care to reemploy him, he could be hired out by the county or confined to jail. The provisions of the black codes were not the same in all states. In some they were extraordinary measures which aimed to inculcate in a mass of migratory and idle labor the habits of free labor. But in other states, notably Louisiana, South Carolina and Mississippi, where every Negro had to be in the employment of some white person, the measures were so severe that they virtually reintroduced slavery in legal guise.

The enactment of these black codes, the flogging of Negroes who attempted to assert their right to social equality and numerous murders and large scale race riots at New Orleans and Memphis in the autumn of 1866 convinced northern politicians that the South was still unregenerate. Under these conditions, Congress, dominated by the radical wing of the Republican party under the leadership of Thaddeus Stevens and Charles Sumner, passed over presidential veto certain measures which reestablished military rule in the South and set up new govern-

ments in the southern states based upon universal Negro suffrage. The ratification of the Fourteenth Amendment (1868) by these new state legislatures disqualified certain classes of former Confederates from voting and officeholding, gave to the Negro equality of citizenship and denied the right of any state to abridge the privileges and immunities thus conferred upon the Negro. Two years later the Fifteenth Amendment, providing that no person was to be deprived of the franchise because of race, color or previous condition of servitude, went into effect. In 1875 a second civil rights bill gave to Negroes equality of treatment in theaters, railways, hotels and public places.

The effect of this reconstruction legislation was twofold. The Negro leaders hailed it as a triumph of democracy made possible by the Republican party's determination to crush every remnant of slavery and to establish the equality of Negroes with whites. The appearance of Negroes in the capacity of lawmakers and as holders of public offices appeared to confirm this view. In the subsequent twenty years two Negroes were sent to the United States Senate and thirteen to the House of Representatives. Negroes sat in both houses of all the southern legislatures and for a time constituted a majority in some. Thus to the Negro the Republican party became "the ship, while all else the sea"—a dictum which continued to rule Negro political sentiment sixty years after emancipation. But later events showed that the radical character of reconstruction legislation issued from no idyllic contemplation on the abstract rights of man by the Republican party and its supporters. Despite the almost fanatical devotion of Stevens and several other radicals to racial equality, the legislation was designed to effect the supremacy of the rising middle class of the North in the affairs of the nation. This was to be achieved by subjecting the South to the control of the Republican party, the political expression of northern finance and industry. Thus with the aid of the Negro politician and voter the old slaveholding class, which had thwarted the economic expansion of the North, was reduced to political impotence.

This period was, however, of short duration. In the latter part of the 1870's there was a relaxation of federal control signaled by the withdrawal of the military. The reconstruction governments declined and were succeeded by new governments created by the rising class of southern bankers, lawyers and merchants sup-

ported by the white masses. The decision of the Supreme Court in 1883 that the second civil rights bill was unconstitutional resulted in the passage by practically every southern state of Jim Crow laws enforcing the segregation which that legislation had prohibited. The white South had no longer to express surreptitiously its fear of Negro "domination" through the intimidations of a Ku Klux Klan. It was free to handle Negro political aspirations according to its standards. The course it pursued was that of eliminating the Negro by the enactment of laws setting up such qualifications for suffrage as the property and the literacy tests and the "grandfather clause," the last of which was not declared unconstitutional until 1915. Even more important was the "white primary" election of the Democratic party. Either by state law, until such laws were declared to be in conflict with the Fourteenth Amendment, or by the state party committee the Negro has been denied the privilege of participation in the Democratic primaries in most states of the South; and since primary elections are tantamount to election to office, this exclusion renders his vote valueless. From the 1890's on therefore the Negro vote has played an insignificant part in southern politics.

In close conformity with the policy of excluding Negroes from politics other types of discrimination became fixed in the customs and laws of the South; among these were residential segregation, separation of the races in public conveyances and places of amusement, exclusion of Negroes from public institutions and educational discrimination. Mob violence expressed in the form of lynching (*q.v.*) became more and more prevalent and did not begin to decline perceptibly until the beginning of the twentieth century.

Disfranchisement and social discrimination had their economic counterpart in all branches of industry except agriculture and domestic and personal service, occupations to which Negroes had been habituated under the slave regime. The entrance of the Negro into the labor market as a free man and a direct competitor of white workers, made legally possible by emancipation, was in practice thwarted by several factors, not the least of which was the hostility of white workers, expressed in exclusion from trade unions and apprenticeship. This was true not only in occupations and industries which were new to the Negro but even in the handicrafts for which as slaves they had been extensively

trained. It has been estimated that at the close of the Civil War as compared with 20,000 white mechanics there were 100,000 Negroes engaged as blacksmiths, gunsmiths, cabinetmakers, plasterers, painters, shipbuilders, stone and brick masons, pilots and engineers. But in 1890 the percentages of Negroes in seven of the leading crafts in the south were as follows: carpenters 16.1, masons 28.2, painters 10.9, plasterers 33.2, blacksmiths 20.3, machinists 2.5, printers 2.7. When the Negroes were emancipated, the number employed in factories was quite small, not only because these occupations were new to them but because the total factory employment was negligible as the south was predominantly agricultural and the industries stimulated by the war had been destroyed by the Union army. Some black semiskilled and unskilled laborers were employed in the flour mills and tobacco factories of Virginia and North Carolina and in the phosphate industry of South Carolina. They were engaged also in the heavy industries as dock workers and longshoremen, and they helped to rebuild the southern railroads. In the period from 1880 to 1890 southern industry began to play an important role; the cotton textile industry was making noticeable headway and the rich coal and iron deposits of Tennessee and Alabama were being exploited. Blast furnaces, iron and steel mills, fertilizer plants and lumber, saw, planing and cottonseed mills were being built. The jobs, at least the higher and more remunerative ones thus created by the South's industrial awakening, were looked upon by white labor as its monopoly, and either through "gentlemen's agreements" with the employers or through strikes the white workers successfully opposed the employment of Negroes. Employers were more or less ready to acquiesce in the demands of the white workers because of their growing conviction that the black workman was lazy, shiftless and unreliable in the higher industrial occupations. This opposition did not prevent the employment of a considerable number of Negroes in the heavy unskilled and essentially poorer paying occupations, which became known as Negro jobs. These included a few thousand jobs in and about the cotton mills as pickers, scrubbers, washers, firemen or teamsters, some ten to twelve thousand in the brick and tile industry and in the marble and stone quarries. In the tobacco industry Negroes were employed in almost every phase except cigar making in the 1890's, but after 1900 with the introduction of

cigarette machines there was a decided decline in skilled jobs. Large employers of Negro labor were the lumber industry and the steel industry; in 1907 the Immigration Commission reported that 39.1 percent of all southern steelworkers were Negroes. The largest single employer was the Tennessee Coal and Iron Company, which prior to 1907 employed about 4000 Negroes in its manufacturing plants, constituting 25 to 30 percent of the total force. An additional 5000 were in the company's mines. Nearly all of the Negroes employed by the company were common laborers drawn from the surrounding farms. Other types of work requiring common labor went almost exclusively to Negroes—street cleaning and repairing, scavenging, sewer cleaning and digging and railroad building. The wages paid the southern Negro, whether in the skilled or unskilled occupations, were lower than those paid to the white.

Nor was there much opportunity for the Negro wage earner in the north. The small proportion of Negroes in northern industry prior to 1900 is indicated by the fact that in 1890 out of 172,970 Negro industrial workers in manufacturing and mechanical industries, 82.6 percent were employed in the south. At the outset of emancipation, northern capitalists looked upon the new supply of Negro labor which the disorders of reconstruction had set moving to the southern cities as a reserve which could be tapped at will. On the eve of emancipation the secretary of the Interior had proposed that 200,000 southern Negroes be apprenticed for five years under congressional regulations to the constructors of the Union Pacific Railway, which at the time (1863) was already employing 300 Negroes, in a total force of 1500 workers. While nothing came of this proposal, other attempts were made in this period to introduce the Negro into northern industry, frequently in the capacity of strike breaker. In almost every labor disturbance in the steel industry between 1878 and the middle 1880's, in the slaughtering and packing industries and among the coal miners of the middle and southwest between 1890 and 1900, Negro strike breakers were used. A precedent for this practise had been established as early as 1855 and later in 1863, when Negroes were used to break the strikes of white longshoremen in New York, Buffalo and other eastern cities. Similarly in 1867 colored ship calkers were imported from Portsmouth, Virginia, to Boston to defeat the white workers' struggle for the eight-hour day. Negroes first entered the

steel industry in the north in 1875, when colored puddlers were brought from Richmond, Virginia, to Pittsburgh to take the place of white strikers. In the main, however, the steady flow of immigrants furnished northern capitalists with a constant supply of cheap labor enabling them to forego the employment of Negroes except in emergencies. Unskilled as well as skilled occupations were manned by white workers. The opposition of the white workers in the north to the employment of Negroes was no less intense than that of the southerners. Between 1880 and 1890 fifty strikes against the employment of Negroes were reported.

The trade unions, dominated by a skilled craft ideology and viewing the Negroes as an industrial reserve of unskilled workers with no roots in industry, made no serious effort to allay the mutual hostility of the white and the black workers. The three tendencies characterizing the relations of the Negro worker to the labor movement as a whole, which became apparent immediately after the abolition of slavery, have continued to this day: first, craft unionism dominated by a policy of Negro exclusion or subordination; second, labor organization of an inclusive character whose very nature required the admission of all workers; third, an independent Negro labor movement divided to some extent over the issue of race separatism and class unity but inevitably seeking the cooperation of the rest of the labor world.

Immediately following emancipation Negro craftsmen knocked in vain at the doors of the trade unions. Because the craft unions of this period were extremely and consciously decentralized, when attempts were made at national conventions to bring about the admission of all workers regardless of color, the majority of the delegates would fall back on the principle of local autonomy and insist that any attempt by a central body to foist the idealism of a national minority upon apathetic and intolerant local majorities would wreck the future of the craft union movement.

The situation in the National Labor Union formed in 1866 was somewhat more encouraging; under the leadership of William H. Sylvius the union sought an alliance of all workers, white and black, against the "non-producing aristocracy." These years also witnessed the first attempt at the independent organization of the Negro workers. Local movements demanding the enactment of the reconstruction program of equal educational opportunities, equal citizen-

ship and land led to a series of national conventions of black workers, where the issue of race separatism versus class solidarity was fought out. Class unity won and the Negro Labor Congress founded in 1869 sent a delegation in 1870 to the National Labor Union, which the latter enthusiastically admitted. But despite the good will of the National Labor Union, the growing influence of the exclusive crafts in its councils soon aroused the suspicions of the Negro workers and put an end to the attempts at class unity. Meanwhile the Negro Labor Congress under the domination of Negro Republican politicians was turned into a party tool, losing every vestige of its working class character.

The Knights of Labor, which succeeded the National Labor Union, made special efforts to organize all workers regardless of skill or race. At the height of its power in 1886 the Knights claimed 60,000 Negro members. With the decline of general and industrial unionism and the ascendancy of craft unionism Negro union membership again began to fall off. In 1900 the American Federation of Labor included no more than 32,619 Negro workers. Even this figure seems greatly exaggerated. It includes 20,000 miners and 6000 longshoremen and while the latter figure is probably correct, the former is undoubtedly much too high.

The opposition of white workers in the north as well as in the south, the reluctance of employers to hire Negroes except in the unskilled branches of industry or as strike breakers and the differential wage policy affecting white and black labor increased the Negro's dependence upon agriculture and domestic service. The Civil War had left the South weak and prostrate. Shorn of its chief form of wealth, human chattels, it continued to rely upon cotton farming as its principal economic activity and looked for its labor supply to the freed Negro, long habituated to the system. Cotton culture thus maintained its traditional hold on the labor of black men. Of the total of 1,728,325 Negroes in agriculture in 1890 and the 2,881,454 in 1910 the number in branches other than cotton culture, such as dairying, stock raising and mixed farming, constituted less than 0.5 percent.

In most cases these Negro cotton farmers became tenants renting land according to the share system. A small number rose to the landowning class by settling abandoned lands, buying land auctioned by the government for taxes and by purchasing the small parcels into which the great estates were divided by impoverished

planters at the close of the war. For the most part, however, they were employed as laborers by their former masters and were thus maintained as a rural proletariat whose migration to the centers of industry was forestalled by lack of industrial opportunity and by their own habituation to a rather easy going existence under southern paternalism as well as by the gradual spread of peonage.

Thus the 1,106,728 Negro farm laborers constituted 64 percent of the total number of Negroes employed in agriculture in 1890. Between 1890 and 1910 there was a numerical increase of 837,027 Negro farm laborers, or a percentage increase of 75.6, and they now amounted to 67 percent of the total. But after 1910 the number began to decrease, showing a phenomenal decline after the World War.

On the other hand, many Negroes between 1890 and 1910 had risen to a position of independent proprietorship, while others were tenants paying a fixed rent either in money or in crops. In this period the number of Negro farm owners rose from 120,738 to 218,972 and that of tenants from 469,928 to 672,964. The overwhelming majority of these were in the south. By 1910 Negroes owned or were in the process of owning 12,847,348 acres of land valued at \$620,587,241. This appraisal was chiefly on the basis of land, since the capital equipment was on the average meager. In spite of this admitted rapid progress in landownership the Negro farmer stood in an inferior position to his white neighbor with respect to productive efficiency, financial resources and credit facilities. Low yields, lack of self-financing, which further strengthened the crop lien system, and higher interest charges made the problem of the Negro farmer even more serious than that of the white cotton producer. The tenant farmer, on the other hand, was beset with the evils of the share crop system, under which the landowner supplied the tenant with tools, seeds, farm equipment and sometimes clothing in return for a stipulated share of the crop; the books were usually kept by the landlord, who also marketed the crop. On the whole the system kept the tenant in a state of perpetual debt. Since he could not leave the land until this debt was paid he was virtually a peon. Yet during the decade 1890-1900 many tenants rose to the status of owners. But in the next twenty years the situation changed. After 1900 the proportion of Negro tenant farmers increased in practically every southern state, while the percentage of

owners decreased. This was true also of the white farmers, but the proportion was greater among the blacks. In 1925 it was estimated that 42 percent of the white farmers and 76.5 percent of the Negro farmers in the south were tenants. Between 1910 and 1925 there was a decrease in four southern states of 88,023 farms, of which 83,780 were Negro farms. The peak of farm acreage held by Negroes was reached in 1920 with 41,432,182 acres, mostly in the south; by 1930 this had been reduced by 4,000,000 acres. This change was partly the result of the increased price of land and the consolidation of farms under capitalist management which left actual cultivation in the hands of tenants and laborers and partly the result of the migration of whites and Negroes to the cities.

The next largest occupational group was in domestic and personal service. In 1890, 956,754, or 31.1 percent of gainfully employed Negroes, were domestics; by 1900 the number had risen to 1,317,859, or 33 percent. The percentage for 1910 and 1920 was far lower, 21.6 and 22.1 respectively, and the absolute numbers had decreased also. Probably as a result of the depression the number thus occupied rose in 1930 to a high point of 1,576,205, or 28.6 percent. Whereas in 1890 probably four fifths of all Negro workers in domestic and personal service were to be found in the south, the subsequent periods of migration undoubtedly changed this ratio considerably. Finally, while prior to 1910 the number of men employed was almost equal to that of women, after that year it dwindled to about one third. In the census years 1910, 1920 and 1930 male Negroes in domestic service accounted for 8.4, 8.4 and 11.6 percent of the total number of male Negroes employed and the percentage for women was 42.4, 50.3 and 62.6 respectively. An examination of the figures shows that in domestic service itself and in the power laundries the ratio of women to men was four or five to one. The economic position of the Negro woman is probably the lowest in the entire working population.

The hold of agriculture and domestic service on the economic life of the Negro was broken by the great migrations to the northern cities which reached their peak between 1916 and 1924. Discontent with the system of farm tenancy and revolt against Jim Crowism and the denial of civil rights and educational privileges played a part in stimulating the urban and particularly the northward migration. But the factor of preponderant importance was the opening up

of new opportunities for employment caused by wartime expansion of industry and the stoppage of immigration. As early as the 1880's Negro farm hands showed a tendency to drift to the cities of the south, forsaking farm labor for work in the mines, lumber camps and sawmills. Beginning with 1900 the movement to these cities increased perceptibly, including not only farm laborers but also tenants and some owners. Since 1900 over a million Negroes have migrated to southern cities. By 1930 the number of Negroes living in southern cities exceeded the number in northern cities. The migrations to the north, because of their greater social and economic significance, justly commanded more attention. This movement cityward was part of a general movement away from the land common to all industrial countries. The Negroes, who at first lagged behind other population groups in this tendency, have been catching up during the last generation.

The movement to the north began at about the same time as the urban shift in the south; although the numbers were small for each year, the drift was steady and by 1910 the number of Negroes in the north began to reach significant totals. The two great waves of Negro migration occurred between 1916 and 1919 and between 1921 and 1924. From 1890 to 1910 the number of southern born Negroes in the north and west increased at an average of about 67,000 in each decade. Between 1910 and 1920 the net increase of the southern born Negroes in these sections was 321,890, or about 45 percent. Between 1920 and 1930 the number rose to almost 1,000,000, or 63 percent of the total. The approximate volume of these waves can be gauged by an examination of the changed distribution of Negro population from 1860 to 1930, the proportions which it formed of populations in the various sections of the country and the increase in the Negro population of ten leading industrial centers in the north since 1910, as shown by Tables I, II and III.

Although discontent with southern conditions played a part in stimulating this northward migration, far more important were the new opportunities arising out of the conditions mentioned above and the promise of freedom from social discrimination. Thousands of the Negroes who migrated to the industrial centers to meet the shortage of labor did not wander north spontaneously but were brought there by the labor agents of large employers. So great was this drain upon the labor resources of the

south that many southern states and local communities passed laws designed to stop it. But neither legal measures nor a definite propaganda

on the part of the south could stay the trend. The urbanization of the Negro meant a shift from agriculture to industry. Table IV shows

Source: United States, Bureau of the Census, 15th Census, 1930. *Occupational Statistics: Color and Nativity of Gainful Workers* (Washington 1933) p. 4-5. The figures for Negro percentage of total persons in each occupation 1910 and 1920 have been computed by the authors.

the changing occupational distribution of Negro workers and the proportion which they constitute of the total employed. The lower economic status of the Negro is shown by the fact that although in 1930 Negroes constituted only 9.4 percent of the total population of ten years and over, they accounted for 11.3 percent of the gainfully employed; in the east south central states these percentages were 27.2 and 33.5. Of the total Negro population 59.2 percent were gainfully employed as against 56.1 percent of the foreign born and 47 percent of the native whites; the higher proportion of Negro working women and children accounts in part for the difference.

The migrations profoundly altered the relation of the Negro to industry. While prior to the World War Negroes constituted an industrial reserve upon which employers could draw in times of labor shortage or strikes, they had become by 1929 an integral part of the labor force in practically every important industry. For the most part they were recruited for work in heavy industry, being assigned the jobs which native Americans or Americanized foreign born workers did not want or from which they were rapidly passing. Within a few years the percentage of Negroes engaged in heavy work which required

little skill or experience, in the steel mills and blast furnaces, the foundries, the automobile and car plants, the packing houses and the unskilled branches of the building and construction industries, showed a striking increase. In 1930 Negroes constituted 22.7 percent of the building laborers, 16.2 percent of the unskilled workers in the steel industry and 25 percent of the unskilled in the meat packing industry. They comprised 60 percent of the tobacco workers, 89.5 percent of unskilled hands in saw and planing mills and 31.7 percent of the longshoremen in 1920. Although the figures are not strictly comparable, it may be stated that whereas in 1890 Negroes accounted for 3.4 percent of the total number of employees in manufacturing and mechanical industry, by 1930 the proportion had risen to 7.3 percent.

The migrations also changed the ratio of rural and urban Negroes, as is indicated in Table v, showing comparisons with white rural population. Although the Negro is still predominantly rural the rate of his urbanization in the past fifty years has been far more rapid than that of the whites, and outside the south the degree of urbanization is greater among Negroes than among whites.

Negro Problem

E., *Farm Population of the United States*, United States Bureau of the Census, Census Monograph, no. 6 (1926) p. 100. For 1930 figures: United States Bureau of the Census, *Abstract of the Fifteenth Census of the United States* (1933) p. 83.

The readjustment of these southern peasants to urban and industrial life was not easy. Even those who came from southern factories had to meet the greater exactions and faster pace of northern industry. Employers complained that the black worker was unsteady, that he would leave after pay day and not return to work until his money was spent, that he ran heavily into debt so that garnishments on his wages were frequent. Many of those who hired Negro labor when no other was available looked upon these failings as racial traits and replaced their black workers with white as quickly as they could. But as the Negro migrant adapted himself to his new environment, the complaints of employers diminished. Labor turnover declined and the black men, particularly when they decided to remain in the north and brought their families up with them, became as steady and reliable as any other new group of workers.

Even more difficult were the social adjustments. The sudden influx of thousands of members of a race which the white American was wont to regard as inferior caused all sorts of complications. Negroes underbidding for jobs tended to depress wages. Competition for housing in the sections into which Negroes moved

aggravated an already acute housing shortage caused by wartime suspension of building and contributed heavily to the raising of rents to fantastic figures for both whites and blacks. Residential segregation, practised in the north no less than in the south, added further complications. All available housing space in the Negro sections was quickly taken and the newcomers were obliged to seek homes in sections monopolized by whites. The prospect of having Negro neighbors caused whites to abandon these blocks and to seek homes in other crowded areas, where the cost of housing quickly rose in response to the new demand. Meanwhile landlords in sections into which Negroes were moving attempted to stop the black influx, which they believed doomed their property to rapid deterioration, by boosting rents to black tenants far above the sums they charged whites. In some places white home owners' and tenants' leagues compelled landlords to refuse to rent to Negroes. In other sections, where such pressure failed, resort was had to threats and actual physical violence. Very serious race riots, in which 39 Negroes and 8 whites were killed, occurred in East St. Louis, Illinois, in 1917; and in 1919 there were 26 riots, the most serious of which were in Washington, D. C., and in Chicago. Yet it is surprising that the violence and bloodshed accompanying so huge a mass movement was not far greater. Perhaps the remarkable degree of solidarity shown by the Negroes and their readiness to fight back when threatened made the whites hesitate to challenge them and were responsible for the comparatively peaceful adjustment.

One of the immediate social results of the migration was the rousing of the Negro to a high degree of race consciousness, which was further augmented by the militant spirit of discharged black soldiers after the World War who remained in New York and other northern centers instead of returning home. These ex-soldiers protested bitterly at the official segregation policy to which they had been subjected in the army while the government was arousing the country to fight to "make the world safe for democracy." Now that they had become civilians again in the comparatively tolerant north they were determined to get their full rights as American free men.

This militant race consciousness was at once reflected in and stimulated by a group of rising Negro poets and novelists, the most notable of whom was Claude McKay; and journalists like

Chandler Owen, A. Philip Randolph, W. A. Domingo and others, editors of such radical publications as the *Messenger*, the *Crusader*, the *Emancipator* and the *Challenge*.

The discontent expressed by much of this writing was economic as well as social. Not only did it voice objection to barriers which the northern no less than the southern white world placed in the way of equal treatment of the races but it protested against economic exploitation by the owning classes, frequently mistaken for racial discrimination but in reality fundamentally the same sort of exploitation from which the whole working class suffered.

Some five or six years after the war the race consciousness which had expressed itself in economic radicalism and social protest began to be voiced through literary channels. Claude McKay, Langston Hughes, Countee Cullen, Rudolph Fisher and James Weldon Johnson are but a few of the poets and novelists of high talent whose writings received wide acclaim. The work of these writers together with the sudden manner in which the Negro was injected into northern life aroused white interest in Negro revues and in the spirituals, while the general restlessness of the time was expressed through jazz, a musical dance idiom whose creation is credited to the Negro, but in whose development members of both races have participated equally. This artistic expression, the so-called New Negro movement, was hailed by some as a distinctive Negro art while others maintained that it was merely a reflection of general American conditions with no distinct racial characteristics.

In the new northern environment all of the clashing social philosophies and schools of thought which had been agitating the Negro people since emancipation took on new and revitalized meaning. These tendencies may be divided into four broad classes: first, interracial conciliation, which attempts to cultivate the good will of the white upper classes; second, civil libertarianism, which seeks to remove all discrimination against Negroes and to guarantee to them full social and political equality and economic opportunity, through legislation, court action and a propaganda of enlightenment; third, militant race consciousness, which holds that the interests of the two races are inevitably divergent; fourth, class consciousness and class unity, which are postulated upon the theory that the interests of the two races are identical and can be served only by united action on the part

of both against the capitalist system which exploits them. Few leaders or organizations represent any one tendency to the exclusion of all others. Elements of all can be found in almost every platform.

The leaders of the emancipation period, particularly Frederick Douglass, while recognizing the need for unity of the working classes, both black and white, stressed the second program. They looked for the attainment of equal citizenship and education by political means and with the help of the Republican party.

The reaction of the 1880's and 1890's resulted in a retreat from this position and an emphasis on interracial conciliation. This view has its roots in what has come to be called the Uncle Tom psychology of the period of slavery. Since under slavery the black worker had to be properly cared for in order to remain an asset to his master, it happened that on some of the plantations he was better off than the vast majority of the poor whites, whose bare subsistence came out of the undesirable marginal lands left to them. In the towns the slave artisan with the power of the master class behind him outnumbered by five to one the white artisan, who could not compete with him. The antagonism was further intensified by the fact that it was from the poor white class that the overseers and slave catchers were drawn. Slaves thus came to look to "good masters" for support; and when it became apparent that emancipation had changed their legal status but had left their economic relation to their masters largely intact, they continued in this dependence. The reliance upon "good white men" became intensified when northern philanthropists began to build institutions for the relief, education and moral and material improvement of the freed slaves. Since these missionaries who came south imbued with the abolitionist zeal found no cooperation among the southern whites and were themselves barred from all "good society" because of their association with Negroes, they set up separate Negro schools and churches, which later became the basis of the dual educational and welfare systems characteristic of the southern states.

Later when the big foundations—the Peabody, Slater, and Rosenwald funds and the Rockefeller Foundation—set out systematically to improve the condition of the Negro, they felt the need for the cooperation of the southern upper classes. These classes were now glad to cooperate if northern philanthropy would keep its hands off the southern social structure. The

new South welcomed the establishment of Negro churches, schools, colleges and welfare agencies, provided they were separate and distinct from those of the white world. Philanthropy, thus confronted by the wall of race separation, accepted the dictates of the South's ruling class and proceeded to set up separate Negro institutions. Its action was not merely a resigned acquiescence in a necessary evil but was grounded in a positive philosophy of interracial conciliation within the framework of established arrangements.

In their efforts to help the Negro some of the foundations are attempting to bestow upon him social and educational agencies duplicating those of the white world. They seek to expand southern Negro colleges into universities engaging in research and professional training and granting master's and doctor's degrees. They want to set up separate Negro hospitals in northern cities. The net result of this would be to encourage segregation on the part of the northern hospitals and universities, and since it would be generations before Negro institutions could compete with the white, the black man would be condemned to lower standards of service and education. Thus northern philanthropy, already a powerful instrument for fortifying white supremacy, threatens to become an even more effective tool for "keeping the Negro in his place."

The outstanding Negro spokesman of northern philanthropy was Booker T. Washington. Washington was educated at Hampton Institute in Virginia, one of the first important institutions for Negroes set up by northern philanthropy; and in establishing Tuskegee Institute in 1881 in the depths of the Alabama black belt he followed the program of the former. Hampton and Tuskegee aimed to teach the Negroes skilled trades, agriculture and household arts and to train teachers to go out among their people. Such institutions would replace the training formerly given to the black slave by his master, compensate the freedman for his weak position in competing with the white artisan who barred him from apprenticeship and trade unions, and help to overcome the handicap involved in the introduction of new machinery, which rendered much of the Negro's previous skill and training obsolete. The very crafts and trades which they were teaching were fast disappearing, if not entirely outdated. This fact was recently recognized by the Tuskegee and Hampton authorities when they changed their

curriculum, greatly modifying their emphasis on industrial instruction and concentrating instead on agriculture and teacher training.

For the most part the enormous influence of Washington and Tuskegee lay in the philosophy which they taught. "The wisest of my race," declared Washington, "understand that the agitation of questions of social equality is the extreme folly. . . . No race that has anything to contribute to the markets of the world is long in any degree ostracized." He urged the Negro to accept the position in which he found himself, to ask no privileges which were not freely granted him, to work hard and acquire such economic independence as he could. His salvation rested upon the good will of the white upper classes. Appealing to this good will, Washington declared: "Casting down your bucket among my people, helping and encouraging them . . . to education of head, hand and heart, you will find that they will buy your surplus land, make blossom the waste places in your fields, and run your factories. While doing this you can be sure in the future, as in the past, that you will be surrounded by the most patient, faithful, law-abiding, and unresentful people the world has ever seen. As we have proved our loyalty to you in the past . . . we shall stand by you with a devotion that no foreigner can approach, ready to lay down our lives, if need be, in defense of yours, interlacing our industrial, commercial, civil, and religious life with yours in a way that shall make the interests of both races one. In all things that are purely social we shall be as separate as the fingers, yet one as the hand in all things essential to mutual progress."

On the question of labor organization, the central problem of the modern wage earner, Washington did what he could to discourage the black worker from putting his trust in working class unity. As he saw it, "the average Negro who comes to town . . . does not understand the necessity or advantage of a labor organization which stands between him and his employer. . . . [He] is more accustomed to work for persons than for wages. When he gets a job, therefore, he is inclined to consider the source from which it comes. . . ." He "does not like an organization which seems to be founded on a sort of personal enmity to the man by whom he is employed. . . ."

Negro leaders, taking their cue from Washington, have preached even more directly and explicitly the doctrine of avoiding the white worker's union and relying instead upon the

"good" white man. "I believe that the interest of my people lies with the wealth of the nation and with the class of white people who control it," declared Bishop Carey in Chicago in 1924. "The black people at large should align themselves as far as possible with the wealthier classes in America," wrote the editor of the Negro paper, the *Chicago Whip*, opposing an attempt to form a union of Negro sleeping car porters in 1926.

The Washingtonian distrust of the labor movement stems partly from the traditional hostility of the black and white working classes and partly from Negro dependence on the white master class and later upon northern philanthropy. But there is also another and equally important factor: an abiding faith in the good American notion that the way to get on in the world is to begin at the bottom and through hard work, enterprise, thrift and efficiency work one's way up to the top of the scale. The Negro should not fight his employer but should learn to be an "efficient," reliable and loyal workman. Ultimately by practising the great middle class virtues of thrift, enterprise and efficiency, the worker could himself become a business man. In order to encourage this attitude Washington in 1900 established the National Negro Business League.

It was not until the period of the migrations that the National Negro Business League under the leadership of Major Robert R. Moton, Washington's successor, became a really important organization, making the ideal of an independent black economy within the confines of white society a potent force in every Negro community in the United States. As a matter of fact the idea of an independent Negro economy antedated the Business League by half a century. It was first put forward in the 1850's, while the Negro masses were still enslaved, by Martin Delany and McCune Smith as a means of economic salvation for the free Negro.

Negro businesses are chiefly a product of segregation; they are "defensive enterprises." It is estimated that there are at present about 70,000 Negro business undertakings. The largest number of successful ventures—restaurants, beauty parlors, barber shops and funeral parlors—are in the field of personal service, where racial discrimination is general. The most highly capitalized of the Negro financial undertakings are the insurance companies. These developed from the burial and mutual aid societies and secured their foothold as a result of the policy

of large white companies of excluding Negroes or charging them higher premium rates. The Negro banks, although faced with a restricted investment and typically subject to poor management, owe their origin to the refusal of white banks to extend credit to Negro home owners and business men. In 1930 there were 50 insurance companies owned and operated by Negroes; 13 of these were legal reserve and the others were assessment associations. Twenty-five of the largest companies reported current insurance amounting to \$205,335,433 in 1930. In 1927 there were 33 savings and commercial banks; between 30 and 50 building and loan, mutual saving and loan or investment associations. The total assets of the 33 banks were \$15,292,820; capital was \$2,086,369; total surplus was \$485,911; and total deposits were \$11,900,250. The development of these and similar institutions is advocated as the basis of a Negro middle class economy. That such an economy has serious limitations seems to be evidenced by the failure of Negro banks and the difficulties of several of the largest insurance companies. From 1880 to 1930 no fewer than 130 Negro banks had been organized, whereas today there are no more than 25. The greatest limitation upon the development of Negro business enterprise arises from the fact that basic industry, essential raw materials, transportation and finance are all controlled by white capital.

Because of these serious obstacles Negro business affords no real foundation for the growth of a black middle class. Such a class has its only substantial basis among the professional and white collar workers, whose development is conditioned upon certain economic needs of a growing industrial proletariat. Not only was the movement of the Negro to the northern centers of industry not marked by a decline of segregation and social discrimination, but, on the contrary, northern whites were as pronounced in their distaste for serving Negroes in personal capacities as their southern brethren. This has resulted in the increase of personal service enterprises with a corresponding increase in the number of Negroes in the white collar class. In 1920 there were 34,434 Negro stenographers, bookkeepers, advertising and insurance agents, salesmen and clerks in stores, floorwalkers and inspectors. In 1930 the number had increased to 59,301. There was also an increase in the size of the Negro business and professional classes. In the business class bankers, brokers, real estate agents, retail and wholesale dealers and under-

takers numbered 26,822 in 1920 and 35,833 in 1933. In the professional class clergymen, college presidents, professors, teachers, dentists, lawyers, trained nurses, social workers and physicians numbered 65,472 in 1920 and 95,454 in 1930.

Advocacy of racial separatism and ruling class conciliation is represented by a number of institutions in addition to the industrial schools. Most important of these are the evangelical churches, the Young Men's Christian Association, the Interracial Commission at Atlanta, Georgia, and its various local committees and the Urban League. Of these the most important, despite a recent decline in influence, is the church. The role of the Negro church is unique; for it is not merely a place of religious worship but the very center of Negro social life. This influence is another instance of the heritage of slavery. The church won its hold over the slaves by giving them an emotional release and substituting heavenly for earthly hopes. But the present day importance of the Negro church lies in the fact that it is the one large institution where the black man can find avenues of self-expression and enterprise free from the white man's direct intrusion and control.

The Interracial Commission is the organized expression of the liberalism of the "New South" in race relations. Functioning through interracial committees in various cities, it tries to combat race prejudice and to promote interracial good will through lectures, discussion groups and forums, and courses in the southern colleges for whites. In the northern industrial centers the commission has its counterpart in the National Urban League and its various locals. These are social welfare agencies administered by Negroes, directed by boards of white and Negro trustees and financed largely by white employers and philanthropic agencies and to a small extent by contributions from the local Negro communities. The leagues engage in a large variety of activities: they carry on many functions of social relief agencies and operate free employment bureaus. During the migrations they played a very important role in procuring jobs for Negroes, acquainting employers with their desirable qualities as workers and helping the migrants to adjust themselves to their new environment. In their eagerness to find jobs for Negroes local leagues frequently furnished labor to break strikes. The National Urban League, however, saw the importance of trade union membership for placement in skilled

jobs and waged a campaign to induce the unions to open their doors to black workers.

The teachings of Booker T. Washington were opposed almost at the start by Dr. W. E. B. Du Bois, who in his famous book, *The Souls of Black Folk* (Chicago 1903), demanded full social and political equality for the Negro. He attacked Washington's emphasis upon industrial education and demanded equal educational opportunities for Negroes. In answer to Washington's advice that the Negro eschew politics and concentrate on learning how to be a good workman Du Bois has recently declared that "a disfranchised working class in modern industrial civilization is worse than helpless. It is a menace not simply to itself but to every other group in the community. It will be diseased; it will be criminal; it will be ignorant; it will be the plaything of mobs, and it will be insulted by caste restrictions." His position stems directly from that of Frederick Douglass and the other Negro leaders of the reconstruction period. The Washington philosophy, which many think was an advanced position for its day, was reactionary from its inception and represented a step backward from the Negro leadership of the preceding generation.

Du Bois and the National Association for the Advancement of Colored People, which he helped to found in 1909, have for a generation demanded the elimination of all social and legal restrictions distinguishing the black citizen from the white. The central tenet of their philosophy is that each individual Negro is entitled to the same rights as each individual white person: the right to enter public places, the same accommodations on public conveyances, equal expenditure of public funds for education, the right to live wherever he chooses, the right to work without discrimination and the right to vote. By confining its activities to the field of civil liberties the association has neglected to adopt an economic program. Even when it has interested itself in economic issues, as in its struggle against trade union discrimination, its campaign has always been based on the issue of civil liberties rather than on the principle of labor solidarity.

Both the Washington and Du Bois philosophies postulate the ability of Negroes and white men to live together in fundamental harmony in spite of their antagonisms. The intensification of competition growing out of the migrations, however, led thousands of Negroes to believe that the barriers of race were too high to be

hurdled. This attitude culminated in the "back to Africa movement" of Marcus Garvey, originating about 1914 and later developing into an international pan-African movement. The black man, Garvey insisted, could never find a really decent home in America, a white man's country. For the time being of course he had to get along as best he could. His worst enemy was the white worker, his greatest competitor and rival. Since the white employer was selfish, he would employ anyone who would do his work. The black worker should therefore align himself with the capitalist against the white worker and should work for less than the white worker's standard wage in order to be secure in his job. Meanwhile the Negro should also build up his own racial enterprises to strengthen his economic position and further consolidate his independence.

The more practical activities in which Garvey was engaged were the organization of several cooperative grocery stores and the founding of the Black Star Steamship Company for trade between Negroes in the United States and those in Africa and the West Indies. After accumulating at least \$1,000,000, which he expended upon unseaworthy vessels, extravagant living and uneconomic ventures, Garvey's bubble burst and he was deported to his native country, Jamaica, in 1927.

Although Garveyism was able to gain a tremendous hold upon Negroes in all parts of the country, its principal influence was among the new migrants in northern cities immediately following the World War. These simple people, fresh from the fields and unaccustomed to their strange surroundings, turned to this emotionally satisfying movement, which offered them an escape from their troubles to a promised land of their own. Garvey's propaganda was as glamorous and theatrical as he could make it. He formed organizations with elaborate names—the Universal Negro Improvement Association, the African Communities (Imperial) League—while the officers took long and imposing titles and wore gaudy uniforms. Still the movement made little headway among the older and more sophisticated industrial workers. They attended Garvey's meetings and cheered the speeches with the rest, but they refused to follow his industrial advice. This was particularly true of Negroes who gained admission to the unions and became convinced of the advantages of working class unity.

The outstanding examples of working class unity in the official labor movement were the

miners' and longshoremen's organizations. With the exception of these and a few other unions the organized labor movement made little effort to bring Negroes into its ranks. On the contrary, many organizations barred Negroes from membership. The Industrial Workers of the World, industrial in structure and revolutionary in objective, has no color discrimination; it has organized blacks and whites in a single organization even in the darkest south and has led them together in successful strikes, particularly in the lumber industry.

Although the American Federation of Labor, through its Executive Council, has declared that no union drawing the color line could affiliate with it, it has never taken any steps to compel those of its internationals which openly bar Negroes to change their policy. There are nine such organizations in the federation today. In addition there are eleven important unions outside the federation which follow a similar course. When the migrations were bringing thousands of Negroes into industry each year, the A. F. of L. firmly reiterated its old compromise policy, under which Negroes who could not enter the regular craft unions were to be organized in separate locals directly affiliated with the federation. But no really determined attempt was made to organize the Negro even in this unsatisfactory fashion. The American Federation of Labor is the creature of the craft internationals, whose purpose is to keep their membership as small as possible in order to raise the value of the craftsman's services. If whole classes of workers, like Negroes, can be automatically excluded, the problem becomes so much the simpler. The attitude of the miners' and other industrial unions arises out of the fact that they must organize whole industries from top to bottom. Moreover these unions, especially the needle trade organizations, are socialistic in outlook and have welcomed Negroes into their ranks. In 1928 the total Negro membership in the federation was only 44,476. This included 5000 miners, about 5400 longshoremen, 3000 Negro musicians, 10,000 maintenance of way employees, over 5000 hodcarriers, building and common laborers and 2000 federal employees, while the operating engineers, hotel and restaurant employees and brick and clay workers were represented by over 1000 each. Negro locals directly affiliated with the American Federation of Labor comprised more than 3000. The highly fluctuating and unstable membership of independent unaffiliated Negro unions was reported as

11,730 and consisted mainly of railroad workers.

The theory of the class unity of black and white workers, while it achieved practical expression in those trade unions which admitted the Negro freely, has perhaps received most attention from the radical political groups. The Socialist party has always preached equality for the Negro. But it has never outlined a distinct policy for dealing with the problems involved. The Communist movement, however, brings the Negro issue into the forefront. Every manifestation in its ranks of race prejudice, or "white chauvinism," as the party calls it, has been severely punished. It has played an outstanding role in the Scottsboro case and has carried on some agitation among Negro share croppers. Yet despite its truly heroic efforts the Communist party has been no more successful in its appeal to the Negro than in its appeal to the white worker. While this failure must be ascribed largely to general causes, among which must be cited the unity of the Negro population of all classes, a unity for which white policy is responsible, there are specific features of Communist policy which in part explain its lack of success. The party position fluctuates between the assumption that the American Negro question is a colonial problem involving the necessity of freeing the black belt from white "imperialist" domination and the view that it is fundamentally the same as the problem of national minorities in other countries and should be settled according to the Soviet method. At the same time it recognizes the likelihood of prolonged capitalistic government in the United States. The solution is sought in nationalistic terms, through self-determination. The party would set up a Negro republic composed of several hundred contiguous counties in which the majority of the population is black. But this area is an integral part of the economy of the south and is surrounded by sections in which the black population tapers from one half to one quarter or less of the total population. It is this whole region in which the colored population is concentrated in such varying degrees, which is actually the black belt. The Communist "republic" would include the important cities of Richmond, Memphis, Vicksburg, New Orleans, Savannah and Norfolk with an aggregate population in 1930 of about 754,000 whites and 374,000 blacks. The scheme is so fantastic and remote that it has failed completely to catch the imagination of the Negroes, who want full social and economic equality with the whites in their

common country, not a Jim Crow republic established by statistical manipulation which would encompass huge white cities and a huge white minority and would cut a swath through the unified economy of the south. Moreover there is every indication that in the future the Negro population will become more and more dispersed. Recent mechanical contrivances which promise to change the whole technique of cotton culture will hasten this process.

The party recognizes the fact that the 2,500,000 Negroes in the north and west (who cannot be classed as a "colonial minority") have no direct interest in the proposed republic and that their problems are to be solved by equal rights rather than self-determination. But it holds the southern republic is necessary to the welfare of the northern Negro, who will remain "an oppressed national minority" until the Negroes of the south are freed.

The official party view has been strongly criticized by the so-called right opposition, which holds that there is no basis for Negro nationalism in this country and insists that the Negro, although occupying the status of a distinct and oppressed caste, is an integral part of the American people.

However absurd the black belt republic may be, the Communist party has done more than any other group in recent years to dramatize racial discrimination. This it has accomplished by assuming a leading role in the so-called Scottsboro case, in which eight of the nine Negro boys charged with rape on flimsy evidence were sentenced to death by a hostile Alabama jury in 1931. The party, operating through its affiliate, the International Labor Defense, carried the case to the United States Supreme Court and obtained a reversal in 1932 of the Alabama verdict on the ground that the defendants were not allowed adequate counsel. The second trial, held in the light of world wide publicity, focused attention on the fact that it was the custom of the southern states to deny Negroes the right to sit on juries although the practise had been declared illegal prior to the reversal of the Scottsboro decision by the Maryland Court of Appeals in setting aside a conviction. In carrying the case to the Negro masses in the northern industrial centers the party was able to arouse an unprecedentedly articulate protest among them without, however, winning them to the party or its program.

It should not be assumed that the discrimination practised against the Negro has completely

blocked his progress in the south. The scope and limitations of this progress in the field of education are illustrated by statistics as to illiteracy and educational opportunities. In 1860 it was estimated that 97 percent of the total Negro population was illiterate; this was reduced by 1870 to 80 percent, by 1890 to 57.1, by 1900 to 44.5, by 1910 to 30.4, by 1920 to 22.9 and by 1930 to 16.3. White illiteracy had been diminished by one half from 1880 to 1920, whereas Negro illiteracy had been cut by two thirds; but the Negroes who in 1920 constituted only 9.9 percent of the population accounted for 37.3 percent of the number of illiterates. The urban Negro population shows a far lower proportion of illiterates than does the rural, and for the age group from 10 to 15 years urban Negro illiteracy is one fifth that of rural. For the south alone in 1930 Negroes were 19.7 percent illiterate in comparison with a percentage of 3.7 for native and 9.8 for foreign born whites. Negro illiteracy in the north was cut down from 7 percent in 1920 to 4.7 percent in 1930 as compared with 0.6 percent for native born and 10.5 percent for foreign born whites.

In the schools maintained for Negroes salaries of teachers are lower (an average in rural schools in 1929-30 of \$388 as compared with \$945 for white teachers), the school term is shorter by about one fifth and there is a higher proportion

of pupils per teacher than in the white schools. These differences arise from the unequal distribution of state funds for the education of Negroes and whites and from the limited opportunities for Negro secondary education, as shown by Table VI. It is generally held, however, that even if the funds were administered equitably it would be impossible, especially in view of the low per capita wealth of the south, to maintain two separate systems providing first class facilities for both races. The inequitable distribution of the state funds has thrown a large degree of the responsibility for the education of the Negro upon the federal government. Through the land grant act of 1862 and the Morrill-Nelson Fund Act of 1890 special contributions were made with the provision that no state maintaining a biracial school system is eligible to receive a share of the grant unless it is divided equitably between the races. The increased support given by the federal government to Howard University, which is on the way to becoming a sort of national university for Negroes, and the contributions of the wealthy foundations to some of the small Negro colleges founded after the Civil War by northern philanthropy make possible the chief opportunities for the higher education of Negroes. While these provisions may be far from satisfactory, higher education is without doubt better provided for than the

TABLE VI

STATE EDUCATIONAL FUNDS FOR NEGROES AND NEGRO HIGH SCHOOLS IN THE SOUTH, 1925-28

Source: Adapted from Robinson, W. A., "Four Years State Accredited High Schools for Negroes in Seventeen Southern States" in *National Association of Teachers in Colored Schools, Bulletin*, vol. vii (1926-27) no. 8, p. 5-11.

Negro elementary and high schools. In Alabama and South Carolina a state supported high school offering a four-year course for Negroes is unknown. In other states Negro high schools are of a lower standard than those for whites. It has been estimated that in fifteen southern states only 9.5 percent of Negro children of high school age are enrolled.

It has been held, particularly by W. E. B. Du Bois, that educational discrimination against the Negro in the South is due to his political impotence. On the other hand, the white South insists that his elimination from politics is made necessary by his inadequate education. This elimination, successfully consummated by the 1890's, has not, however, prevented the Negro question from dominating southern politics. The Democratic one-party system exists for one reason only: the fear that bipartisanship would give the Negro the balance of political power, which in turn would mean the end of white supremacy. It is significant that when the "solid South" was broken by opposition to Smith in the presidential election of 1928, four of the six states which remained Democratic despite their hostility to the views of the candidate were those which had the largest proportion of Negroes in their population.

In recent years, when there have been pronounced factional differences within the Democratic party in certain southern communities, local politicians have wooed the Negro vote. But on the whole the principal objective of southern Democratic politicians has been to keep the Negro from voting. The few Negroes who actually do vote have been Republicans; in fact they constitute the backbone of such Republican organization as exists in the southern states. Recently Republican leaders desirous of building up the party in the south have been confronted with the fact that if this were to be accomplished the party would have to depend upon white votes, and that this in turn would involve stamping out the influence of the Negro. This "lily white" policy might have made headway had it not been that the northward migrations, which overnight made the Negro a potential force in politics in the great Republican stronghold of the east and middle west, forced the party to be cautious lest it antagonize these new voters.

When the migrants first went north, those who bothered about politics at all carried their Republican loyalties with them. In time, however, they were won over by local Democratic

machines, like Tammany Hall, working among these newcomers as they do among all population groups. Today thousands of Negroes in northern cities vote the Democratic ticket where they think it will do them most good. In general the Negro voters in the north act in much the same way as the white voters and align themselves with the dominant machine in their locality. The usual rewards—public offices, municipal, state and government jobs and political favors—have followed. In Chicago Negro voters have twice sent a Negro to Congress. Since 1917 Negroes have sat in the legislatures of many states including New York, Pennsylvania, Kansas, Michigan, Illinois, Missouri, New Jersey, Ohio and West Virginia and in the municipal councils of New York, Chicago and Baltimore. They have served on the bench in New York, Washington, D. C., and Chicago. It is impossible to determine the exact numerical strength of the black vote. Negroes of voting age constitute 9 percent of the total population of voting age in the United States. They constitute 26 percent of such population in the south and border states, 4 percent in the north and east and 5 percent in New York, Pennsylvania and Illinois.

The new power of the Negro in national politics was dramatically demonstrated by their part in the rejection by the United States Senate of John J. Parker for a seat in the Supreme Court of the United States. The Negro fight against Parker was led by the National Association for the Advancement of Colored People and helped considerably in arousing the Negro to a realization of his power as a political minority. Yet this victory was won not by a solid Negro vote but by the politicians' fear of such a vote, which in communities with the usual biparty system is more likely than a similar bloc among other racial minorities.

This unity of the Negro group is primarily the result of the insistence of the white world upon race separatism as the instrument through which white supremacy is to be maintained. The force of this demand weakens those caste or class distinctions which exist among the Negro population. Moreover the overwhelming majority of the Negroes are members of the working class; its middle class is small in number, weak in resources, only a few steps removed from the black wage earner and has almost no contacts with the white bourgeoisie.

The insistence upon white supremacy is based upon the doctrine of Negro inferiority, in sup-

port of which the white world adduces not only a host of stories and other homely illustrations but also cites the results of mental tests, measurements of various kinds and other "scientific" data. About fifty years ago some investigators went so far as to question whether the Negro could truly be considered a member of the human species. In various mental tests (*q.v.*) Negro groups have scored lower than whites. But detailed and careful analyses of army alpha and numerous other intelligence tests indicate that whatever the causes of divergence in mental scores—and education and economic opportunity seem to be important factors—race offers no clear cut explanation for them.

In addition to test data many other illustrations of the inferiority of Negroes are cited, such as the miserable character of their southern hovels, the crowded and unsanitary condition of the black city slums, the low state of the Negroes' health, their high death rate and the disproportionately high percentage of crime and delinquency among them. It should be apparent, however, that all these ills are the fruits of discrimination and lack of opportunity. In the field of public health, for instance, it has been estimated that there is 1 hospital bed for every 1941 Negroes as contrasted with 1 for every 139 whites. How large a role is played by unfavorable sanitary conditions and low economic status is shown by the extent to which tuberculosis is a cause of Negro mortality. In 1920 the death rate among Negroes from this disease was 202 per 100,000 as contrasted with 85.7 for whites. Yet in 1926 the facilities for sanitarium care for tuberculous Negroes amounted to only 4 percent of those available to white patients. Nevertheless, tuberculosis, which accounted for one fifth of Negro mortality in 1910, caused only one tenth of Negro deaths in 1920. Similarly Negro infant mortality, which has declined very rapidly in northern cities, is still almost double the rate for whites and eliminates about 10 percent of Negro children in the first year. The decline in the death rates from these two causes has been attributed to improved knowledge and care of health and to advancing economic status and increased leisure. In spite of such progress, however, the death rate of the Negro in 1930 was 15.6 per 1000 as contrasted with the white death rate of 10.8 and the general death rate of 11.3. According to Louis I. Dublin, "Negro death rates are higher in the city than in the country and hence, higher in the North than in the South," although the rate for southern cities

is higher than that for northern cities. This high death rate is not balanced by a proportionally higher birth rate. In 1930 the general birth rate was 18.9, the white 18.7 and the Negro 20.7.

The slower rate of increase of the Negro population, together with the influence of immigration, has tended to make the proportion of Negroes to the total population of the United States a declining one. In 1860 Negroes constituted 14.1 percent of the total population, in 1930 no more than 9.7 percent. On the basis of present population trends it has been estimated that in 1950 the Negro would account for 9.8 percent of the total population, which indicates that this declining proportion is not likely to continue. But whether the Negro population continues to decline or remains constant, the Negro problem in the United States will constitute an outstanding social question for some time to come.

In other parts of the western hemisphere modified forms of white rule have led to distinctions within the colored group, and the position of the Negro therefore assumes a more definitely class character than it does in the United States. In the British West Indies the ruling whites made such distinctions more than two centuries ago, and they have become deeply rooted in the social life of the islands. Mulattoes were granted special privileges, which were subsequently recognized in law by the Brown Privilege Act. Many mulattoes who were educated in England returned to play an important role in the local legislative bodies and formed the nucleus of a successful middle class of merchants, clerks, planters, ministers and, to some degree, other professionals. By custom such callings were closed to the black skinned man, who was consigned to mechanical and agricultural labor. West Indian society has thus become stratified in three layers: the whites, who constitute the governing and landowning class; the mulattoes, who constitute a middle class engaged in activities requiring no manual labor; and the blacks, who form the working class and peasantry.

While the West Indian black man is too far removed from the main streams of revolutionary thought to have acquired much proletarian consciousness, the West Indian mulatto has become a complete middle class individualist. The absence of racial barriers makes it possible for him to attain any reward which ability, energy, chance and the practise of the middle class virtues can bring. The more he looks out for him-

self and the less he identifies himself with the Negro masses, the greater are his chances of success. The West Indian mulattoes who have been outstanding in the leadership of the Negro people have been those who have emigrated to the United States and settled in New York and other large northern cities, where they have played a prominent role in all Negro movements of both a racial and a class character.

Prior to the emancipation of the slaves in 1834 the British West Indies were practically self-governing colonies. It was white fear of the power of Negro franchise, on the one hand, and the fear of London, on the other, that the local governments still in the hands of the old slaveholding classes might introduce a system of labor legally free but practically akin to slavery that led to the reorganization of the islands as crown colonies.

In Brazil also color lines tend to follow class lines, but with even fewer race distinctions. All colored groups, including Indians and a few pure Negroes, are represented in high political posts and are admitted to the most exclusive social circles. Inter-marriage was encouraged during the colonial regime as the only way in which Portugal could develop its Brazilian colonies. Members of the white slaveholding families, however, whose whiteness was a mark of their aristocratic status, refused to marry persons of darker skin. Although there is an attempt to maintain this position even today, economic stress has frequently caused exclusive families to ignore the color bar; and the average Brazilian is today a mixture of white, Indian and Negro strains. But the darker a person's skin the less likely he is to marry into a white family. The black man still constitutes the lowest class in Brazilian society, for he not only bears the mark of slavery but also continues to do the hardest and most unpleasant work of society. Certain individuals with black skins may climb out of their class to the highest positions in the land, but the mass of black skinned Brazilians continues as the most submerged element. They are only a minority of the population, however, and will continue to decrease, since the white element, including the so-called would be whites, is constantly adding to its numbers by European immigration.

Haiti is the one country in which the Negroes themselves overthrew their slave masters and founded a state of their own. Yet caste differences within Haitian black society are quite as pronounced as the caste differences between

Negroes and whites in the southern states of the United States. The Haitian élite—a wealthy and highly cultured group in the cities accounting for less than 5 percent of the population—looks down on the indescribably poor hill peasants.

Negroes and "dark mulattoes" form about a third of the Cuban population, constituting the lowest social caste. "Light mulattoes" are considered white. Differences between darker and lighter skinned persons affect only home and personal social relations, and such segregation as prevails in the United States is unknown. Negroes live and work where they please and occasionally hold high government and military posts. American companies, which have recently come to the island, have been attempting to import American segregation along with their capital. The United Fruit Company, in one of its sugar towns, has introduced a triple segregation under which American whites, Cubans and Negroes are compelled to live in different areas and are permitted to enter only those streets which are occupied by members of their own race. Recently the sugar companies, unable to get Cubans to work for the low wages they offered, began to import Negroes from Haiti and Jamaica. These French and English speaking black men form a group apart from the Cubans representing an influx of some 63,000 foreign Negroes in a population of less than 3,000,000. Many Cubans who had hoped that continued intermarriage would eventually weld all islanders into one group without race distinctions now fear that as a result of the activities of the sugar companies and the growing influence of Americans Cuba will have to face a real race problem.

NEIGHBORHOOD. The most distinctive characteristics of a neighborhood are its relation with a local area sufficiently compact to permit frequent and intimate association and the emergence out of such association of sufficient homogeneity and unity to permit a primary or face to face social grouping endowed with a strong sense of self-consciousness and capable of influencing the behavior of its several constituents. The neighborhood, which in early times was virtually identical with the village community, is in modern times also practically synonymous with crossroad and open country population groupings that have not yet attained the status of villages. The neighborhood is also to be found in towns and in cities, especially in residential areas which are not overdensely settled and which possess a population for the most part homogeneous and exhibiting a low rate of mobility. The characteristic processes of urbanization are, however, hostile to the preservation of neighborhood life in that they promote a high degree of population density, a low rate of per-

manency of residence and considerable heterogeneity of population. The existence in the city of an intricate network of secondary group associations also tends to break down the primary group spirit, which is the fulcrum of neighborhood life; as does also the ease with which the urban dweller may wrap himself in the cloak of anonymity and thus escape from the surveillance upon which primary group control depends.

With the breakdown of the neighborhood in cities there have grown up pseudo-neighborhoods that may be broadly defined as residential areas. Such areas exhibit some similarity to true neighborhoods in that they may show a considerable degree of homogeneity, especially when identified with particular racial or other ethnic groups, and also in that they operate in a large measure to condition the behavior of their residents. On the other hand, they are far too numerous populated to present anything remotely resembling the close knit primary group community life characteristic of the generic neighborhood; such uniformities of conduct and attitudes as they display may more accurately be described as products of sectionalized culture patterns. Another type of pseudo-neighborhood is that associated with the settlement houses or community centers to be found in many contemporary American and European cities. Such social structures represent deliberate attempts to preserve or restore some of the features of neighborhood life. Where ably led, long established and fortunately situated such enterprises achieve a degree of cohesion and social significance. They fall short of being true neighborhoods, however, not only in that their leadership and financial support are usually exogenous to the areas that they serve but also in that their constituencies are not inclusive or even representative vicinage groups but are rather selected special interest groups or clusters of such groups. A close approach to the redintegration of the neighborhood often arises in the modern city when organization takes place on the basis of locality plus special interest: for example, business men's associations; health councils, as in the Cincinnati Social Unit plan; and local improvement associations, as in Washington, D. C. A short lived recrudescence of neighborliness may also attend a sudden crisis or emergency, such as a conflagration or the invasion of an established residential area by an institution or ethnic group regarded as undesirable.

Residential areas situated in suburbs or in the quasi-suburbs of the urban fringe approach

even closer to the generic neighborhood type in that their populations are relatively homogeneous and permanent and are sufficiently sparsely settled to make possible a considerable range of personal acquaintance. The absence of most of their employed population during the greater part of the day, however, together with the ease of escape from the restrictions of primary group control prevents such areas from functioning as well integrated neighborhoods. Intermediate between the suburban and rural neighborhoods are those associated with the week end and holiday residences maintained in the outer periphery of the larger metropolitan areas of the United States and Europe by an increasingly large number of individuals.

Although shorn of much of their exclusive self-sufficiency by modern instrumentalities of transportation and communication the rural and small town neighborhoods continue to exhibit all the essentials of the generic type. The economic and biological impoverishment of many rural areas, however, often leaves such neighborhoods without much of the vitality and effectiveness which they formerly possessed.

NELSON, LEONARD (1882-1927), German philosopher. Nelson was the son of a Berlin lawyer. During his early student days he became an enthusiast for the philosophy of Fries and retained this enthusiasm throughout his philosophic career. At Göttingen, where he began to teach in 1909, he revived the Friesian version of Kantianism, according to which the fundamental a priori condition of knowledge is the self-confidence of reason in sound human understanding. Every man has an immediate, if obscure, knowledge of first principles and constantly uses this knowledge in practise. The function of critical philosophy is to clarify these

psychologically immanent principles by self-observation. Nelson attacked the transcendentalist Kantians for seeking a logically impossible guaranty of knowledge in transcendental principles which themselves can have no greater validity than the sciences from which they are inferred. The neo-Friesian, psychological view of the *a priori* has influenced not only Nelson's immediate school but relatively independent thinkers like Rudolf Otto and Wilhelm Bousset in the study of religion and O. Meyerhof and A. Kronfeld in psychiatry.

Nelson's own initial interest lay chiefly in mathematics and natural science, but the World War drew his attention to the problems of ethics, jurisprudence and political education, to which he henceforth devoted all his energies. A rational ethics involved for him a calculation of interests in accordance with the immanent first principle of the equal moral worth of every person. In other words, interests were to be compared objectively, irrespective of whose interests they were. Rational jurisprudence was the science of justice, that is to say, of those social conditions which will provide every person with equal external opportunities for attaining self-determination, cultivation and spiritual freedom. Nelson assailed all jurisprudence which bases itself on the special rights established in the social status quo as a *Rechtswissenschaft ohne Recht*, and in his last main work elaborated an alternative system predicated on radical political and social reforms. His interest finally centered upon a political education to prepare men for this work of reform.

He established the Internationaler Jugend-Bund and a small international school at Walke-mühle near Cassel, where his principles of pacifism, social justice and personal integrity were the guiding inspiration. In 1923 the members of the Bund decided to cooperate with the Social Democratic party, but a break came in 1925 as Nelson disapproved of the party's alliance with the Catholic Centrists, of its condoning cooperation between employers and workers and of its reliance on parliamentary majorities instead of on leaders trained in the science of social justice. The Bund became the Internationaler Sozialistischer Kampf-Bund and Nelson moved further to the proletarian left without, however, identifying himself with the Communists. His economic views he shared in large measure with Franz Oppenheimer, but on the whole he was in his practical efforts an isolated figure, evoking intense loyalty in a small group

of followers by his self-consistency, self-discipline and radical reforming zeal.

NERI, SAINT PHILIP (1515-95), founder of the Congregation of the Oratory. Philip, the son of a notary, spent his early years among the youth of Renaissance Florence; to their spirit his characteristic gaiety is largely due. From Florence and especially from Savonarola's convent of San Marco he inherited also his democratic principles and his dread of absolute government. In 1532 or 1533 he went to Rome, where he associated himself with the reform movement then beginning to manifest itself, particularly in work and preaching among the masses. In 1548 he took the first step toward community life by helping to form a society of twelve, the Trinità de' Pellegrini, established primarily for prayer, secondarily for the needs of pilgrims and the poor. His apostolate really began with his ordination as priest in 1551, when he took up quarters in the great charitable institute of San Girolamo della Carità.

The original nucleus of the Congregation of the Oratory was the group of penitents, chiefly young Tuscans, who gathered around Philip and who about 1554 began to hold discussions

in a room of San Girolamo known as the Oratory. As it gradually developed into a center for artists and professional men and courtiers, the Oratory came to stand for a method of spiritualization, fulfilling a function similar to the *Spiritual Exercises* of St. Ignatius of Loyola but differing from them in that it was a spontaneous discipline working through social contagion rather than a logically planned system for individual regeneration. The informality of the meetings, which were at first conducted chiefly through lay preachers, met with some disapproval under Paul IV and Pius V; but under Pius IV the Oratory became recognized as "the outstanding instrument for the regeneration of Rome." In the slow process of consolidation marked first by the emergence of an inner circle of devotees sharing the charitable activities of Philip's life, then by the formation of a community associated with the Church of St. John of the Florentines and later removed to the Vallicella, Philip consistently labored to protect the independence of his followers, as in all his acts he zealously guarded his own. When the Congregation was finally established by a papal bull in 1575, it represented an institutional innovation, having no vows and no other status than that of the secular clergy; for such an organization the only precedent was a community of women established more than a century before by St. Frances of Rome. Although nominally governed by a provost—an office which Philip assumed in 1577—the Congregation, in sharp contrast to the Jesuit organization, was extremely democratic and all proposed laws were not only freely discussed by the entire membership but required the sanction of the majority. The definitive constitutions, the promulgation of which was delayed until 1612, largely because of the demands of the Neapolitan house for a more conventional status, scaled these empirical developments, preserving the freedom from vows and the complete autonomy of each house.

The work of Philip Neri was one of the main forces in the Counter-Reformation. His part in the internal reform of the Catholic church was unplanned: it came as the inevitable result of his influence and of the instrument—the Oratory—which he almost unintentionally fashioned. Beginning with the Curia in Rome the reform, aided by the rapid rise of oratories in various countries in Europe, spread to the clergy and thence to the church as a whole. The Christian people were given a piety that was simple,

accessible and unpretentious, thus preparing the way for the work of a great kindred spirit of St. Philip—St. Francis of Sales.

A. MANSON

Consult: Ponnelle, Louis, and Bordet, Louis, *Saint Philippe Néri et la société de son temps* (Paris 1929), tr. by R. F. Kerr (London 1932), with bibliography; Pastor, Ludwig von, *Charakterbilder katholischer Reformatoren des XVI. Jahrhunderts* (Freiburg i. Br. 1924) p. 79-104.

NERI, POMPEO (1706-76), Tuscan economist and statesman. After receiving his degree in jurisprudence Neri became a professor of public law first at the University of Pisa and later at the Studio Fiorentino. In 1735 he entered the Tuscan public service and became interested in projects designed to aid agriculture; to this end he reclaimed marshlands and drafted a law limiting entails. In addition he helped formulate legislation intended to reduce the inalienable and badly cultivated lands of the church. Neri was engaged in the preparation of a unique Tuscan code to be based upon the norms of laws scattered in ancient texts when he was appointed in 1749 to complete the land register of Lombardy. The chief merit of this census, which was later used as a model, was the establishment of the principles that taxes should be based upon land value, that future improvements of land should be tax exempt, that many exemptions should be abolished and that administration should be organized rationally. Many of these rules had already been stated, however, by Charles VI's commission.

In 1757 Neri returned to Tuscany, where he became a councilor and subsequently president of the Council of the Regency. He had previously interested Grand Duke Francis II in Bandini's proposal for free trade in grain, until that time considered chimerical. During the famine years 1763-64 he induced Francis, against the opposition of all the vested interests, to permit the unlimited import of grain, duty free. This was a step toward the establishment of permanent free trade in foodstuffs, concerning which Neri wrote his famous *Memoria sopra la materia frumentaria* (Milan 1767; reprinted in the Custodi collection, parte moderna, vol. xlix, 1803); he argued that Tuscany's future lay not in its manufactures but in its agricultural resources and that unrestricted commerce in grain would furnish the greatest impetus to their development, while regulation would limit the value of agricultural produce and lead to decreased production. Neri finally

achieved his purpose in 1767 when all internal and external restrictions on the grain trade were abolished and Tuscany became the first country in Europe to experience the advantages of the new system. In the projects for the reclamation of the Siennese Maremma, Neri again urged that agriculture be freed of all fetters. His name is connected also with the administrative reform of the municipalities.

NEUMANN, FRIEDRICH JULIUS (1835-1910), German economist. Neumann was at first active in the Prussian civil service but soon turned to an academic career, which took him from Königsberg to Basel, then to Freiburg and in 1876 to Tübingen. He belonged to the group of economists who, although fully aware of the significance of historical data, insisted nevertheless that the essence of economic inquiry lay in systematic interpretation rather than in mere accumulation of factual material. His penchant for abstract thinking was inherited from his father, Franz Neumann, the founder of mathematical physics, while his preference for problems of terminology is traceable to his excellent legal training. In his works, which are distinguished for acute analysis of fundamental principles in economic theory, he was particularly concerned with the clarification of economic concepts and problems of methodology. He distinguished sharply between natural and socio-economic phenomena and pointed to the intimate connection between economics and other social disciplines, particularly public law.

Of greater significance was his work in public finance, to which he devoted several monographs. With Adolf Wagner he elaborated the social approach to fiscal science in that he made public interest the basis of public finance. No other scholar influenced tax legislation as much as did Neumann; Germany's transition from the system of taxes in rem to the modern system of personal taxation is directly traceable to the influence of his works.

Neumann also edited the *Beiträge zur Geschichte der Bevölkerung in Deutschland seit dem Anfange des XIX. Jahrhunderts*, 7 vols. (Tübingen 1883-1903).

NEUTRALITY. The modern legal status of neutrality implies the impartiality of one state toward two or more belligerent states. During the early Middle Ages this status of neutrality was unknown; feudal obligations, ties of the empire and theories of the solidarity of Christendom militated against the adoption of such a concept. As the bonds of the empire dissolved and strong national states emerged, states found themselves free to refrain from interfering in their neighbors' quarrels and at times found it advantageous to do so. By the sixteenth century the word *neutre* was in use to describe territory accorded a position of immunity from attack and also to characterize an impartial prince who might hold territory in pledge. Well into the eighteenth century, however, "friend" was used interchangeably with "neuter" or "neutral."

In the sixteenth and seventeenth centuries the idea of impartiality was not pressed to extremes. A neuter was merely a state not participating fully in the conflict on either side. At the same time the neuter might aid one side or the other by permitting passage of troops, by allowing mercenaries to be recruited within its borders or more actively by supplying men, money or other tangible forms of assistance. As the concept developed, it came to be understood that unless such assistance were furnished in fulfillment of a prior treaty obligation, the neuter might forfeit his position. Nevertheless, levying of troops in neutral countries and furnishing money and arms were common down through the seventeenth century and the practise survived even to later times.

Neutrality in land warfare necessarily differed from neutrality in maritime warfare. Although the underlying principles were the same, the particular rules which developed had little in common. Undoubtedly the law of neutrality developed chiefly in the maritime field, as a result of the rapid increase in European sea borne trade after the end of the fifteenth century. There were, as there are today, detailed

problems of neutrality on land; but far more important were those which always arise in the field of the great maritime trade. A clash of interests was inevitable: the neutral desired to continue trade unhampered by belligerent activities; the belligerent wished to interfere with the enemy's commerce, even at the expense of the neutral. Both groups frequently sought to take advantage of the war to increase their own trade. As a result of practical necessity therefore rules were gradually developed to compromise between these conflicting claims. Belligerents agreed that neutrals might in general continue to trade, even with the other belligerent; neutrals agreed to certain interferences or restrictions.

Probably the earliest accepted restriction on neutral trade related to enemy property. The *Consolato del mare* as early as 1494 registered a well developed practise on this subject. Nevertheless, conflicting interests led to diverse national attitudes, not finally reconciled until the signature of the Declaration of Paris in 1856, which embodied the rules, free ships free goods and free goods free even in enemy ships.

As early as the twelfth century belligerent states endeavored to enforce sweeping bans upon all commerce with an enemy, but neutrals did not acquiesce in such claims. The claims gradually simmered down, on the one hand, to the law of contraband of war—prohibition against trading in certain commodities—and, on the other hand, to the law of blockade—prohibition against trading with certain places which were besieged, invested or blocked up. There also gradually developed a category of acts described as unneutral service, which includes the carrying of military persons, dispatches and the like. This category is the basis for such rules as the Rule of the War of 1756, which forbade a neutral in time of war to engage in commerce that might prove helpful to a belligerent and that would be closed to the neutral in time of peace, as, for example, the colonial trade. The neutral which carried contraband, ran a blockade or performed unneutral service ran the risk of losing ship and cargo if captured by a belligerent and found guilty by a prize court. There was general agreement upon such detailed rules as these but not upon the broad principle that a belligerent might shut off anything possibly useful to the enemy in the war.

Although as early as the sixteenth century the customary law of nations was invoked in diplomatic correspondence, the law of neutrality was formed chiefly by treaties of the seventeenth and

eighteenth centuries. Since the legal rights and obligations of a neutral were but vaguely understood, governments sought precision in written undertakings. Through the middle of the seventeenth century these conventional obligations of neutrality took three forms: undertakings that the state when neutral would not itself aid the enemy of either party, except perhaps in pursuance of a prior treaty obligation; undertakings that the state would not permit its citizens or inhabitants to aid the enemy of either party; undertakings which merely note that a citizen who aids a belligerent must take the consequences and will not be protected by his own government from the penalties which the aggrieved belligerent may inflict. The conventional rights of neutrality obtained were the rather nebulous agreement to respect neutrality and stipulations regarding freedom of neutral trade at sea.

Prize courts, which were functioning in the principal maritime countries under clearly established rules of procedure as early as the middle of the sixteenth century, demonstrated how much reliance was placed upon treaties but at the same time contributed to the development of a body of customary law.

Although it is easy to exaggerate the influence of writers upon a subject like neutrality, the significance of their contribution must not be overlooked. Their books tended to strengthen infant practises and at times may have adumbrated the course of future progress. Grotius was cited in a brief before a French prize court as early as 1653, and other pleadings of the seventeenth and eighteenth centuries as well as state papers show familiarity with and reliance upon him and upon other writers. Grotius had little to say on neutrality. He calls neutrals *in bello medii* and says that although the neutral should favor the just side, in doubtful cases he should treat both sides alike—not necessarily to abstain from all aid to either, but if giving aid, to give it to both impartially. Gentili, who had practical experience in defending Spanish interests in prize cases in the early seventeenth century, had a clear notion of the territorial rights of neutrals and dealt in highly modern fashion with neutral rights at sea. One hundred years after Grotius, Bynkershoek still maintained that the neutral state (*non hostis*) fulfils its duties if it serves both sides with impartiality. Vattel was the first clearly to describe in detail the modern concept of neutrality. He expressly rejected the idea of equal aid to both sides, assert-

ing the modern duty to refrain from aid to either. Vattel recognized, however, that aid might be furnished to one side in compliance with a prior treaty obligation. Hubner vigorously defended the rights of neutral trade against belligerent interferences.

During this early formative period the emphasis was chiefly upon neutral rights rather than upon neutral duties, except as the latter were specifically imposed by particular treaty stipulations. There are numerous instances in the seventeenth century which show a consciousness of the idea that neutral territory must be respected by a belligerent, but little suggestion that a neutral was obliged to enforce such respect. As early as 1562 Elizabeth stated on this subject that "the territory of an indifferent and meane prince is sauf conduite in lawe." Thus the neutrality policy of the United States under Washington marks a highly significant landmark in the history of neutrality. The United States insisted that the European nations should respect its neutrality while in return it would fulfil the duties of neutrality. By this it meant that it would accept responsibility to an aggrieved belligerent for damage inflicted by its enemy within American territory. In view particularly of the activities of Citizen Genet during this period in commissioning privateers and setting up prize courts within the jurisdiction of the United States, this was no light undertaking. Embargo and non-intercourse acts were passed by the United States to bring pressure upon the European belligerents to respect its neutral rights. After the wars the United States settled claims with both England and France. To England under one of the Jay Treaty arbitrations the United States paid a little less than \$150,000 in satisfaction of damages caused by breaches of neutral duties, while England paid to the United States over \$11,500,000 for damages caused by infringements upon neutral rights. This American payment was a precedent for the famous Geneva arbitration of the *Alabama* claims after the Civil War, under which Great Britain paid the United States \$15,500,000.

In Europe under the leadership of Russia the northern neutrals banded together in the armed neutralities of 1780 and 1800, for which there was an early precedent in the treaty of 1613 between the Dutch States General and Lübeck, accepted by Sweden in 1614. These armed neutralities were important because they added weight to certain specific rules, but their influence was short lived. As a precedent for joint

action by neutrals in defense of their rights they were singularly ineffective.

The Napoleonic wars demonstrated that in any vast and vital conflict rights of neutrals would suffer. This was not a new lesson; it had been taught frequently in the seventeenth century, notably in the Anglo-Dutch wars against France. All such struggles are also contests for economic mastery. Economic weapons are employed with the post-war economic situation kept definitely in mind. Belligerent rights are utilized in an endeavor to prevent neutrals from capturing new markets or more of the world's carrying trade, while neutrals have their own strategy for protecting and improving their positions. With the usual excuse of each that its actions were justified by the illegal acts of the enemy, the British government and Napoleon issued a series of orders and decrees, which were highly injurious to neutral trade. The slowly developed laws of blockade and contraband were swept aside in a return to the ancient pretensions of a right to ban all commerce with the enemy. Neutral protests were not very successful, nor were such retaliatory measures as those adopted by the United States. As a logical argument, however, nothing excelled Jefferson's defense of neutral rights which centered on the theme that although England might have a right to starve France, she had no right to make the United States the instrument to effect her purpose.

In the Napoleonic wars as in other wars before and since belligerents have had to consider that if established neutral rights were too flagrantly violated, the neutral might be drawn into the conflict on the enemy's side.

During the century following the Napoleonic wars neutrality had a less eventful career because of the absence of major conflicts. Each war, however, added its store of precedents to build up the legal structure. The Crimean War resulted in the Declaration of Paris of 1856, which among other achievements crystallized the law of blockade and declared privateering abolished. The Civil War contributed the rules of the Treaty of Washington of 1871, which stipulated that a neutral must use due diligence to prevent evasion of its laws for enforcing neutral duties. This standard of "due diligence" was altered at the Second Hague Conference to require the neutral to use "the means at its disposal." In the prize decisions of the United States Supreme Court the foundations were elaborated for the doctrine of "continuous voy-

age," which was to be pressed in the World War to the point of practical extinction of neutral rights. The Boer War led to Lord Salisbury's famous definition of goods conditionally contraband and thus supported the neutral cause. Since the neutrals were strong in the Russo-Japanese War, neutral rights were vigorously maintained during that struggle.

In the First and the Second Hague Peace Conference of 1899 and 1907 respectively neutral rights and duties in their modern form received elaborate formulation, although crucial matters such as contraband and blockade were untouched. The attempt at the Second Hague Conference to create an international prize court led to the London conference of 1909, at which all the important points of prize law were codified in the Declaration of London. Although it was never ratified by its signatories, its influence as a statement of rules and principles was great.

When the World War broke out, the law of neutrality was based upon some three centuries of practice, upon hundreds of decisions of prize courts and upon important international instruments. But more significant were the essentially conflicting political and economic realities of which the law of neutrality registered the adjustment. Under the modern law of neutrality, in general a neutral is under a double duty: not itself to aid either belligerent and to prevent its citizens from performing certain but not all acts in aid of a belligerent. More specifically, according to the 1907 Hague Convention respecting the Rights and Duties of Neutral Powers and Persons in Case of War on Land and other recognized principles concerning land warfare the rules which follow are generally accepted. Neutral territory, including the air space above, is inviolable. Belligerents may not move troops or war supplies in transit across neutral territory. They may not set up or use for military purposes wireless stations on neutral territory. Combatant forces cannot be recruited on neutral territory. Neutrals are under a duty to prevent activities forbidden to a belligerent. The neutral is not required to restrain private individuals from crossing the frontier to serve a belligerent, from shipping arms, munitions and other contraband goods or from utilizing private telegraph and wireless facilities on behalf of belligerents. If belligerent troops enter neutral territory, they must be interned for the duration of the war. If sick and wounded are brought in, the neutral must insure their not participating again in military operations.

In regard to maritime warfare the 1907 Hague Convention concerning the Rights and Duties of Neutral Powers in Naval War is applicable. No belligerent act is to be performed in neutral territory or in neutral waters. A prize captured in neutral waters must be released by the neutral if it has the power, otherwise by the captor on demand of the neutral. Prize courts may not be established in neutral territory nor may belligerents use such territory as a base of naval operations. The neutral government may not supply a belligerent with warships, ammunition or war material but need not prevent private exports of munitions; it must use the means at its disposal to prevent the departure, fitting out or arming within its jurisdiction of any vessel destined for hostile operations. Belligerent war vessels and prizes may pass through territorial waters, but warships may not remain in port more than twenty-four hours except in special cases. They may take on in case of need a limited amount of provisions but may not increase their armament or fighting force; nevertheless, they may make repairs sufficient to render them seaworthy. The Hague convention allows neutrals to choose between allowing warships sufficient fuel to reach the nearest port of their own country and permitting them to fill their ordinary bunkers, but no warship may refuel in a port of the same neutral within three months. Belligerents may not store prizes in neutral ports; the neutral must release those which do not leave when ordered. A neutral may, however, allow prizes to be sequestered in its ports pending decision of a prize court; this article of the Hague convention was not accepted by the United States, Great Britain, Japan and Siam. When warships of two belligerents are in the same neutral port, twenty-four hours must intervene between their departures. Warships which do not leave when required are interned by the neutral together with their officers and crews.

In each state neutral duties are enforced through the appropriate form of local control. On the outbreak of war it is customary for neutrals to issue proclamations of neutrality. These usually warn the nationals of their state against unneutral acts. When nationals are guilty of unneutral acts they will not be assisted by their governments if the belligerent penalizes them. If the act is one that the neutral state is bound to prevent, it usually punishes the offender. The neutrality laws of the United States, which with various amendments date from 1794, cover in general the international obligations of

the United States as a neutral and also go further in dealing with aid to insurrectionists in countries with which the United States is at peace. The president may declare an embargo on arms and war material addressed to any American country with which the United States is at peace when it appears that the export of such materials is encouraging insurrection.

The World War again put neutrality to the test. Until the United States became a belligerent, the weight of neutral influence was a powerful factor. The United States government, however, did not defend its position as vigorously as it had in the Napoleonic period. European neutrals made their bargains with each side as best they could and with varying success. Almost from the outset, with one obvious purpose but with varying justifications, the belligerents made nugatory the legal freedom of neutral trade. Nevertheless, the economic necessities of the situation demanded neutral commerce. Both Allied and Central Powers proceeded to control the situation by extralegal means. In addition to exercising their naval power to intercept neutral ships at sea both sides used economic and financial pressure to secure desired action by the neutrals. The British government refused bunker supplies to neutral ships which would not accept sailing orders or which traded with firms on the "blacklist." In some cases tonnage was requisitioned. Embargoes, specific and general, were placed on the European neutrals until those governments yielded to belligerent demands. A striking example is the British action in cutting Holland off from all oversea telegraph and cable services until it agreed to stop the transit of Belgian gravel bound for Germany. In most of the neutral countries trade organizations were set up to handle in a manner satisfactory to the Allies consignments of oversea shipments; some of these trade organizations were under government auspices or control, others privately operated. The best known was the Netherlands Overseas Trust. The Central Powers made similar bargains and commodities were bartered with the neutrals under the system known as "Kompensationsverkehr." After the United States entered the war, the allied control of the neutrals was practically complete. Many of them were rationed and compelled to adapt their economy completely to allied convenience.

It was commonly asserted that conditions had so changed that the old rules had also changed. These wartime utterances, however, do not rep-

resent views now advanced by the governments of the world. Their soundness has been convincingly challenged by John Bassett Moore (*International Law and Some Current Illusions*, New York 1924), but other writers have argued regarding the extent to which the old rules have survived the conflict. It is notable, however, that the changes are alleged to have taken place more in the field of neutral rights than in the field of neutral duties. On the whole neutral duties were strictly enforced during the war, and the violations of neutral rights were chiefly those which occurred on the high seas.

The post-war situation which has developed as a result of the creation of the League of Nations and more recently because of the general acceptance of the Pact of Paris has led to much discussion as to whether neutrality has any place in the modern world. Tangible evidence of its survival is found in the elaborate Convention on Maritime Neutrality adopted at the Sixth International Conference of American States at Havana in 1928 and since ratified by five states, and in the "neutrality treaties" concluded by several members of the League of Nations and expressly referred to in the negotiations leading up to the signature of the Pact of Paris. It seems evident also that because of the famous gap in the Covenant it is legally possible even for members of the League to be neutral in some wars. It may well be argued that in the present or future condition of world solidarity, neutrality is an antisocial status. It remains true, however, that no international agreement has definitely put an end to the law of neutrality and except for specific treaty provisions, such as those in the Covenant of the League, states may in time of war still claim neutral rights and be called upon to fulfil neutral duties.

NEUTRALIZATION signifies a regime in which a state or area is "of neither party to a war"; the term has been applied loosely to states, international waterways, canals, etc. The development of the idea of neutralization followed the more general acceptance of the principles of neutrality. Such qualifying words as positive or negative, permanent or temporary, guaranteed or not guaranteed, voluntary or imposed, limited or unlimited, show the range of use of the concept of neutralization. The phrase "perpetual neutrality" as an equivalent to neutralization came to mean in practise merely neutralization undetermined as to time. Neutralization has been used sometimes to imply obligations on the part of the neutralized state to maintain neutrality and sometimes to imply obligations on the part of the other parties to the agreement to defend the neutralization. Neutralized states, unless demilitarized, are accorded the right to arm or to make alliances for defense. When territory is added to a neutralized state, the status of neutralization does not ipso facto extend to that area.

Neutralization, or the establishment of perpetual neutrality, is to be differentiated from neutrality policies as evidenced in a unilateral declaration or in the usual attitude of a given state in time of war; the United States, for example, has usually been neutral in periods of war, although there has been no neutralization or legal obligation to follow such a policy. Neutralization should also be distinguished from demilitarization, either partial or complete. Demilitarization, although it may be related to neutralization, implies only an absence of or limitation on the means of war, while neutralization would bar a state of war. Thus demilitarization is the status of the archipelago of Spitsbergen, which under the general treaty of 1920, acknowledging Norwegian sovereignty, "may never be used for warlike purposes" (art. 9). Demilitarization may be qualified, as in the Washington treaty of 1922 limiting the "fortifications and naval bases" in certain areas of the

Pacific Ocean to the status quo at the time of the signing of the treaty (art. XIX); this does not necessarily imply, however, that these areas will be neutral in time of war in which any of the parties may be engaged. The status of demilitarization of the Åland Islands, under the convention of March 30, 1856, was reaffirmed by article 3 of the convention of October 20, 1921, relative to the non-fortification and neutralization of the islands. The signatories may on recommendation of the Council of the League of Nations act to secure respect for the neutrality of the islands. Neutralization should also be distinguished from internationalization. Canals have been subject to international agreements; for example, the Suez Canal "shall always be free and open, in time of war as in time of peace, to every vessel of commerce or of war without distinction of flag." While the status of the Suez, Panama and Kiel canals is not identical, they are all regarded as in a sense internationalized.

The most frequently mentioned example of neutralization is Switzerland. After the treaty of 1291 there was a gradual building up of the union of Swiss states, aiming at freedom and independence, often shrewdly maintained by neutrality during European wars. Switzerland's independence and neutrality were recognized in the Peace of Westphalia (1648), and European alliances and the balance of power system during the eighteenth century inclined leading states to favor Swiss neutrality. Foreign troops, however, entered Switzerland after the battle of Leipsic in 1813 without opposition on the part of Swiss forces and for a time Switzerland, unable to defend its neutrality, was a football in European politics. The declaration of Austria, Spain, France, Great Britain, Portugal, Prussia, Russia and Sweden, March 20, 1815, stated "that the general interest demands that the Helvetic states should enjoy the benefit of a perpetual neutrality" and arranged for the guaranty of this status upon the acceptance of certain stipulations by the Helvetic Diet. The diet acceded to the stipulations and the declaration was confirmed by the Treaty of Vienna, June 9, 1815. In the act of November 20, 1815, "The powers who signed the declaration of Vienna of March 20 declare, by this present act, their formal and authentic acknowledgment of the perpetual neutrality of Switzerland; and they guarantee to that country the integrity and inviolability of its territory in its new limits." At the same time a similar status was accorded to parts of Savoy.

The guaranty of neutrality by the act of November 20, 1815, has been denied by some on the ground that perpetual neutrality was only acknowledged, while the integrity and the inviolability of Swiss territory were guaranteed. Some political leaders did not consider the guaranty as imposing positive obligations; Lord Stanley said, "We should hardly feel bound to go to war with all the world for the protection of Switzerland." While undoubtedly treaty provisions in regard to perpetual neutrality have given a degree of security to areas under such treaties, events have shown the wisdom of insuring physical support for the agreements. This Switzerland has had and has threatened to use, as in the declaration of neutrality in 1859, which was subsequently reaffirmed, even in 1914. In 1871 after the siege of Belfort the French army retreating into Switzerland was interned there and not allowed to cross. On the other hand, the mere verbal guaranty as provided in the treaty of 1815 which declared Cracow and its territory "forever a free, independent and strictly neutral city, under the protection of Austria, Russia and Prussia," was found inadequate when, in spite of protests from Great Britain and France, Cracow was absorbed by Austria in 1846.

That Belgium should form "an independent and perpetually neutral state" was provided for in article 7 of the treaty of November 15, 1831, between Austria, France, Great Britain, Prussia, Russia and Belgium, relative to the separation of Belgium from Holland. A protocol of December 20, 1830, referring to Belgium had mentioned as one of the reasons for the policy of the powers "the maintenance of the balance of Europe." As early as January, 1832, however, it was officially stated "that neutrality did not give to Belgium any more than to any other state a right to fall short in the obligations which flow from treaties," and it was not at all certain that its neutrality would be respected. That this doubt existed became evident in the Franco-Prussian War (1870-71), when by the treaty of August 9, 1870, Great Britain promised armed cooperation to Prussia in case of violation of the neutrality of Belgium by France, while a similar treaty of August 11, 1870, provided for cooperation with France in case Prussia violated Belgian neutrality. The neutrality of Belgium was respected, however, by both parties during this conflict and remained secure until 1914, when Belgian territory was invaded by Germany and the neutralization treaty was on August 4 termed by Bethmann Hollweg a "scrap of paper."

Later he explained that he had meant that for England the Belgian treaty had "only the value of a scrap of paper."

The neutralized status of other territories was also disregarded during the World War. The Grand Duchy of Luxemburg had in 1815 been allocated to Holland, and the king as grand duke had placed Luxemburg under the protection of a number of the powers. Later agreements reaffirmed its status. By a treaty of May 11, 1867, the neutrality of Luxemburg was "placed under the sanction of the collective guarantee of the powers, signing parties to the present treaty, with the exception of Belgium, which is itself a neutral state." By article III the city of Luxemburg was to "cease to be a fortified city" and by article V the fortress was to be demolished. In reply to questions in the House of Commons Lord Stanley, who had negotiated the treaty, said, "Such a guarantee has obviously rather the character of a moral sanction to the arrangements which it defends than that of a contingent liability to make war. It would, no doubt, give a right to make war, but it would not necessarily impose the obligation." In 1914 armed forces entered Luxemburg. It was supposed that the General Act of the Conference of Berlin, 1885, would secure perpetual neutrality to the Congo region, but in the World War the belligerents under reciprocal recriminations held the clauses invalid. Corfu and Paxos and their dependencies were by the treaty of March, 1864, to "enjoy the advantages of perpetual neutrality." Nevertheless, in 1915 Corfu was occupied by the Allies, Serbian troops being placed there.

Following the World War the status of some of the neutralized territories was changed by treaty. In 1919 the provisions of the General Act of Berlin relative to the neutrality of the Congo were abrogated (Convention of Saint-Germain-en-Laye, art. 13). By the Treaty of Versailles, which became operative in 1920, Germany recognized that as to Belgium the treaties of 1839 "no longer conform to the requirements of the situation" and were to be replaced (art. 31); and as to Luxemburg, Germany adhered "to the termination of the regime of neutrality" (art. 40). The neutralized sections of upper Savoy were also deneutralized (art. 435 and Annex).

There have been other less famous instances of neutralization. Thus the lighthouse of Cape Spartel in 1865 was placed under an international agreement for its security for renewable periods of ten years by convention between

Morocco and the principal naval powers. Morocco was to furnish a guard "of a Kaid and four soldiers" and "the contracting Powers bind themselves, each so far as concerned, to respect the neutrality of the lighthouse," even in case of war (14 U. S. Stat., 1865-67, p. 680). Later, in 1892, an agreement provided for the erection and maintenance of a semaphore.

Treaties have provided for various degrees of neutrality in differing phraseology open to differing interpretation. Under article xxxv of the treaty of 1846 relating in part to the Isthmus of Panama "... the United States guarantee, positively and efficaciously, to New Granada (Colombia), by the present stipulation, the perfect neutrality of the before-mentioned isthmus, with the view that the free transit from the one to the other sea may not be interrupted or embarrassed in any future time while this treaty exists; and, in consequence, the United States also guarantee, in the same manner, the rights of sovereignty and property which New Granada has and possesses over the said territory." Nevertheless, the United States recognized the Republic of Panama in 1903, and by treaty with Panama acquired in perpetuity within a ten-mile canal zone the exercise of sovereign rights.

The term neutralized has also been employed from time to time as a "euphemism," as Thomas Erskine Holland described its use in connection with the Peace of Paris of 1856, which provided that "the Black Sea is neutralized." The employment of this expression was presumed to make more palatable to Russia the restriction upon the exercise of its sovereign rights. By the treaty of March, 1871, this article was specifically abrogated.

During the nineteenth century neutralization treaties aimed to set up conditions which would bring about results similar to those sought in the eighteenth century by balance of power arrangements. The Covenant of the League of Nations, 1919, if effective, would by article 10 and other articles make many of the nineteenth century neutralization agreements unnecessary. Article 10 declares: "The Members of the League undertake to respect and preserve as against external aggression the territorial integrity and existing political independence of all Members of the League."

NEW HARMONY. See COMMUNISTIC SETTLEMENTS; OWEN AND OWENISM.

NEWMAN, CARDINAL JOHN HENRY (1801-90), English theologian. Newman was born in London and was graduated from Trinity College, Oxford, in 1820. From then until shortly after he renounced Anglicanism in 1845 for adherence to the church of Rome, Newman was connected with that university, first as fellow at Oriel, then as tutor and for almost twenty years as vicar of St. Mary's. After his ordination at Rome as a priest of the Catholic church Newman returned with a commission from Pius IX to introduce in England the institute of the Oratory, and eventually he founded oratories at Birmingham and London. He spent the four years from 1854 to 1858 as rector of the newly established Catholic University of Ireland at Dublin and the remainder of his long life in religious and educational activities in England. In 1879 he was created a cardinal by Leo XIII.

It is doubtful if any individual had more influence upon the religious life of nineteenth century England than Newman. With John Keble, R. H. Froude and others he originated the Oxford movement and Newman himself wrote the first of the *Tracts for the Times*. An aggressive and stirring protest against Low Church and Broad Church Anglicanism, the Oxford movement sought to instil a new spirit

in the High Church group and to give that party a platform and an objective. In its broader significance the movement was symbolic of the antidemocratic reaction precipitated by the radical movements of the reform era, particularly as they had affected the English church through the Catholic Emancipation Bill and other legislation. Newman was essentially a theologian and spiritual leader; he had slight interest in political, social or economic questions and his influence upon the political world was very indirect. Nevertheless, the Oxford movement has a close affinity with Disraeli's Young England as well as with other reactionary or romantic trends in Europe which looked sympathetically upon a rejuvenation of ancient institutions.

The Oxford movement did not destroy either the Low Church or the Broad Church group, but it did infuse fresh lifeblood into the Anglican church as a whole and thus helped to restore its waning prestige. The saintliness of Newman's life and the utter sincerity of his confessional writings were important to English Catholicism, for they did much to modify the intolerance of the English people toward Catholicism and to reconcile them to its renewed and active presence in England. Although Newman was a religious reactionary, he was far from being an ultramontanist. Some have even claimed for him the fatherhood of the Catholic modernist movement, pointing to his unmistakable dislike of the doctrine of papal infallibility and his willingness to face the higher criticism and also to the fact that in his *Essay on the Development of Christian Doctrine* (London 1845) he formulated an evolutionary thesis which validates the modernist conception of the progressive unfolding of religious principles and institutions. In addition to his spiritual autobiography, *Apologia pro vita sua* (London 1864, new ed. 1913), Newman wrote voluminously in the fields of religious history and controversy. His most significant historical works are *The Arians of the Fourth Century* (London 1833, new ed. 1895) and *Lectures on the History of the Turks in Its Relation to Christianity* (Dublin 1854).

NEWMARCH, WILLIAM (1820-82), British statistician and economist. Newmarch was a leading critic of Peel's Bank Act of 1844. He collaborated with Thomas Tooke (*q.v.*) in completing the latter's *History of Prices* (vols. v and vi, London 1857; republished in 1928 with introduction by T. E. Gregory). These final volumes, for which Newmarch was mainly responsible, covered the years 1847 to 1856 and were designed not merely to give an objective statistical analysis of the period but also to refute the theories of the currency school on which Peel's act had been based. Newmarch held that the influence of monetary factors on price fluctuations had been greatly exaggerated. If the monetary circulation of a country were increased as a result of additions to its gold and silver stocks, the result would be a stimulus to industry and production rather than a rise in prices. If it were increased by the overissue of bank money, the extra issues would speedily be returned to the banks and prices would again be unaffected. This argument failed to observe that the redundant paper would flow back only in return for gold; prices would then be prevented from rising only if the gold were withdrawn from circulation or exported, in which case the country's reserves would be correspondingly depleted. Nor is it clear why an increase in paper money should have less stimulating effects upon industry than an increase in gold or silver. On the other hand, Newmarch was right in denying the distinction, implicit in Peel's act, between the monetary status of banknotes and of deposits. In his evidence before the Parliamentary Committee of 1857 he argued that as a result of the separation of the issue and banking departments of the Bank of England the gold in the former had been immobilized, while the latter, although equally important as a guardian of the nation's reserves, was being run on narrow commercial lines, with injurious effects upon the stability of the bank rate.

Newmarch was a leading member of the Royal Statistical Society and its president from 1869 to 1871. In 1863 he inaugurated the *Econ*

omist's annual "Commercial History," with its index number of general prices.

NEWTON, SIR ISAAC (1642-1727), English physicist and natural philosopher. As the promulgator of the first great physical synthesis, marking an epoch not only in physical science but in the cultural history of the western world, Newton has obvious sociological significance. He was born in the county of Lincoln, the posthumous son of a yeoman farmer. Educated through the assistance of an uncle, he matriculated at Trinity College, Cambridge, on a poor man's scholarship (1661). He remained at Trinity for more than thirty years, first as student, then as fellow and from 1669 as successor to the mathematical chair of his teacher Isaac Barrow. His genius flowered early, and all his great discoveries—his work in optics, the invention of fluxions or the infinitesimal calculus, and the law of gravitation—were made before he was twenty-five. But except for his optical experiments, they were not perfected or announced to the world until twenty years later on the publication of the immortal *Philosophiæ naturalis principia mathematica* (1687). Exhausted by the strain of this work, Newton sought an occasion to retire from Cambridge and in 1694 accepted the post of warden of the mint, later being promoted to the mastership. Although both of these appointments were in the nature of a reward for his scientific labors, Newton was a conscientious administrator and his work in connection with recoinage and his official reports on coinage occupy an important place in the special history of that subject.

The cultural importance of Newton's *Principia* lies first of all in the fact that it consolidated and brought to a climax the work of the seventeenth century philosophers and scientists toward building up an exact interpretation of

physical phenomena along mathematical and mechanical lines. With the *Principia* the foundation efforts were complete: there was presented a finished system of physical principles, whose power and grip on reality, as evidenced particularly by the solution of the problem of planetary motions, struck Newton's contemporaries as little short of marvelous. This first revelation of the power of scientific method provoked at once a wave of application to other fields of natural phenomena and, not least, to social and political problems. Science was henceforth a cultural force of the first order.

But in addition to presenting the impersonal power of modern science the *Principia* is important because it set forth Newton's own characteristic approach on the disputed problems of scientific method, and many of the cultural repercussions of modern science are directly traceable to the particular emphasis which Newton thus incorporated into science at the very moment when its permanent character was being molded. The Newtonian approach may best be understood by contrast with the approach of Descartes, which it largely replaced. The great French philosopher, although responsible for very few of the empirical discoveries of seventeenth century science, performed a remarkable service by laying down with full philosophic clarity the ideas of mechanism and mathematical analysis as the twin guideposts of the new scientific effort and then by generalizing, on the basis of his method, all the scattered mechanical principles into a coherent system. It is significant that this system, which had a tremendous vogue for more than thirty years, omitted all reference to Galileo's laws of the acceleration of falling bodies, whose importance Descartes underestimated precisely because he could not fit them into the framework of his system. It is also noteworthy that, despite his professed recognition of the testing of rational principles in experience, Descartes' love of system led him to fill out the gaps of verified science with plausible a priori speculation, such as the vortex theory of planetary movements, which Newton was to demolish at one blow by subjecting it to rigorous mathematical analysis.

The Newtonian approach, which seemed to contemporaries to be the diametrical opposite of the Cartesian conception, differed not so much in formal statement of methodological principles as in the emphasis which was given to those principles in scientific practise—but this difference of emphasis was indeed crucial. Newton

was far from being an empiricist in the Baconian sense, for he recognized the importance of rational analysis in addition to experience, just as Descartes acknowledged the importance of experience in addition to reason. The all important fact was that in scientific practise the English thinker was ready to sacrifice more remote philosophical questions to the ability to provide a mathematical correlation of observed phenomena. Thus the specific Newtonian contribution—the doctrine of gravitational attraction as providing both an interpretation of Galileo's empirical laws and a mechanical solution of the heavenly motions—seemed to many of the leading scientists and philosophers to mark a return to the occult entities of the scholastics. The fundamental idea of action at a distance, which gravitation involved, was not only attacked as irrational, but the subsidiary notions of force as an explanation of certain kinds of motion and empty space and time as absolute realities were regarded as barbarously antiphilosophic. That these contemporary objections were not without foundation is abundantly demonstrated by the Einsteinian revolution of our own day. But in the seventeenth century it was a question of choosing between sounder philosophical conceptions, which would have handicapped temporarily the empirical progress of science, and conceptions which were obscure but which provided a highly potent mathematical law for tracing the course of physical phenomena. Newton chose the latter. Indeed he was not even conscious of making a deliberate choice between philosophic clarity and pragmatic serviceability, for every step in the development of his theory presented itself to his mind as the direct and naked revelation of experience. In this too he may be said to have set the style for future scientists. For scientists, in constructing a scientific representation of the universe, have not only always sacrificed all other possible approaches to the interests of empirical prediction of physical phenomena according to the tools at hand, but they have refused even to recognize the existence of other approaches which might be useful either from the point of view of other interests or even from that of the future needs of empirical science.

In the eighteenth century the victory of the Newtonian doctrine and the object lesson afforded by the contrast between the Cartesian theory of vortices and the accuracy of the Newtonian law of gravitation produced that empiricization of rationalism which was so character-

istic of the Enlightenment. Philosophic thought became more and more preoccupied with empirical problems, and this tendency was reflected in turn in the creation of the sciences of politics and economics as well as in much materialistic psychologizing which passed for science. The materialism of Helvétius, Holbach and Diderot and the utilitarian doctrine of Bentham are traceable directly to the victory of Newtonianism. Even Kantian criticism, which was to reestablish the older methods of philosophizing on a new basis, reflects the Newtonian influence: no longer is the attempt made to integrate natural science and moral philosophy into a common and homogeneous system; philosophy must rather accept the formulations of science as a fixed fact and from this starting point inquire both as to the epistemological presuppositions of scientific thought and as to the place, if any, which remains for moral and religious ideas.

NICHOLAS OF CUSA (1401-64), German philosopher. Nicholas was born in Germany at Cues on the Moselle and received his first training in the humanities and in philosophy from the Brethren of the Common Life at Deventer. Later he studied jurisprudence at Heidelberg and Padua and theology at Cologne. He played an important role in the so-called conciliar movement in the Catholic church. At the Council of Basel (1431-48) he drew up the conciliar declarations against the pope. Later, however, he went over to the side of Pope Eugene IV and took an active part in the "union" Council of Florence. He was named cardinal in 1448 and in 1450 was appointed bishop of Brixen—the latter post embroiling him in a long conflict

with Archduke Sigismund. He was a leader in the cause of church reform which he promoted both as bishop in his own district and as envoy on a general mission for the pope in Germany and the Netherlands.

Nicholas was the greatest German thinker of the fifteenth century. His universal genius embraced natural science, mathematics, theology and state and church politics. In all these fields he was able to make constructive and original contributions in which he combined a respect for tradition and a fresh and vital approach to new problems. In his philosophical outlook, which is expressed in his writings *De docta ignorantia* and *De possest*, he followed Plato more than Aristotle; and although he was well versed in scholasticism, he preferred to strike out on the new paths of modern thought—the paths which lead through Giordano Bruno to German idealism and to Schelling particularly. As against the rationalizing theology of late scholasticism Nicholas emphasized the limitations of natural knowledge and championed works of mysticism. In the field of science the same skeptical attitude was instrumental in breaking up Aristotelianism and preparing the way for an experimental science on a mathematical basis.

Nicholas' views on social theory and organization are contained in his treatise *De concordantia catholica*, composed during the first years of the Council of Basel. He regarded human society as a richly differentiated organism with its many members regulated by the life of the whole, and he put forward on this basis a reform program for church and state. In contrast to his later position Nicholas was here a champion of conciliar supremacy. He believed also in the holy mission of the mediaeval imperium and developed detailed plans for its revival—the last grand attempt to reconcile mediaeval universalism and the trends of the dawning modern age and to unite in a higher synthesis tradition and natural law. In respect to church and state as in his philosophy Nicholas stood on the threshold between the Middle Ages and modern times. His powerful spirit spanned the two epochs. In his feeling for historical thought and criticism he was a forerunner of the Renaissance. He was the first to raise doubts concerning the Donation of Constantine and the Decretals of the pseudo-Isidor. He recognized the importance of the study of historical sources and natural science. He thus epitomized an important phase of the spiritual

history of western Europe and he exercised an enduring influence on the periods that followed.

NICOLSON, SIR ARTHUR, FIRST LORD CARNOCK (1849-1928), British diplomatist. Educated at Wimbledon, Rugby and Oxford, Nicolson entered the British Foreign Office in 1870 and served it for nearly half a century, at home or abroad, until his retirement because of delicate health in 1916. After holding various subordinate posts in Peking, Constantinople, Teheran and Sofia, he was appointed British minister at Tangier in 1895 and ambassador at Madrid in 1905. He was the British representative at the Algeçiras Conference, where he handled the delicate questions with great skill and firmness, supporting the French views on the Morocco question and helping to consolidate the newly formed Anglo-French entente. Incidentally he acquired a suspicion and dislike of German diplomatic methods which remained with him ever after.

As ambassador to Russia from 1906 to 1910 he achieved another notable diplomatic success in negotiating the Anglo-Russian convention of 1907 concerning Tibet, Afghanistan and Persia. At St. Petersburg also he was antagonized by what he regarded as Austrian duplicity and German threats in the Bosnian crisis and this antagonism found expression in his reports. His information, however, was based largely on the deceptive statements and bitter complaints

which Izvolsky, the Russian foreign minister, poured endlessly into his ear.

Nicolson loved the Russians and only reluctantly gave up St. Petersburg to become permanent undersecretary at the Foreign Office in London during the following six years. As adviser to Sir Edward Grey he used his influence to draw England, France and Russia more closely together and in 1914 to bring Great Britain into the World War. After his resignation he urged a moderate and just peace settlement; he regarded the Versailles peace negotiations with apprehension and condemned the "war guilt" clause as undignified and meaningless.

Gooch and Harold Temperley, vols. i-viii, xi (London 1926-32), which contain Nicolson's more important diplomatic dispatches, minutes, and some private letters; Nicolson, Harold, *Sir Arthur Nicolson, Bart., First Lord Carnock* (London 1930).

NIEBOER, HERMAN JEREMIAS (1873-1920), Dutch social anthropologist. Prior to the appearance of his classic work, *Slavery as an Industrial System* (The Hague 1900, 2nd ed. 1910), Nieboer was a student of law at the University of Utrecht. Making skilful use of the inductive method of Tylor and Steinmetz he collected a vast amount of descriptive material from all parts of the world; he then classified according to economic stages the instances where slavery has been found and where it has been non-existent and finally formulated from these comparative data the reasons for its presence or absence. He concluded that slaves were not of much use to hunters, their presence in this stage being practically confined to the Indians of the north Pacific coast of North America, where fishing supplied an abundance and variety of food, where the tribes had the advantages of fixed habitation, trade, property and wealth and where the condition of the women and the methods of warfare furthered the development of slavery. He found slavery to be of very little economic importance among pastoral peoples, who as a rule had little wealth; its occasional presence among them he attributed to secondary causes. The development of agriculture he regarded as creating social conditions conducive to the spread of slavery, which in this stage depends largely on the existence of free land. His general conclusion was that where subsistence depends upon "closed resources," that is, where

there is a limited supply of capital or land resources, the use of slaves cannot be permanent; while among people with "open resources," on the other hand, where labor is the principal factor in production, slaves are economically profitable when their subsistence is easily acquired. In his discussion of the transition from serfdom to freedom in western Europe he revealed the inaccuracy of Hildebrand's theory that natural economy leads to serfdom and money economy to freedom. Nieboer also wrote on population problems among primitive peoples.

NIEBUHR, BARTHOLOMÄUS GEORG (1776-1831), German historian and statesman. Niebuhr was born in Copenhagen, of German parents, but was brought up in the province of Holstein. He studied at the universities of Kiel and Edinburgh and in 1800 he entered the service of the Danish government. In 1806 he was invited by Baron vom Stein to come to Prussia, where he was particularly active in the administration of currency problems. He participated in the establishment of the University of Berlin in 1810-11 and was ambassador to Rome from 1816 to 1823. From 1823 to his death he lectured at the University of Bonn.

Niebuhr's chief significance is in his contributions to the development of modern historiography. His works on the history of ancient Rome mark the beginning of modern historical method based on the critical investigation of sources. He went beyond the methods of the eighteenth century philologists, whose textual criticism was concerned merely with the discrepancies between the various ancient authors. Niebuhr inquired into the historical and logical possibilities of the reported facts and legends and sought to reconstruct, out of these materials, a picture of Roman political and social development.

Niebuhr's historical thought presents a mixture of elements of systematic rationalism and historical organicism. He started with the institutions and sought to provide an explanation for them in logically recognizable relationships. He

was particularly fond of the use of analogies and compared history, with its reconstruction of a whole out of incomplete and traditionally transmitted parts, to mathematics. The combination of practical political activity with scientific work, which was characteristic of Niebuhr's whole career, is evident also in his historical works. There is an ethical tone that pervades all of his writings. He aimed to produce a history in which the relations of the individual and the political and social institutions in the past should be as clearly revealed as they are in contemporary life to the politician. The early period of Roman history was to him the realization, in a most exemplary fashion, of the healthy and proper structure of the state. The fundamentally agrarian character of early Roman history was a condition which he considered indispensable for the healthy life of any people. He considered the incorporation and absorption, during the first centuries of Roman history, of newly formed social classes and conquered peoples into the life of the people as having been carried out in an ideal fashion. It was for this reason that he focused his presentation around the great legal and constitutional reforms. His work also reveals the antirevolutionary character of his political thought which had, from his youth, developed as a reaction to the French Revolution. Since he was more the investigator and original discoverer of an ancient world than the calm observer, his works are cumbersome for the present day reader. The concrete results of his researches have long since been superseded, but only through the utilization of the methods which he inaugurated.

In the development of German intellectual life Niebuhr's influence extends in three other directions. In the movement of renewed preoccupation with classical antiquity he provided the stimulus through which Roman studies assumed their place beside the Greek studies of the neohumanists. In the new historical approach introduced by the romantic movement he called attention to the political institutions of a people. His attention to the life of the people as a whole tied him up with the members of the historical school, but he is not to be identified with the adherents of the doctrine of an unconscious and all pervading folk spirit (*Volksgeist*). By centering his emphasis on the state and the political life of the citizens he impressed on German historiography a political consciousness, which, enforced by other influences, is evident in the works of Dahlmann and Treitschke. He

also may be said to be a sort of precursor of the Prussian school of historians. He was a passionate adherent of Prussia and published many articles in which he called upon Prussia to assume the leadership in the political education of the German people. Niebuhr's economic ideas were scattered in various memoranda and letters and through his historical works, and therefore proved of no decided influence on the history of economic science. They were, however, important in influencing the financial and agrarian policy of the Prussian government, especially during the period of the reforms.

DIETRICH GERHARD

Important works: *Römische Geschichte*, 3 vols. (Berlin 1811-32; new ed. by M. Isler, 1873-74), tr. by J. C. Hare and C. Thirlwall (new ed. London 1855-60); *Vorträge über die römische Geschichte*, ed. by M. Isler, 3 vols. (Berlin 1846-48); *Vorträge über römische Alterthümer*, ed. by M. Isler (Berlin 1858); *Vorträge über alte Geschichte*, ed. by M. Niebuhr, 3 vols. (Berlin 1847-51); *Geschichte des Zeitalters der Revolution*, 2 vols. (Hamburg 1845); *Nachgelassene Schriften nicht-philologischen Inhalts* (Hamburg 1842); *Forschungen zur internationalen Finanz- und Bankgeschichte*; *B. G. Niebuhr als Finanz- und Bankmann*, ed. by A. Trendelenburg (Berlin 1929). Most of Niebuhr's lectures on history have been translated and edited by Leonhard Schmitz in *Collected Lectures*, 8 vols. (London 1852-53). The old collection of his letters, which was translated by S. Winkworth (New York 1852), has now been superseded by the new definitive edition, *Die Briefe B. G. Niebuhrs*, ed. by D. Gerhard and W. Norvin, vols. i-ii (Berlin 1926-29), with a long introduction by Gerhard.

NIETZSCHE, FRIEDRICH WILHELM (1844-1900), German philosopher. The son of a Protestant pastor, Nietzsche derived from his clerical upbringing a certain religious seriousness which is apparent even in his most vigorous attacks on religion. Under the guidance of the Hellenist Friedrich Ritschl at Leipsic and later at Bonn he succeeded in emancipating himself from Lutheran orthodoxy and from the Prussian political romanticism in vogue during the epoch of Frederick William IV. As professor of Greek at the University of Basel from 1869 to 1879

Nietzsche came into contact with three outstanding men—the historian Jacob Burckhardt; Franz Overbeck, a specialist in the history of Christianity; and the palaeontologist Rüttimeyer, who initiated him into neo-Lamarckian doctrines. His greatest good fortune, however, was the intimacy which he formed with Richard Wagner, whom he used to visit at Tribschen, near Lucerne. After 1879 he led a wandering life, passing his summers in the Engadine and his winters at the Riviera of Genoa or Nice. He became insane in January, 1889, while he was at Turin.

Although Nietzsche's professional interest was philology, it soon became evident that the dominating preoccupation of his life was the analysis and criticism of cultural values. Both in his literary method and in his psychological approach he was influenced by the great French "moralists"—Montaigne, La Rochefoucauld, Pascal, Fontenelle, Chamfort and Stendhal. In his positive ethics, however, he was inspired chiefly by Gobineau and Emerson. There has been much dispute concerning the manner of growth of Nietzsche's philosophy. Although Nietzsche's thought develops with a continuous sweep, psychologically it may be described as always starting out with a great mystical intuition, which illumines for him all reality and upon which he then brings to bear a process of reflection up to the point of disintegrating his original intuition. Nietzsche's written work reveals two mystical periods, each followed by its period of analysis. There are thus four systems all told.

In his "period of the Wagnerian revelation" (1869-76) Nietzsche declared that the greatest century of Greece—that which witnessed the rise of the tragedy from the primitive dithyramb and which created the great Ionian philosophies—had been reborn in Germany through the work of Richard Wagner and Schopenhauer. The great symphonic music of Germany, he said, fills us with the same ecstasy which in Greece stirred the masses whenever Dionysus, the god of death and resurrection, made his appearance. In the Wagnerian drama this emotion evokes dream images which are Apollonian in purity. There were thus for Nietzsche at this period three types of human greatness revealed in culture: the philosopher, the saint and the creative artist. Since neither science nor the state has thus far taken any steps toward developing this greatness through selection, it will be necessary, said Nietzsche, to establish a new institute of culture, an ideal Bayreuth.

The "period of intellectualistic evolutionism" which followed (1876-81) was brought about by Nietzsche's reflections as to the means whereby the new culture could be achieved. Here Nietzsche gradually emancipated himself from Wagner and Schopenhauer. He saw that the methods of science had dealt a fatal blow to the belief in geniuses, heroes and saints and that the new evolutionism had shown that both individual and social morality were governed by morphology and evolution. The root of both was the "will to power." None the less, the greatest force lay in knowledge and the highest value to which humanity could attain was the "freedom of the spirit." The true work of art to be created was a society of free spirits where the state would be deprived of its functions of force (justice and war) and where the present bourgeois order with its multiplicity of national cultures would give way to a pan-European society.

Nietzsche developed a new period of "lyrical affirmation" between 1882 and 1885 in *Also sprach Zarathustra* and in the fragments belonging to this period. In a gospel written in poetic prose the prophet Zarathustra teaches two mysteries, that of the "eternal recurrence" and that of the "superman." In the name of these two mysteries he announces a new era, a new morality more generous than the ethical doctrines advocated in the past, the downfall of the present conventional values and the advent of unsuspected forms of human greatness.

A new critical reflection on the "values of decadence and renaissance" which Nietzsche had thus affirmed constituted his fourth philosophy and occupied his last active years (1885-88). This time the reflection did not disintegrate the results of the mystic intuition but confirmed them. He believed that the notions of the "eternal recurrence" and the "superman" could be proved scientifically. The primitive social fact in every civilization was for him the act of a horde of blond beasts who installed themselves as masters over weaker populations and reduced them to slavery. There have always been and always will be masters and slaves. Each of these classes has its ethics and its gods. The masters create a warlike ethics, out of which there develops by a process of selection the true nobility, the grand courtesy and the chivalrous bravery of the aristocratic ages. Those who are obliged to serve invent a morality of humility and later, rising in resentment, invent a morality of equality. Among the Greeks the god of superabundant force was called Dionysus. On the other

hand, among the plebeian masses of Asia Minor there developed the cult of the crucified god. Through miscegenation and preaching of the gospel this ethics of humility and equalitarian revolt has spread over the whole world. It ruined the Renaissance through the Reformation and the French aristocracy through the revolution; it is still propagated today by socialism. It corrupted the aristocratic philosophy of Descartes with the Jewish poison of Spinoza and Pascal, the great art with neo-Christian romanticism. Thus also was Richard Wagner corrupted.

But a renaissance is possible through a new enlightenment, through a science which will emancipate us both from time and from gravitation. A biological selection consciously organized will produce an aristocracy of a purer and more vigorous blood. This new class of masters, which will live by the subjection of an immense class of slaves, must not be regarded as a new species; rather are the two regenerated classes, the masters and the slaves, destined to produce by symbiosis a great social organism, an immense collective soul, in which they will commune with one another in a lyrical ecstasy: it is this collective state of mind propagated by mutual suggestion that Nietzsche calls the "superhuman life."

A new synthesis is to be realized in this superhuman life: not the synthesis of Dionysus and Apollo, which was that of Greece and which remains an acquired heritage, but the synthesis of Dionysus and the crucified god, for which the whole classical philosophy of Germany since the days of Goethe and Hegel has striven in vain.

Although Nietzsche left no school of disciples—the aesthetic character of his philosophy made a conventional academic school impossible—the influence of his doctrines has been tremendous and has been felt in the most diverse branches and levels of cultural life. It is possibly in German literature that the most authentic Nietzschean inspiration is to be found. The works of such lyrical poets as Hermann Conradi, Julius Hart, Johannes Schlaf, Richard Dehmel, Alfred Mombert and Stefan George continue the Nietzschean striving for a synthesis of Dionysus and the crucified Christ. In philosophy, while no systems have been erected on a purely Nietzschean base, the contemporary preoccupation with the problem of values and the refusal to accept the traditional values as they have come down from Christianity and post-Kantian idealism reflect the success of

Nietzsche's polemics. In Germany those philosophers who seek to trace the phenomenology of ethical values and types, as, for example, Max Scheler, Nicolai Hartmann and Friedrich Würzbach, consciously follow in Nietzsche's footsteps. In Anglo-Saxon countries, on the other hand, the philosophers of pragmatism and instrumentalism, if they do not retain Nietzsche's method, rely on his devastating criticism of absolute values to bring home their plea for an experimental and humanistic ethics.

In politics the repercussion of Nietzschean ideas has been complicated by confusions based on misunderstandings and caricatures of the doctrine of the superman. For a long time in popular circles Nietzsche's doctrine was both condemned and praised as an apology for conservative pan-Germanism and militarism. Democrats and socialists particularly resented his attacks on the democratic ideal and the "slave morality" of the plebs. Yet there have not been wanting philosophies of democratic socialism which trace their kinship to the Nietzschean ideal of the superman. One may mention in this connection Mutzschler in Switzerland and David Koigen and Gustav Landauer in Germany. Socialist philosophies of direct action also claim a Nietzschean inspiration, as, for example, the Spartacist movement of 1918 and now, on the opposite side, Hitler's National Socialist party.

NIEUWENHUIS, FERDINAND DOMELA (1846-1919), Dutch revolutionary labor leader. Nieuwenhuis, a clergyman and the son of a clergyman, was the founder of the Dutch socialist movement. Impressed by the misery of the working class and the need for social change, he abandoned the church and in 1878 started the first socialist labor paper in Holland, *Recht voor*

allen. For years Nieuwenhuis, with indomitable energy, courage and self-sacrifice, carried on the struggle for socialism practically unaided. The economic crisis of the 1880's strengthened the socialist movement and there followed many prosecutions of radicals. In 1886 Nieuwenhuis was convicted of lese majesty; the harsh treatment he received during his seven months' imprisonment aroused mass protest and greatly increased his influence among the workers. Two years later he was elected to parliament, where he served until 1891, engaging in sharp polemical contests with his colleagues and stressing uncompromisingly the revolutionary aspects of socialism. Nieuwenhuis was a prominent delegate to the congress of 1889 which organized the Second Socialist International; at the subsequent congresses of 1891, 1893 and 1896 he led the movement for a firm antimilitarist policy and the use of the general strike against war but met defeat despite the support of the majority of the French and English delegates. He was one of those who opposed the exclusion of the anarchists from the International. Meanwhile his experiences in parliament and his disapproval of the reformism of the German Social Democratic party led Nieuwenhuis to condemn parliamentarism. His attitude produced a split in the movement he had practically created; the moderate party formed in 1894 received the support of the German Social Democracy. He now became an avowed anarchist, declaring that socialism meant only half the salvation of humanity. His influence declined but it revived in 1903, when the workers turned to more militant action. Through his antimilitarist campaign in Holland and throughout Europe he became as influential as Gustave Hervé; but unlike the latter Nieuwenhuis did not abandon his principles. During the World War he combined under his leadership a number of organizations to the left of the Social Democratic party and carried on an intensive antiwar campaign which had a profound effect upon the European peace movement. Nieuwenhuis' funeral was a unique demonstration of the love of the Dutch masses for their first great leader.

Nieuwenhuis was essentially an agitator; he never thoroughly mastered Marxist theory and practise, and his writings with the exception of some propaganda pamphlets were not of high quality. But he was virtually the sole creator of the Dutch socialist movement, one of the first socialist leaders to warn of the dangers of parliamentarism and reformism and an oppo-

nent of war whose influence is still powerful in the labor movement of northern Europe.

NIGHT WORK. *See* HOURS OF LABOR.

NIGHTINGALE, FLORENCE (1820-1910), founder of modern nursing, came of a wealthy family and was brought up to enjoy the most cultured society of Victorian England. From childhood she felt called to help those who were sick and oppressed; but it was only after a long struggle that she persuaded her family to let her leave home, first for short periods of training with German deaconesses at Kaiserswerth, and Sisters of Mercy in Paris, then to superintend a charitable nursing home in London.

In 1854 her friend Sidney Herbert, member of the British government, asked her to take a party of nurses to assist the English army fighting in the Crimea. Female nurses were unknown in British military hospitals; but Florence Nightingale's work at the Scutari base hospitals, and, later, in the Crimea caused them to be recognized as a necessary part of every army. She not only showed what nursing could be, but organized a vast system of relief for the troops, then suffering severely from lack of shelter, sanitation and adequate commissariat. She had to wage a hard fight against ignorant, jealous, routine-bound officials, and, as the result of anxiety and excessive toil, she returned to England in broken health.

From the retirement which this necessitated, she accomplished her most important work. She initiated and guided the movement for training nurses which substituted the modern nursing sister for Dickens' "Sairey Gamp"; planned the modern system of hospital building and administration; and, by her advice to British statesmen in India, saved millions of lives. She was, for many years, a source of inspiration and prac-

tical help to all who were working for social causes in every part of the world. She showed what a woman could do in practical statesmanship and thus helped forward the cause of women's freedom everywhere.

NIHILISM is an intellectual movement which flourished in Russia in the 1860's, and which expressed itself in a revulsion against the tyranny of authority, a rejection of the obligations of traditional morality and the questioning of every general principle and ideal value, all in the name of the freedom of the sovereign individual. The term owed its popularity to Turgenev, who described the hero of his *Fathers and Children* (1862) as a nihilist. This word was seized upon by the public, especially the conservatives, who used it indiscriminately as an abusive epithet; the nihilists preferred to speak of themselves as "new men" or "thinking realists." Outside of Russia nihilism, properly an episode in the development of Russian positivist and radical thought, erroneously came to connote the terrorist activities which culminated in the assassination of Alexander II and indeed the Russian social revolutionary movement generally.

The type that was to be recognized and labeled nihilist made its appearance around 1860. It was representative of a generation in revolt against the ancestral order, soon to be shaken by the emancipation of the serfs and the lesser reforms initiated by the government of Alexander II. Nihilism was in a sense a youth movement, appealing chiefly to the young men and women of the new intellectual class—largely educated commoners—whose ranks were being swollen by the growth of the schools, the development of the press, the rise of the professions. These tough minded, irreverent young people were in violent conflict with the older generation of intellectuals. At their best the "fathers" were gentlemen of delicate sentiments and polished manners, with a taste for art and letters and an appreciation of religious experience and speculative thought. In their rebellion the "children" affected rudeness of speech and behavior, were contemptuous of whatever smacked of refine-

ment and beauty, pinned their faith to science and, observing that the professed idealism of their elders had compromised with serfdom, adopted a ferociously materialistic, utilitarian, positivistic, agnostic viewpoint.

Some of these brash iconoclasts took an interest in political and social questions and indeed talked revolution. Others, and they may properly be considered nihilists, were chiefly concerned with the cultivation of their own personalities, to the end of freeing themselves from the dead hand of the past. Their numbers increased when disillusionment with political action set in, as it became clear that the masses would remain inert and that the government was capable only of paltering half measures. In the years immediately preceding the emancipation, the moderate Herzen had been supplanted as the intellectual leader of the radicals by Chernishevsky and Dobrolubov. In the latter the nihilists appreciated, however, less the enthusiastic democrat than the impassioned essayist who struck blow after blow at the domestic despotism, the blind prejudices and the slothful habits which held over from a slave owning society. As for Chernishevsky, they pored over his prolix articles and his politico-philosophical novel, *What Is to Be Done?* (1863); but what impressed them was not the great populist's faith in Fourierism and in the virtues of the repartitional peasant commune so much as his consistent materialism (to be admired by Lenin), his sober rationalism, his emphasis on the value of science, his tireless championship of Benthamism, his advocacy of the emancipation of woman, above all, the shattering attack upon the theory of pure art which he made by applying to aesthetics the ideas of his master, Feuerbach. Nevertheless, neither Dobrolubov nor Chernishevsky was fully representative of the movement. The clue to the nihilist ideology is contained primarily in the work of several men grouped around the St. Petersburg review, *Russkoe slovo* (Russian word). Chief among them was Pisarev, who burst upon the literary scene about 1860 at the age of twenty.

"Here is the ultimatum of our camp," he wrote in one of his first essays, "what can be smashed must be smashed; whatever will stand the blow is sound, what flies into smithereens is rubbish; at any rate, hit out right and left, no harm will or can come of it." Pisarev's aim was to free the individual from every prejudice, every piety, every obligation, every allegiance to an ideal purpose. He attacked parental au-

thority, preached sex equality and insisted that in intimate relations the claims of duty must yield to the dictates of the heart. Yet he held emotion suspect, an attitude which probably accounts for his animus against the fine arts. Going a step beyond Chernishevsky and Dobrolybov, who regarded the arts from the utilitarian standpoint, Pisarev saw in them merely a futile diversion, although he excepted from this charge the work of a few masters. He noted with satisfaction that poetry was practically extinct and imaginative prose declining (this when Turgenev was at the height of his powers and Tolstoy and Dostoevsky were climbing to the peak of theirs). He wrote that he would rather be a cobbler or a baker than achieve the canvases of a Raphael or the scholarly tomes of a Grimm. His fellow contributor Zaitzev found art actually harmful, since it distracted people from the study of the natural sciences. Of these Pisarev made a cult, chiefly because he saw them as superlatively effective in clearing away the cobwebs of superstition, mysticism and metaphysics. He dismissed all speculative thought as the barren exercise of the schoolmen, and he assumed that the educated man must be a materialist, regulating his conduct by the light of rational egoism. Unlike Chernishevsky, Pisarev was neither a socialist nor a populist; anticipating the inevitable rise of capitalist industry in Russia, he expected progress not from the masses but from the efforts of the civilized minority. Although he admitted on at least one occasion that all decent men should strive for the solution of the problem of "the hungry and the naked," he looked for the settlement of the social question not through changes in institutions but through the increasing enlightenment of the individual.

Nihilism owed its vogue to the fact that it satisfied the urge toward freedom of an age essentially adolescent. To young people who had foresworn the traditional sanctions it offered the allurements of an oversimplified solution of problems of thought and behavior. Naturally it met with strong opposition from the outset. Its followers were a butt for publicists of various shades of opinion as well as for such novelists as Goncharov, Pisemsky, Leskov. Indirectly, Tolstoy's fiction was a denial of the nihilist attitude, and in a sense all of Dostoevsky's mature work combated it as a danger to what he felt to be the real needs and aspirations of the human soul. It was not, however, the efforts of its enemies but its inadequacy as a philosophy of

life which put a speedy end to the movement. The review which was its organ was suppressed in 1866, and two years later Pisarev was drowned; but it is doubtful whether, even without these casualties, it would have survived the 1860's. It reduced life to a meaningless process, intolerable even to its followers, since under their surface cynicism ran a strong current of idealism. They adopted the gospel of materialism with religious enthusiasm and were ready to lay down their lives for Moleschott or Darwin. Further, nihilism failed to satisfy the sense of social solidarity which was alive in the radical youth, despite the lip service paid to egoism. In the next decade men ceased to blaspheme against art and philosophy; if they did not become respectable citizens, they adopted the populist faith in the masses and, fired by a zeal for social justice, turned to various forms of revolutionary activity.

Nihilism did not fail to leave an imprint upon the ideas and manners of the intellectuals. Such traits of Russian life and mentality as easy comradeship between the sexes, frankness in social intercourse, hostility toward aestheticism, all seem to reveal its influence. It is certain that Pisarev, although himself without political interests, rendered his readers receptive to revolutionary ideas, particularly to Marxism, and that with other radical leaders of the period he helped to establish the alliance between revolutionary thought on the one hand and the complex of atheism, materialism, positivism, on the other. It is significant that Communist scholars, while classifying nihilism as a manifestation of petty bourgeois ideology, nevertheless study it carefully and claim its chief exponents as the remote precursors of those who are building the new order.

NILES, HEZEKIAH (1777-1839), American editor and publisher. Niles was born in Pennsylvania and apprenticed in boyhood to a printer. After various journalistic enterprises he began in 1811 to publish in Baltimore the *Weekly Register* (after 1814 *Niles' Weekly Register*). Although he withdrew from its editorship in 1836, the paper was continued by others for over a decade. The large octavo pages of the *Register* were devoted to politics, geography, biography, notices of the arts and manufactures and news of the day, Niles taking particular pains to publish the activities of Congress, public documents and statistical information. The *Register* is a much used repository of information for the student of America's past. Part of its value is derived from the carefulness with which it was edited, part from the fact that in an era of bitter partisanship Niles announced that his paper was "not intended for electioneering purposes." The editor also avoided religious controversies. Although his columns were written with unusual moderation, Niles expressed his convictions. From the beginning the paper represented the rising spirit of nationalism which had appeared in the United States just before the War of 1812; characteristically, therefore, its anti-British tone was pronounced. Niles was also the spokesman of the new industrial class of the nation. A powerful advocate of tariff protection for American industry, he admired manufacturing even when it involved child labor; and he was an enthusiastic supporter of the demand for internal improvements. But on the question of the Second Bank of the United States he exhibited an unexpected sympathy for Jackson's position, despite his belief that the bank was both constitutional and expedient. Slavery seemed to him a great evil and likely to cause "the most horrible catastrophe," but as a citizen of a border state he could sense that an attempted incorporation of the freed Negro into American society must encounter almost insurmountable barriers.

NITRATES. Nitrogen, chemical symbol N, is one of the most widespread and indispensable elements. While its uses in the chemical laboratory and industry are manifold, its major importance to modern civilization lies in its life giving qualities as an essential plant food and its death dealing properties as an explosive. Since nitrogen is a constituent of all animal manures, its use for soil fertilization is as old as systematic agriculture; its value received scientific recognition as a result of the chemical research and field experimentation of Liebig, Lawes and Gilbert, and by the middle of the nineteenth century its fundamental importance to any scientific program of fertilization had become permanently established.

The invention of gunpowder in the western world is generally accredited to the research of Friar Roger Bacon during the latter half of the thirteenth century. By purifying a salt through crystallization from aqueous solutions Bacon obtained potassium nitrate and is believed to have produced the first artificial explosive. Certainly by the middle of the fourteenth century the use of gunpowder was well known. However, although gunpowder became an indispensable instrument of military combat, until the time of the World War the commercial nitrate industry owed its importance primarily to the rapidly expanding demand for agricultural fertilizer.

Although organic nitrogen secured from waste animal and vegetable materials fulfilled a portion of this demand, the South American deposits of sodium nitrate, the only known workable deposits in the world, constituted the major source of supply during this period. Discovered in the first decade of the nineteenth century, these deposits were soon exploited commercially and by 1830 sodium nitrate was being exported. Production remained on a limited scale for almost a half century, but with the acquisition by Chile of complete control of the deposits as a result of the war against Peru and Bolivia in 1879-81 active steps were taken by the Chilean government to encourage intensive utilization of the natural monopoly which had come into its possession. A commission was established to survey and prospect the nitrate fields. On a basis of the quantity and quality of nitrate they contained, particular lands were appraised by the government and disposed of periodically at auction under a special legislative enactment. The industrialization of Europe and America with the accompanying population increase, more

intensive agriculture and consequent more widespread resort to fertilization programs caused capital in large amounts to flow promptly into the Chilean nitrate fields. English capital, first on the ground, was followed rapidly by that of German and other foreign interests and more tardily by Chilean capital in steadily increasing amounts, until by 1913 the last had become the largest single factor in the industry.

Chilean nitrates occur as natural deposits of so-called *caliche*, a mixture primarily of sodium nitrate and sodium chloride, extensive and accessible in character. As the mining and refining processes are relatively simple, despite government ownership of nitrate lands and a policy intended to prevent overproduction, the industry has been almost continuously plagued with overcapacity. The result has been a resort by the industry to control of the cartel type for restriction of output, regulation of prices and allocation of total production among the several producers. Such control has been encouraged by the government. The thirty-year period of exploitation preceding the World War was marked by a succession of such combinations, six in all and each short lived, primarily because of the difficulty of establishing unanimity of interest among the competitive exploiters of a natural monopoly.

While the producers of nitrates, both domestic and foreign, experienced recurring feast and famine at the hands of the industry, the Chilean government as host for long enjoyed an almost continuous banquet. From 1880 until 1930 an export tax ranging from one third to one half the export value of Chilean sodium nitrate, exclusive of duty, and remaining unchanged after 1897 at 3.38 gold pesos of the value of eighteen English pence per hundred kilos (\$12.34 per metric ton with sterling at par), was collected by the Chilean government. This represented the major source of government income, in some years accounting for as much as 80 percent of the total. The economic significance of the industry to Chile, however, transcends its fiscal importance. Nitrate production has been by far the most important single Chilean industry. In 1927 nitrate, including its by-product iodine, accounted for \$72,225,000 of the total value of products of the mines in Chile, amounting to \$153,585,000, which may be further compared with a total value of manufactured products of \$173,218,000. Of far greater importance moreover is its role in Chilean exports. In the decade after the World War the nitrate industry

provided approximately one half (by value) of all exports.

The industry has inevitably been a special object of political concern, particularly since the World War and the resultant increased competition which Chilean nitrate has encountered from by-product and synthetic nitrogen. While in 1913 Chilean natural nitrate represented 47.7 percent of the total nitrogen produced in the world, by 1917 its percentage had fallen to 35.8 percent, according to data published by the United States Department of Agriculture. More important, although production of the Chilean nitrate remained almost unchanged when measured in absolute figures, that of by-product and synthetic nitrogen increased from 470,800 metric tons (nitrogen content) in 1913 to 774,400 metric tons in 1917. This shift in the reliance of the world upon Chile for its nitrogen supply has been even more sharply pronounced in the post-war years, the percentage of the total world production represented by the Chilean product having declined to 14.8 percent by 1930-31. Its absolute volume likewise showed a decrease to 250,000 tons from a total of 431,200 tons in 1917. Meanwhile world consumption of by-product and synthetic nitrogen increased to 1,444,000 tons.

Government solicitude in the immediate post-war period took the form of approval of the organization of the *Asociación de Productores de Salitre de Chile* (Chilean Nitrate Producers' Association), a selling monopoly organized in 1919 and reorganized in 1924 and 1928, designed to bring about stabilization of output and uniformity in price policy. The government not only brought pressure to bear on the producers to enter this combine but also participated in its administration through the appointment by the president of Chile of four of the eighteen directors of the association. The government further assisted the industry by granting favors; for example, special railroad rates on nitrates, petroleum and coal, bonuses to Chilean producers to compensate for price reductions in the world market, and similar aids. Despite governmental assistance, in fact partly by reason of the monopolistic prices which combination made possible, the competitive position of the Chilean nitrate industry has grown more precarious as world output of by-product and synthetic nitrogen has continued its upward trend.

By 1930 the situation had become so distressing that a reorganization of the Chilean nitrate industry was deemed essential. The reorganiza-

tion involved a concentration of control of forty of the forty-five companies then producing nitrate under the newly organized *Compañía de Salitre de Chile*, or *Cosach*, as it has become generally known. *Cosach* represents a partnership of private and governmental interests. Of its total authorized capital stock of 3,000,000,000 pesos (par value of the peso, \$12.165), 1,500,000,000 pesos, representing common stock, was allocated to the government in exchange for nitrate deposits estimated to contain 150,000,000 tons of recoverable nitrate. The balance of authorized stock, 1,500,000,000 pesos, including 500,000,000 pesos preferred stock, was distributed as payment for the properties of the merged companies, chief of which was the *Anglo-Chilean Consolidated Nitrate Corporation*, controlled by the *Guggenheim* interests. Despite the government's ownership of a majority of the common stock, control—subject to governmental veto where national interests were at stake—remained with private holders of stock, who elected eight of the twelve members of the board of directors. Under the terms of the agreement government export taxes were abolished, in lieu of which the government was given bonds to insure it for the years 1930–33 an annual income approximately equal to that currently yielded by the export tax. After 1933 export taxes were to have been compensated for by profits, if realized, on stock held by the government. In addition to the advantages which it was expected that the industry would derive from consolidation of properties and concentration of control, it was anticipated that costs of production would be greatly lessened through substitution of the more completely mechanized and fuel saving *Guggenheim* process in the mining and refining of sodium nitrate for the *Shanks* process then generally utilized by the industry except in the plants controlled by the *Guggenheim* interests. Despite this reorganization, with the intensification of the world depression affairs have gone badly with the Chilean nitrate industry, and they have had serious repercussions on the economic and political life of the entire country. Mechanization has created a grave unemployment problem and participation by the government in a "nitrate trust" dominated by foreign capital has been the target for political attack by dissatisfied elements. Affairs of *Cosach* reached a critical stage in the closing months of 1932, when it defaulted on its bonded interest. On January 2, 1933, a decree was signed by the president of Chile calling for

the liquidation of *Cosach*. This is expected to require two years. A liquidating committee of three members was created to administer the affairs of the company, to assure an orderly conduct of the business and to aid in the formulation of plans for the continued concentration of control in private hands. The new arrangement apparently represents a return to the status quo ante; nitrate lands will revert to government ownership and an export tax will be imposed upon the outgoing stocks.

Before the war the second most important commercial nitrogen carrier was sulphate of ammonia, obtained primarily as a by-product in the destructive distillation of bituminous coal in the manufacture of coke and artificial gas. By-product ammonia in 1913 is estimated to have furnished 41.9 percent of the world's total nitrogen output of 899,800 tons. According to the United States Federal Trade Commission, Germany led the world in both production and consumption of by-product ammonia with an output of 550,000 metric tons of sulphate of ammonia, 500,000 tons of which were domestically consumed. The United Kingdom ranked second with an output of 431,618 tons, only 108,564 tons of which were consumed by the home market. The United States, although ranking only third in domestic production with 87,162 tons, stood second in world consumption, importing 41.2 percent of its total consumption. France ranked fourth in both production and consumption, being a net consumer of sulphate of ammonia.

The World War magnified tremendously the importance of nitrogen. Hitherto, although its uses in industrial and experimental chemistry had been important and varied, its chief practical significance derived from its life giving qualities as an essential plant food. Although the war accentuated the importance of nitrogen in this respect, its death dealing attributes usurped the stellar role. Not only did the World War call for greater quantities of explosives than did any previous military conflict, but with the introduction of modern high explosives the art of war had so developed as to necessitate fixed nitrogen in quantities far beyond all previous requirements. The Central Powers, in particular Germany, cut off from the Chilean nitrate supply, were forced at the risk of impending defeat to expand greatly their domestic output of nitrogen. In 1913 Germany was the largest single consumer of Chilean nitrate. Despite this fact—in truth, partly by reason of it—Germany

led the world in the production of by-product ammonium sulphate and likewise made greater progress in the industrial fixation of atmospheric nitrogen than any other country. Thrown on its own resources for an adequate supply of nitrogen for both military and agricultural purposes, by the close of the war Germany had greatly accentuated its lead in this field. The German output of nitrogen by the cyanamide process, according to data published by the United States Department of Commerce, increased from 5000 metric tons for the year ending April 30, 1913, to 66,000 metric tons in 1918, and the output of direct synthetic ammonia from 7000 tons to 105,000 tons during the same period. Basic to the tremendous expansion in the production of synthetic ammonia was the pre-war research of Fritz Haber of Berlin, whose name has since become associated with the direct synthetic ammonia process, characterized as one of the most difficult chemical engineering feats yet accomplished in industry. This tremendous increase in the production of synthetic nitrogen could not have been attained without governmental assistance, which for the most part took the form of liberal capital advances to private enterprise.

Developments in the allied countries were likewise accelerated by aid from national governments anxious to obtain self-sufficiency in the production of this essential war material. The French Lannemczan cyanamide plant, for example, was a government wartime project, which, however, remained incomplete with the signing of the Armistice. It was later completed and placed in operation under a contract between the French government and the Société des Produits Azotés, a private concern manufacturing cyanamide. Likewise in Great Britain construction was begun by the government on a commercial nitrogen fixation plant during the war and discontinued after the Armistice; the property and designs were subsequently sold to private interests, which completed the plant and put it into operation.

In the United States, although there existed at the beginning of the war a by-product ammonia industry with an annual capacity of about 40,000 tons of nitrogen, the country was entirely dependent on Chile for nitrates: there were no plants for the oxidization of ammonia, and Chile saltpeter was the only source of nitric acid. Before the entrance of the United States into the war provision was made under the National Decause Act of June 3, 1916, for the establish-

ment of plants for the purpose of extracting nitrogen from the air to be used in the manufacture of munitions in time of war and of fertilizers in time of peace. Under authority of this act there were completed by the signing of the Armistice United States Nitrate Plant No. 1 at Sheffield, Alabama, and the nearby Nitrate Plant No. 2 at Muscle Shoals, Alabama. Although neither plant was placed in operation—No. 1 was not a success—these properties together with hydroelectric facilities subsequently completed, collectively referred to as Muscle Shoals, represent an original cost of approximately \$127,000,000. After the Armistice various private concerns offered to modernize and operate these facilities, but such overtures were rejected by Congress. In addition two bills providing for government operation of the properties received presidential vetoes. They remained in 1933 in a "standby" although somewhat obsolescent condition with their future disposition a matter of conjecture.

Meanwhile facilities for the production of nitrogen were greatly expanded in the United States by private commercial firms. This achievement was made possible in part by the utilization of German patents seized as enemy property by the alien property custodian in 1918 and sold to the Chemical Foundation, Inc., organized in February, 1919. The patents were utilized under licenses granted by the Chemical Foundation on a royalty basis. The synthetic ammonia process as practised in the United States is based on the original Haber process; the modifications are so extensive in character, however, that it has come to be known as the American process. The total annual capacity of synthetic nitrogen plants in 1932 was 318,600 tons of nitrogen. Simultaneously the by-product ammonia capacity reached 200,000 tons of nitrogen. Total capacity from these two sources (there is no production by the cyanamide process in the United States although Muscle Shoals Plant No. 2 is a cyanamide plant) is said to represent an excess of 148,600 tons over normal peacetime requirements.

Expansion in capacity for the production of synthetic nitrogen has been similarly marked in the other major industrial countries of the world. Germany, however, has retained the leading position, having a total capacity in 1932 of 860,000 tons, according to data published by the Chemical Foundation, Inc., New York; the Leuna plant at Merseburg, the largest single plant in the world, boasts a capacity of 600,000

tons. France follows the United States with a capacity of 191,000 tons, and England is next with a capacity of 170,000 tons. Holland, Belgium, Japan, Norway, Poland, Italy, Russia, Canada, Yugoslavia, Czechoslovakia, Spain, Switzerland and Sweden follow in the order named with a total capacity of 661,700 tons, making a combined world total for synthetic nitrogen of 2,201,300 tons. Germany likewise leads in plant capacity for the fixing of nitrogen by the formation of calcium cyanamide with an annual capacity of 114,000 tons of nitrogen. Canada, Japan, the United States, France, Poland, Italy, Norway, Yugoslavia, Sweden, Czechoslovakia, Rumania and Switzerland have a combined total capacity of 322,000 tons, making a total world capacity of 436,000 tons. Total annual world capacity for the production of synthetic and by-product nitrogen is estimated to be 3,300,000 tons. Consumption from these sources in 1930-31 is estimated by the United States Department of Commerce to have been only 1,377,000 tons. Although increasing production has been stimulated by desire for national self-sufficiency in war time, the peacetime importance of the nitrogen producing industry still rests largely upon the use of nitrogen in agriculture, which accounted for approximately 90 percent of the total consumption from 1926 through 1932.

Control of the distribution of nitrates has remained fairly concentrated in most countries. Chilean nitrates have customarily been marketed through shipping and trading companies—a few of which have also engaged in production—to manufacturers or distributors of fertilizers. In the United States by-product ammonia has been marketed largely through a single selling agency, the American Coal Products Company and its successor, the Barrett Company, now a constituent of the Allied Chemical and Dye Corporation; and in England, through the British Sulphate of Ammonia Federation, Ltd. The production of synthetic nitrogen has grown up as a branch of the chemical industry; more than half the total American output is under the control of a single concern, the Atmospheric Nitrogen Corporation. The I. G. Farbenindustrie dominates production in Germany. The several German producers moreover are associated for the sale of their product in the Stickstoff-Syndikat, a body which allocates quotas and fixes prices. Imperial Chemical Industries, Ltd., dominates production in England. French production is less concentrated.

As world capacity for the production of synthetic nitrogen has increased, the price trend has been sharply downward. Demoralized markets have inevitably led to organized attempts at curtailment of production, allocation of markets and fixing of prices on a world wide basis. In the summer of 1929 a tripartite agreement regarding prices and cooperative marketing endeavors was consummated between the Chilean producers of sodium nitrate and the German and British producers of synthetic nitrogenous products. In the summer of 1930 a second agreement involving allocation of markets and quotas, restriction of output and a common price policy was entered into, including in addition to the producers of Chile, Great Britain and Germany the other major European producers and controlling in the aggregate 98 percent of the European production of nitrogen and 80 percent of the world output. This pact, which expired in 1931, was not renewed despite prolonged and earnest negotiations. Failure to renew it is said not to have affected the "close cooperation" which had already been established between Imperial Chemical Industries, Ltd., and the German synthetic nitrogen producers. The world competitive situation has grown progressively more intense, however, as consumption has continued to shrink and capacity to expand.

Failure to renew the cartel agreement has been followed in many countries by numerous governmental restrictions on the nitrogen trade in the form of prohibitive import duties and requirement of import licenses for specified nitrogenous products. Meanwhile, despite ubiquitous demoralization in the industry with low prices, large stocks, high overhead and unutilized capacity, a heightened sentiment of nationalism is contributing toward further expansion; programs for the development of a domestic supply are under way in Latvia, Hungary, Bulgaria and Greece.

In 1898 at a time when Chilean output of commercial nitrogen represented an almost complete world monopoly Sir William Crookes, estimating that Chilean supplies would be exhausted within less than a quarter of a century, forecast a world shortage of nitrogen. Present total annual world capacity for the production of nitrogen from all sources is estimated to be in the neighborhood of 4,000,000 tons, while world consumption of pure nitrogen in the peak year, 1929-30, was estimated at 1,950,800 tons. By 1930-31 consumption had fallen to 1,621,000

tons, but capacity is still on the upswing. The supplies of Chilean nitrate, which have been greatly extended, are now regarded as adequate for more than a hundred years, and synthetic nitrogen from the atmosphere is inexhaustible. The world nitrate outlook is no brighter today, however, than it was in 1898; the plague of overcapacity is no less disturbing than the fear of future shortage. Prosperity in the nitrogen industry, dependent though it is on a return of world prosperity, would seem in addition to demand far reaching and difficult internal readjustments. Nitrogen repeats the challenge of the social control of industry.

NITZSCH, KARL WILHELM (1818-80), German historian. Nitzsch, who was the son of the philologist Gregor Wilhelm Nitzsch, was born in Zerbst. He studied first in Kiel and then at Berlin under Niebuhr and Ranke. He taught at the universities of Kiel, Königsberg and Berlin. Nitzsch early became interested in the study

of economic history, and his first work *Die Gracchen und ihre nächsten Vorgänger* (Berlin 1847) dealt with the economic conditions in Rome during the period of the Gracchi. He combined with his interest in economic history a preoccupation also with problems of legal and constitutional history, which led him to a study of the Hohenstaufen period. In his *Ministerialität und Bürgertum im 11. und 12. Jahrhundert* (Leipzig 1859) he investigated the relations of the bourgeoisie and the class of functionaries in the Middle Ages. He set up the hypothesis that the free bourgeoisie class was essentially an outgrowth of the functionary class and that the town constitutions were derived from the *Hofrecht* of this class. This thesis was later successfully attacked by Georg von Below; but if the problem is viewed in its broader social and cultural aspects rather than from a purely legal standpoint, it must be recognized even today that Nitzsch was right in many respects. Nitzsch also contributed many valuable monographs on the history of the upper Rhine region, on the extension of the Truce of God and on the old merchant guilds. His most important works are his two posthumously published studies, *Geschichte der römischen Republik* (ed. by G. Thourret, 2 vols., Leipzig 1884-85) and *Geschichte des deutschen Volkes bis zum Augsburger Religionsfrieden* (ed. by G. Matthäi, 3 vols., Leipzig 1883-85). The latter work is particularly important for its penetrating treatment of the interconnection between cultural, political, social and economic problems as well as of problems of religion and art. Nitzsch thus played a prominent role as an influence on the development of new trends in intellectual history, without, however, losing sight of the significance of political developments. He preserved a balanced harmony in his general historical surveys, stressing the general forces of historical development but at the same time allowing for the influence of leading personalities.

NOBEL, ALFRED BERNHARD (1833-96), Swedish inventor and industrialist. Nobel was the founder of the modern explosives industry. In 1863 he found a means for the practical use of nitroglycerin, discovered by Sobrero in 1846

and forgotten; several years later he eliminated the characteristics which made its common use dangerous and named the new substance dynamite. Dynamite at first was significant as a powerful explosive in mining and as the classic means of political assault until stringent explosives laws curbed this use. In 1887 Nobel discovered a process of combining nitroglycerin and guncotton (similar to the Vieille process) for the production from guncotton of a powder which was comparatively smokeless and slow burning and, consequently, capable of developing great motive power. The new powder led to the rearming of infantry with quick loading guns and to the introduction of cannon with recoiling carriages, thus completing the revolution in military technique initiated by the inventions of Dreyse, Armstrong and Krupp and creating the prerequisites for the mass rapid firing of the World War.

Nobel himself exploited these and other inventions by establishing fifteen factories in a number of European countries and in the United States. He also acquired large interests in the Baku oil business of his brothers, Robert and Ludwig, who played an important part in developing the Russian oil industry. Nobel was a pioneer of industrial combination in Europe; in 1886 he combined his English and German dynamite corporations by means of an English holding company, the Nobel Dynamite Trust Company, Ltd., the oldest European trust operating on an international scale, with the primary purpose of eliminating competition in the export trade. The trust was dissolved during the World War; in later years the English companies were acquired by the Imperial Chemical Industries, Ltd., and the German companies by the I. G. Farbenindustrie. Nobel's plan to combine the production of artillery, explosives and powder—in 1894 he took over the Bofors cannon works—was frustrated by his death.

Although he did not favor disarmament or unconditional arbitration, believing that the progress of science would make war impossible, Nobel supported the peace movement financially and through his personal influence. Of the five annual prizes of the Nobel Foundation (which received about \$8,000,000, the bulk of his fortune after minor settlements) one is to be awarded to the individual outstanding in promoting international good will and in organizing peace conferences. Of the other prizes three are for the most significant discoveries or advances in physics, chemistry and physiology or medicine, and the

remaining one is for the most eminent literary work of an idealistic character.

NOBILITY. The term *nobilitas* came into use in the later Roman Republic as the designation of the group of influential families which supplied most of the senators and were qualified to hold the higher magistracies. A mixed body consisting of both patrician and plebeian families, the Roman nobility was not restricted exclusively to the proprietors of large landed estates, although on the other hand it was differentiated from the purely moneyed aristocracy composing the equites. It retained a large part of its influence under the principate and formed the social caste out of which the imperial dynasties were for centuries accustomed to be chosen.

In mediaeval and modern Europe the concept of nobility, like so many other concepts relating to occidental government and society, developed in close accord with the Roman pattern. In the early tribes and kingdoms of the Germano-Romanic world, however, the term was even more inclusive than in late antiquity. The early charters and codifications of Germanic folk law often interchange the terms nobleman and freeman with an indifference which seems startling, until it is remembered that the role generally played by these tribes as conquerors of the Roman provinces must frequently have elevated even the common warrior and tribesman to the position of lord over the land of provincial subjects. In regions outside the Roman Empire also the Teutonic freeman often formed part of an original noble caste (*uradel*), the members of which, through their status as patriarchal heads of sibs and clans, dominated, in addition to Celtic and other foreign serfs and dependents, large numbers of landholders of their own race.

Thus from the outset the European nobility was divided into two distinct groups according to the basis of the hereditary privileges differentiating them from the lower orders of the population. The first and more restricted group derived its position from its descent from a limited

number of ruling or dynastic families which, despite considerable differences in economic and political power, adhered rigidly to standards of social exclusiveness and endogamy; the second group developed out of the social functions performed and social status achieved by the first men or families (*primates, principes*) to settle in a community, district or some larger political unit. Something of a conflict between these two principles of origin can be observed down to the break up of mediaeval institutions at the time of the Renaissance. By proof of ancient lineage and freedom the upper nobility based upon the first principle strove to maintain distance from the lesser nobles, who had generally risen in the service of kings and other great officeholders and were very often of servile origin. Particularly durable was the tradition of the freedom of the higher nobility in such institutions as certain great land courts or in ecclesiastical bodies like cathedral chapters and the older monastic orders, which, according to their records, succeeded in preserving intact the standard of noble membership. Alongside the line of demarcation based on origin there existed the more material barriers dividing those nobles who, whatever their ancestry, had managed to retain or achieve political positions of first rate importance from the smaller fry of landholders, like the English gentry and the German junkers, who had to content themselves with economic or at best with inferior administrative functions. Originally purely social in character, the latter distinction also crystallized in the course of centuries into one of blood inheritance and conubium; thus down to the present time only the upper European nobility have enjoyed peerage with the houses of sovereign monarchs and have possessed, for example, the right to intermarry with the rulers of Great Britain and Austria-Hungary.

Two major spheres of activity, corresponding to the two distinct types of lineage and of social privilege, were open to the European nobility, that of local chieftain and landholder and that of officeholder in the households or courts of secular or ecclesiastical princes. In point of fact the two spheres as a rule overlapped, since the local nobility might serve in the central courts and councils in some such capacity as the *Räte von Haus aus* of the German territorial states, while the nobility of office were, even after the introduction of salaries in money or kind, long indemnified for their services by land grants making them the peers of the original landed aristoc-

racy. Nevertheless, the distinction was of permanent significance in the field of local administration, the development of which was marked for centuries by the rivalry between indigenous magnates and royal agents, often inferior in rank but having the central authority at their disposal to buttress their pretensions. In more modern times the implications of the distinction may be discerned in the tendency of noble estates to insist on their peculiar native privileges as the basis of a parliamentary limitation on monarchic or other centralizing powers and influences.

As in all systems of social stratification the position of the nobles as a ruling class was cemented by special advantages or privileges, relating to both the military and civil spheres. Through his command of more advanced techniques of armament and warfare, particularly of the art of fighting on horseback, the mediaeval European noble, like the Asiatic, the Greek and the Roman, was able to sustain or acquire an ascendancy resting on landed or other forms of wealth. Long after the typical feudal army consisting of mounted knights together with retinues on foot had been supplanted by the modern professional army organized and paid by the central authority, the nobles were enabled by their social position to claim all the more important posts of military command. In the civil sphere the special privileges of the nobles developed along similar lines; centuries prior to the conferment of such offices upon them by the central government they were, merely by reason of their social experience and prominence, the natural arbiters, judges and administrators, spontaneously sought out by the surrounding neighborhood, as they still are in the Orient where primitive conditions prevail. When the growing technical complexity of administrative and judicial problems outstripped the capacities of a military and somewhat rustic aristocracy and demanded the employment either of ecclesiastics or of educated members of the bourgeoisie, the only result was the emergence of a new nobility, the *noblesse de robe* of France and the *Briefadel* of Germany.

Certain modern writers have laid stress upon what they regarded as fundamental contradictions in the status and functions of a noble class, particularly upon the inconsistency seemingly involved in the residence of social responsibility in an exclusive caste, whose jealously guarded hereditary privileges and superiority inevitably tended to isolate them from the lower orders of

the population. But such a view does scant justice to the essential nature of a corporative society. In contrast to modern society, which has increasingly tended to dissolve human groups into individuals and only as a second stage to recombine them in classes, the mediaeval or more generally speaking the premodern society was a hierarchy of graduated estates, whose inequality not only failed to hinder their social cooperation but on the contrary was its fundamental presupposition. Each individual found pride and satisfaction in his own place as well as in the place of his superiors and inferiors. A vestige of this attitude may be detected in the famous dictum that "every Englishman loves a lord" and in those American Negroes who "liked your white folks to be superior."

It is a unique feature of the function performed by the nobility and gentry in European civilization that for centuries they bridged the great gulf between country life and the more advanced culture of town life. For this reason it is possible to exaggerate the changes wrought in the structure of society by the rise of the mediaeval city. Despite all the economic, social and political struggles which marked the relations of the landlords with the merchants and craftsmen of the towns, the city of the early Middle Ages, like that of antiquity and of the Orient, was influenced by the nobility no less than the nobility was by it. Modern research has everywhere brought to light the intimate interconnection between the patrician families of the towns and those of the surrounding country; in the lonely and extensively cultivated countryside of eastern Europe as well as in the more densely populated west any nobleman with sufficient means was pleased to spend at least a part of the winter in a town residence, which he usually maintained as his private property.

The social significance of the European nobility was further conditioned by its relation to the modern centralized and national monarchy. Although the tendency common in popular democratic rhetoric to associate the monarchic and the aristocratic principles is by no means founded on error, it is far from containing the whole truth. The relations of monarchy and aristocracy, as of monarchy and church, were characterized by a community of interest based on a common stake in the preservation of the mediaeval corporative society but accompanied by a keen, if sometimes clandestine, rivalry. The modern monarchy must therefore be viewed not only as the predecessor and adversary of modern

democratic and parliamentary forms of government but also as the successor and equally strong adversary of older aristocratic forms of limited government. Surrounded by his peers who were entitled to remain covered in his presence, the old Germanic king could not escape the influence of an aristocracy whose will, whether expressed through an English legislative parliament or a French judicial *parlement*, might at any time intrude between him and the masses. It was therefore his natural policy to assert his sovereignty by cultivating the favor of estates and classes beneath the highest nobility, such as the representative knights and burgesses who were convened in the English House of Commons. Among the causes for the failure of the old German Empire to develop into a national monarchy it is important that its emperors were unable to prevent the electors and other territorial lords from attaining independent sovereignty; but it was at least equally decisive that they could not win the definite support of any of the leading estates—church, gentry or towns—beneath the territorial sovereigns.

The ultimate tendency of the sovereign monarchy of Europe was to reduce all the constituent estates of the realm to a position of equal dependence upon the crown and to assume for itself the function of maintaining a delicate equilibrium between them. By different means and with different degrees of success the English Tudors and Stuarts, the French Bourbons, the Prussian Hohenzollerns and the Russian czars therefore made it one of their principal objectives to bridle the nobles of their respective countries, a process which consisted essentially in converting them, by more or less violent methods, into obedient courtiers, landholders and local administrators. Hence the policy of the monarch had a dual aspect, since on the one hand it manifested distrust of the aristocracy and a corresponding inclination to favor the bourgeoisie and the peasants, while on the other hand it used the same aristocracy to fill most of the important military and bureaucratic posts and to perform all the minor administrative functions by which discipline was maintained among the masses. Richelieu's jealousy of the French nobles, Frederick the Great's vigilance against the junkers, the determined insistence of the last Rurik and early Romanov czars on replacing the old boyar class by a hierarchy of submissive landlords—the *pomeshchiki*—pledged to military and civil service, all point in the same direction. The fact that the rigid and exclusive systems of

hereditary privilege which derived their original sanction from mediaeval feudal law survived into the nineteenth century was due not only to the interest of the nobles themselves in preserving their social position but quite as much to the interest of the monarchs in requiting the latter for their services by some tangible form of compensation. Thus at the same time that the monarch abolished feudal tenures and privileges wherever they obstructed the development of a money economy in military and civil institutions he connived with the nobility to reaffirm its most important legal privilege, the right of undivided inheritance of real estate, which was the foundation of its economic power, whether it took the form of the English law of entail or the more rigid continental form of fideicommissum as it spread from Spain with the rise of the Hapsburg empire. These devices may be viewed as the analogues both of the law of primogeniture which the monarchs developed on their own behalf and of the ancient custom of undivided inheritance for peasant holdings.

In the modern period the role of the European nobility has in general developed according to two distinct, although not discordant, patterns. One of these has been based upon what may be called the survival value of their original social status and function, the memory of which is kept alive even in such romantic customs as the conferment of nobility as a reward for political and social service, a tradition still honored not only in monarchic countries like pre-war Germany, Russia and Austria and present day England and Italy but also in republican France, where the title continues to distinguish old noble families in the diplomatic service. Even in international law the bestowal of titles of nobility, for example, by the papacy, is not quite extinct. And if it is true that a certain natural connection exists between the holding of titles and that of land, the preservation of a class of great landlords in England must seem related to the power of the aristocracy in English society. A second pattern of life has grown out of the various processes by which the aristocracy has modified the mediaeval feudal tradition and adapted itself to modern social activities and pursuits. Thus in England the great nobles have customarily served as members and chairmen of royal commissions and parliamentary committees, in addition to holding honorary offices on the staffs of charitable and other public institutions; and there is hardly a continental country where this practise is unknown. An especially fortunate solution to

the problem of the *circulation des élites*, as it has been called by Vilfredo Pareto, has been made possible in England by the entail system, which has facilitated the absorption of the younger sons of the nobility into lower social strata, while on the other hand the tendency of the larger English commercial and industrial fortunes to flow into land investment has laid the foundations for a steady infusion of new blood into the ranks of the older nobility. Whereas the English system has generally elicited favorable comment, it has not always been recognized that a substantially similar phenomenon existed in pre-war Germany. In those regions of Germany preeminent in mineral resources, such as Silesia and the Ruhr district, the landed aristocracy joined the bourgeois entrepreneurs in the exploitation of this wealth; and in turn the leading families of the industrial bourgeoisie, by acquiring titles and purchasing landed estates, elevated themselves to the social plane of the aristocracy. In addition to the relative modesty of its fortunes this pre-war German aristocracy differed from the English chiefly in the fact that it remained in direct contact with economic production, whether agricultural or industrial, rather than playing the merely passive role of landlordism like the overwhelming majority of the English nobility.

The rationale of the processes by which the European nobility has been metamorphosed or destroyed has varied all the way from the simple formulations of the mediaeval burgesses, who sought to uphold their right to peaceful commerce against the rule of might, to the imposing systems of natural law and natural right which in modern times have constituted the main arsenal for the attack upon the concepts of a privileged aristocracy and of a hierarchical order of society. But in essential motivation as well as in the pith of their argument the protagonists of the struggle against the nobility have from first to last revealed a basic similarity. Almost invariably they have used the ideas of justice, freedom and equality as weapons, and quite as invariably their success has ultimately signified merely the accession of a new group to the ruling classes and the more or less prompt and open negotiation of a compromise between the newcomers and their previous rivals. Far reaching as the attending changes in methods of social control and in economic techniques have undoubtedly been, it cannot be said that in general principle the administration of rural property, which has always represented the economic mainstay

of the nobility, has been modified by any of the new and more commercial elements which have acquired possession of this property since the Renaissance. Even the ruthless extermination and expropriation of the Russian landed aristocracy by the Bolshevik revolution have formed only a brief interlude between the old system of large aristocratic estates and a new system of equally large or larger government or cooperative estates.

In contrast to the anti-aristocratic ideas and sentiments characteristic of the advance of modern liberalism and democracy, the nobility have continued to find apologists in quarters favoring those conservative and traditional forces of which they are the preeminent symbols. A certain rhythm may be discerned in the recurring accentuation of pro-aristocratic feeling, which appears to coincide with the periods of reaction inevitably ensuing upon great social revolutions and characterized by the reconciliation of victors and vanquished. The supreme example of a government stabilized on the basis of conservative and aristocratic principles was the English constitution during the interval between the glorious Revolution of 1688 and the French Revolution, and it is not surprising that as reflected in contemporary thought from Montesquieu to Burke, who were in fundamental accord in their antipathy to French centralization and bureaucratic étatism, such a condition should have generated a chain of political and social ideas as far removed from democratic despotism as from liberal laissez faire. As represented by thinkers so different as de Maistre in France and Karl vom Stein in Germany, the recrudescence of these ideas in the Restoration following the Napoleonic wars was by no means a mere fleeting phase of the romanticism so loudly anathematized by nineteenth century liberals. Deeply bound up with such organic conceptions of society as underlay the doctrines of Saint-Simon and Lamennais, the seemingly atavistic notion of a Christian social hierarchy lingered on in the form of an undercurrent, until it became reincarnated in the syndicalism of Sorel and the corporatist state of Fascism.

NÖLDEKE, THEODOR (1836-1930), German orientalist. Nöldeke studied at the University of Göttingen, to which he returned as instructor after devoting several years to research on oriental manuscripts in Vienna, Leyden, Gotha and Berlin. Subsequently he taught at the University of Kiel and later at Strassburg, which became the center of oriental studies during his professorship there. He was the leading figure in this field in Germany during the latter part of the nineteenth century and the first two decades of the twentieth. Most of the German orientalist and many foreign, especially English and Americans, were his pupils.

Nöldeke's work, comprising almost seven hundred books, pamphlets and articles, is distinguished by an unusually profound and extensive knowledge of languages and of history and by a sound critical point of view which often approaches skepticism. It was his aim to lay solid foundations for western knowledge of all

periods in the history, culture, literature and languages of the Near East. He refused to accept unauthenticated material, but his mind was always open to new developments and he hoped that future investigations would add to the store of definitely established facts. With the *Geschichte des Qorâns* (Göttingen 1860; 2nd. ed. vols. i-iii, Leipsic 1909-29) he inaugurated the modern critical study of the sacred book of the Moslems; together with *Das Leben Muhammads* (Hanover 1863) it constitutes a valuable contribution to Islamic studies. His Syriac, modern Syriac and Mandaean grammars are the corner stones of Aramaic philology. In *Geschichte der Perser und Araber zur Zeit der Sasaniden* (Leyden 1879) he translated and profusely annotated parts of T'abari's chronicle, which gives a vivid picture of the last centuries of ancient Persia; while *Das iranische Nationalepos* (Strasbourg 1896, 2nd ed. Berlin 1920; tr. by I. Bogdanov in K. R. Cama Oriental Institute, Bombay, *Journal*, no. vi, 1925, p. 1-161) is the standard work on Firdausi's *Shahnameh*. His *Orientalische Skizzen* (Berlin 1892; tr. by J. S. Black, London 1892) includes a brief survey of Islam and a description of a slave rebellion in the East. His article "Semitic Languages" (in *Encyclopaedia Britannica*, vol. xxiv, 11th ed. 1911, p. 617-30; enlarged German ed. as *Die semitischen Sprachen* 2nd ed. Leipsic 1899) is a masterpiece of popular philology.

NOMADS. Nomadism involves the repeated shifting of the habitat of a people in its search for subsistence. It does not consist in unrestricted and undirected wandering but is focused around temporary centers of operation, the stability of which is dependent upon the food supply available and the state of technical advance, which determines the extent to which the resources can be utilized. It assumes different forms according to the method of obtaining food and according to climatic and topographic conditions; there are hunting and collecting nomads, pastoral nomads and, in a few instances, agricultural nomads.

Nomadic hunters and collectors are as a rule organized into small related bands, parts of which live or operate in adjacent areas and assemble and function from time to time as a unit either in economic or in ceremonial activity. The number of families aggregated in one camp is determined largely by the game available and changes from season to season and from year to year. For example, if herds of musk oxen or a large number of seals are found in a certain vicinity by the Eskimo, scores of families dwell together temporarily and disperse when the season is ended; the following year the same place may be almost deserted and the families concentrated at another locality because of exhaustion of the food supply or migration of the animals. Australian aborigines have wandered long distances from the interior of Victoria to the coast and returned to take advantage of the season's best crops, fish or game. The Bushmen on the steppes of south Africa organize their temporary settlements around water holes. American Indian hunters and the prehistoric inhabitants of Europe and Asia led a nomadic existence which involved shifting of residence because of the changing food supply.

Hunting and collecting necessarily require extensive areas of land, since available plant and animal life can be utilized only in a most superficial manner. The food supply is rarely regular; periods of plenty are followed by periods of prolonged dearth. Hunting nomads usually have little opportunity to acquire surpluses, since repeated shifting of settlement precludes the maintenance and accumulation of wealth. Political life is basically democratic; leadership is generally invested in heads of families. Individuals can in exceptional instances leave their group to affiliate with related groups. The inability of the small political units of hunting nomads to resist the better equipped, more aggressive and more numerous tribes has led to their retreat into remote forest, steppe or polar regions. Several groups of hunting nomads, the Siberian reindeer nomads, for example, have recently adopted pastoral life. Many hunting peoples, such as the Algonquin of North America and some Australian tribes, recognized family ownership privileges over territories upon which the families were regularly accustomed to seek their food; as a rule, among hunters these rights belong to all members of the political unit.

Among pastoral nomads periodic return to particular areas is more systematic than among most hunting nomads; territories regularly ex-

plotted are claimed as tribal property. The practices of pastoral peoples vary according to the nature of their herds or flocks. The Bedouins move with relative speed with their camels and horses over a vast territory from their winter settlements in Yemen almost to the slopes of the Caucasus in the summer. The Masai cattle breeders of east Africa wander long distances over the enormous steppes, moving their kraal every few months to obtain fresh pasturage; the length of their stay is determined by the accumulation of refuse in the camp. The Mongol and Turkish cattle breeding tribes of central Asia likewise travel extensively but return periodically to the same grazing grounds. The herders of sheep and goats in Arabia, on the other hand, merely wander to the boundaries of the desert for grazing grounds and return to their villages. Pastoral nomads retain their herds as wealth, while they live on milk or on some of the young animals or on food derived through exchange. They are therefore relatively more secure in their livelihood than are the hunting nomads; their nomadism lends itself to the accumulation of wealth in herds and flocks, but less in products of handicraft. The status of women among homogeneous clans of pastoral nomads is almost equal to that of men, because of a strict division of labor between the sexes. The care of the herds has remained a masculine occupation among herdsmen who have not been affected by contact with agricultural tribes. The women prepare hides, care for the milk containers and build the houses of the camp. Only in tribes which have acquired women and cattle from other herdsmen do women milk and tend stock. As in the case of the hunters, political life is democratic and social organization is dominated by a council of elders. Occasional large gatherings bring neighboring groups together and friendly relations are cemented by a system of lending and pawning cattle—often paralleled by the education of children by foster parents—a practice especially characteristic of the African herdsmen. These gatherings facilitate interchange of knowledge and experiences between the various tribes. Contact among herdsmen led some to adopt the domesticated animals of other pastoral people; horse breeders, for instance, began to domesticate cattle with the implication of private ownership of the new animals. In other instances the exertion required in times of famine and the vast stretches of barren land which often divide the area of one tribe from that of another tend to prevent communication.

One of the chief means whereby culture is diffused is through marriage with persons belonging to other tribes.

Agricultural peoples may sometimes be regarded as nomadic in the sense that they change their habitat in order to look for new patches for raising their crops. This is particularly true of tribes in which agriculture has been but recently introduced, as, for example, among the Baining of New Britain and other Papuan tribes. Agriculture is carried on primarily by women, while the men remain hunters and trappers. Prior to European contact with Africa unstable residences were common among the Bantu tribes in which the men became cattle breeders: in this and other instances it is difficult clearly to distinguish between nomadism and migration.

Among pastoral nomads exhaustion of pasture land and increase of population may lead to the branching off of a number of families or to the movement of the main stock. If the migration is directed to uninhabited areas, social organizations are not exposed to change. Contact with other peoples, especially between herdsmen and agriculturists, has led, however, to a clash of cultures; the resultant situation depends largely upon the relative number of migrants, the nature of the culture of both groups and whether the contact is peaceful or through conflict.

When the clash of peoples is marked by hostility and the herdsmen slay the men of the agriculturists and spare their wives, as has occurred, for example, among south African tribes, the invaders occupy the land and the women continue the agricultural work; a particularly rigid division of labor between the sexes ensues, the men remaining shepherds. When small families of herdsmen branch off and associate peacefully with agriculturists, as has frequently been the case, for example, in east Africa, they become settlers, sometimes preserve part of their traditions and become political leaders of clusters of families or of clans of agriculturists. When large groups of nomad herdsmen seeking land for grazing purposes come into contact with agriculturists, without its being necessary to deprive the latter of their land, peaceful relations may be maintained and surpluses bartered among initially independent clans. In such instances, however, the herdsmen eventually succeed in exercising domination over the agriculturists by virtue of their possession of cattle. In this way families of the pastoral nomads acquire political leadership, as was done, for example, by the Bahema in central Africa.

The primary consequence is an ethnical stratification of society with several castes, as in the Toro country or among the Banyankole of Uganda. The economic and political power acquired by families of nomadic herdsmen has sometimes led them to adopt a more or less sedentary existence; they have in such cases become attached to and even dependent on the agriculturists, with whom they at first did not intermarry. When later intermarriage became frequent, ethnical stratification turned into social stratification, as in Buganda. Here, during the process of superimposition of nomadic herdsmen upon peasant agriculturists, the original social organization of both was gradually replaced by an aristocratic and despotic administration based on a ranking officialdom, slavery and economic exploitation; in this way the foundation of a state is laid. Hunting nomads have also attached themselves to agricultural peoples and have intermarried with them, giving rise to another type of sedentary people. These mergings of peoples have stimulated increase and diffusion of culture. The buying of wives introduced in the lapse of time during these processes, particularly the acquisition of female slaves, contributed to at least a formal degradation of the position of women and to the rise of patriarchal institutions.

Certain pastoral people have built up military organizations formed on democratic lines, without slaves or social stratification but with rigorous discipline exercised by the elders. In this manner there emerged pastoral brigands, such as the Zulu, Hehe and the Masai of east Africa; the last named extended their raids over hundreds of miles from the Indian Ocean to the shores of Lake Victoria in central Africa, relying on their superior weapons, military training and tactics. The Manchus, Turks and Mongols not only dominated central Asia in this way but also invaded surrounding regions. In some cases these military nomads merged with agricultural groups and formed stratified societies, as in the case of the Manchu conquerors and the Chinese peasants. European influences recently have been responsible for introducing agriculture among the Hehe and to some extent among the Masai, with the result that they have adopted a more sedentary life. In this way the old nomadism is being replaced by other forms of habitation.
